EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

EXECUTIVE SUMMARY

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

State- and tribal - equivalent NPL

RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the RESPONSE list, as provided by EDR, and dated 08/03/2015 has revealed that there is 1 RESPONSE site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
JOINT FORCES TRAININ Status: No Further Action Facility Id: 30490037	***4250 CONSTITUTION AV***	***NNW 1/2 - 1 (0.874 mi.)***	***10***	***20***

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 08/03/2015 has revealed that there are 3 ENVIROSTOR sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

Status: No Further Action

State and tribal leaking storage tank lists

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the State Water Resources Control Board Leaking Underground Storage Tank Information System.

A review of the LUST list, as provided by EDR, and dated 06/15/2015 has revealed that there are 2 LUST sites within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
JERRY GIRAGOSSIAN Status: Completed - Case Closed Global Id: T0605900647	***5262 LAMPSON AVE***	***E 1/4 - 1/2 (0.365 mi.)***	***B6***	***13***

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/10/2015 has revealed that there is 1 RCRA NonGen / NLR site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
DAVID RUTLEDGE	***4533 HAZELNUT***	***SW 0 - 1/8 (0.101 mi.)***	***4***	***11***

EXECUTIVE SUMMARY

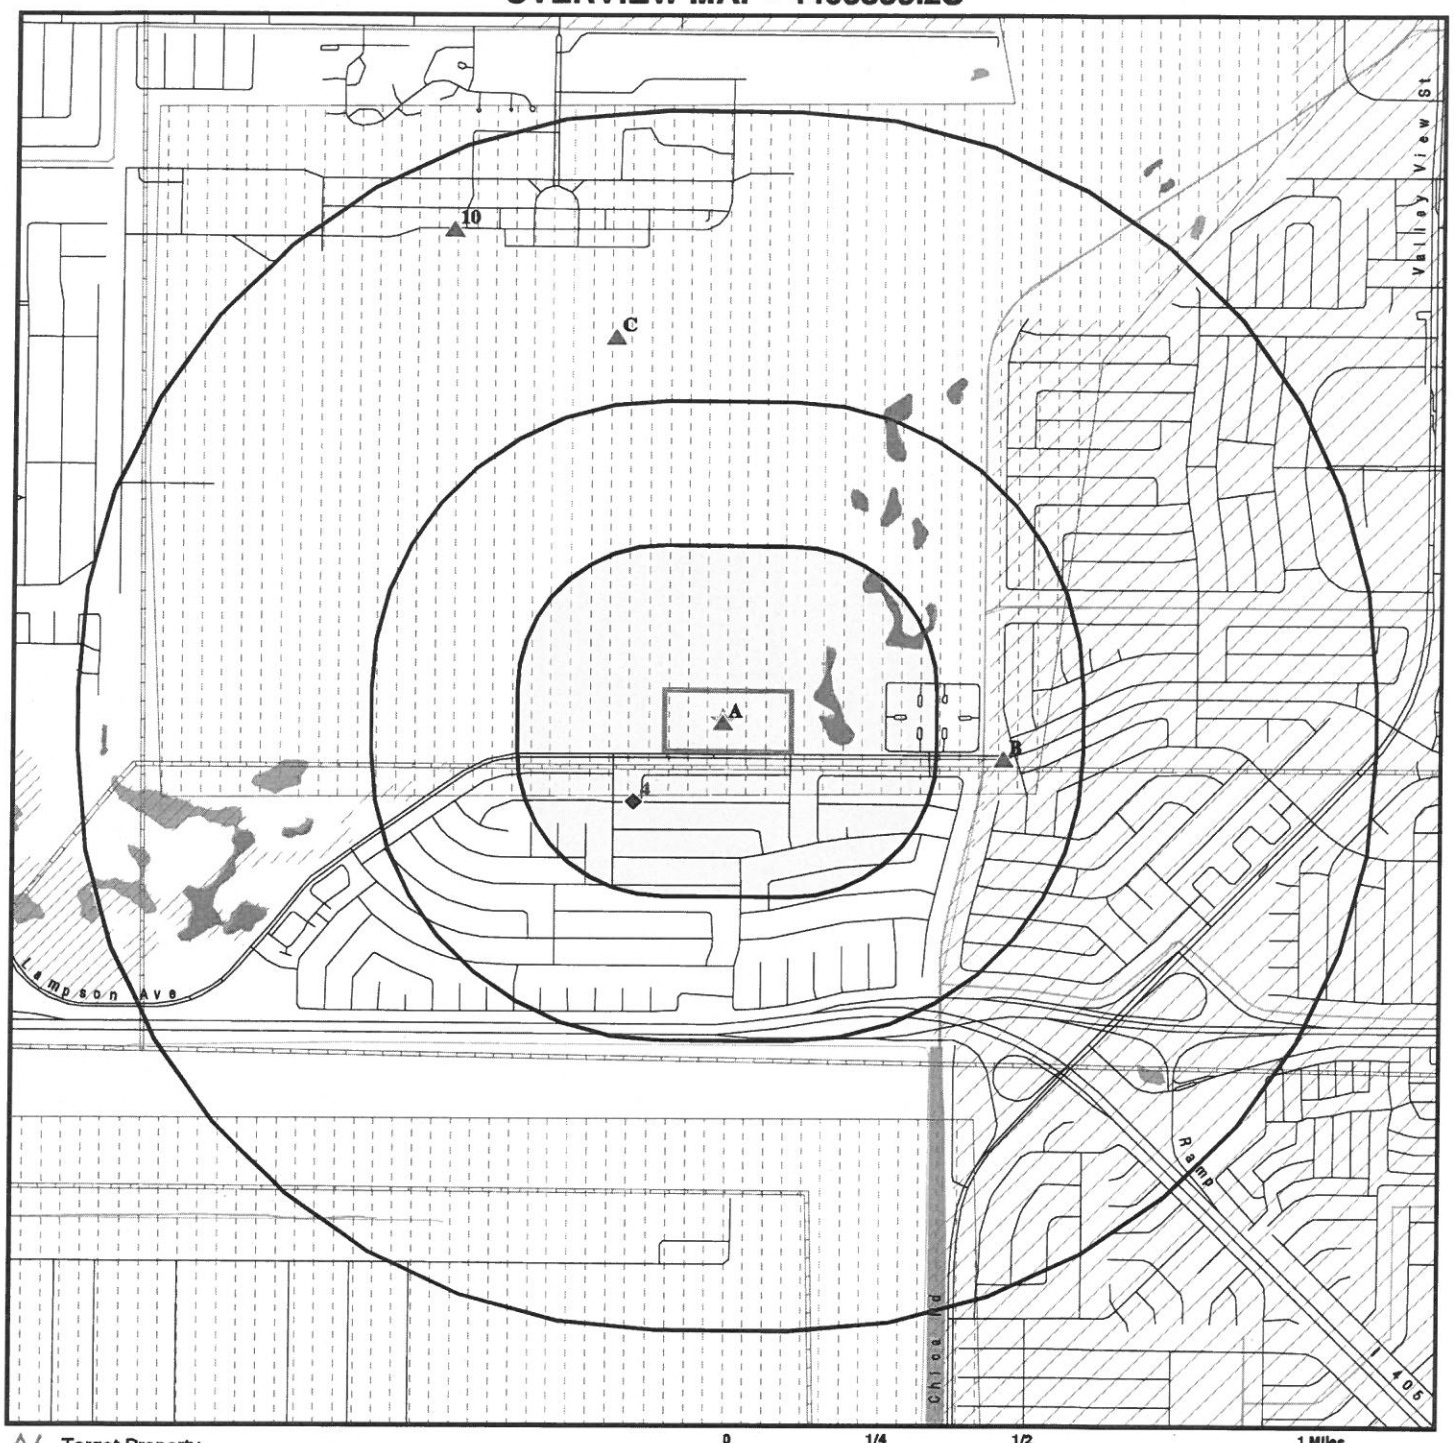
DOD: Consists of federally owned or administered lands, administered by the Department of Defense, that have any area equal to or greater than 640 acres of the United States, Puerto Rico, and the U.S. Virgin Islands.

A review of the DOD list, as provided by EDR, and dated 12/31/2005 has revealed that there are 2 DOD sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
SEAL BEACH NAVAL WEA		S 1/2 - 1 (0.633 mi.)	0	10
LOS ALAMITOS ARMED F		0 - 1/8 (0.000 mi.)	0	10

HIST CORTESE: The sites for the list are designated by the State Water Resource Control Board [LUST], the Integrated Waste Board [SWF/LS], and the Department of Toxic Substances Control [CALSITES]. This listing is no longer updated by the state agency.

A review of the HIST CORTESE list, as provided by EDR, and dated 04/01/2001 has revealed that there is 1 HIST CORTESE site within approximately 0.5 miles of the target property.



Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Potential Contaminants of Concern:	Gasoline, Diesel
Site History:	Building 34 is located in the south-central area of the base. It is the fire station on Enterprise Avenue. Building 35 is located to the west. Building 34 and 35 are in Area of Concern (AOC) 6. Historically six underground storage tanks (USTs) were associated with Building 34. March to May 1994, USTs, two fuel dispensing islands, and 225 cubic yards of petroleum-impacted soil were removed from this release site. June 1990, Site Inspection (SI) reported floating petroleum fuel above groundwater at this site and total petroleum hydrocarbon (TPH) soil concentrations ranging from 86.4 to 26,000 milligrams per kilogram. Four GW monitoring wells were constructed from soil borings. March 1992, SI-Phase II reported groundwater (GW) contaminant concentrations of: 3,350 parts per billion (ppb) benzene (B); 4,430 ppb toluene; 570 ppb ethylbenzene; and 18,000 ppb total xylenes (X). July 1992, additional investigation report GW contaminant concentrations of: 340,000 ppb TPH; 6,300 ppb B; 18,000 ppb T; 36,000 ppb E, 21,400 ppb total X. The Remedial Investigation/Feasibility Study (RI/FS) was initiated in September of 1997. The RI utilized a phased approach to provide flexibility, increased efficiency, and effectiveness of data collection. The report also includes interim remedial actions, human health risk assessment, and recommendations for future actions. During the Phase I RI GW samples were collected from five boring locations at depths of 20-, 40-, and 60- feet below ground surface (bgs). Samples were analyzed for: TPH gasoline and diesel range (TPHg or d), volatile organic compounds (VOCs, analysis includes BTEX), pesticides, and polychlorinated biphenyl. The Draft Final RI/FS Report was issued in February of 2007. In 2002, ten soil sample were collected for human health risk assessment and analyzed for TPH, VOCs and methyl tert-butyl ether. July 1997, an interim remedial action dual phase vapor extraction system was constructed at Building 35. The system included GW/vapor extraction wells placed east of Building 35 to intercept and treat the Building 34 diffused GW plume. This extraction network was upgraded in 2002 all extraction wells were equipped with down-hole pumps. By 2009, twelve monitoring wells were located at Building 34. From September 2006 through March 30, 2007 at trailer mounted vapor and GW treatment system was operated at the site. Treated GW was stored on site and then transferred to the Building 35 treatment system for discharge. May 2007, applications of oxygen release compound (ORC) were performed utilizing direct push injection methods in 44 locations with a treatment zone of 10 to 30 feet bgs. A total of 5,650 pounds of ORC Advanced was applied to the

JOINT FORCES TRAINING BASE, LOS ALAMITOS - BLDG 34 (Continued) **S106387296**

saturated subsurface. Following the in situ GW treatment a long-term GW monitoring program was implemented.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions
The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Local Lists of Hazardous waste / Contaminated Sites

US HIST CDL: National Clandestine Laboratory Register
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 02/25/2015

DEED: Deed Restriction Listing
Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST
EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites
Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)
The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water board?s review found that more than one-third of the region?s active disposal pits are operating without permission.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR US Hist Auto Stat: EDR Exclusive Historic Gas Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR US Hist Cleaners: EDR Exclusive Historic Dry Cleaners
EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

SOUTHWEST REGIONAL LABORATORY
4665 LAMPSON AVENUE
LOS ALAMITOS, CA 90720

TARGET PROPERTY COORDINATES

Latitude (North):	33.782 - 33° 46' 55.20"
Longitude (West):	118.0495 - 118° 2' 58.20"
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	402829.8
UTM Y (Meters):	3738286.2
Elevation:	24 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5633745 LOS ALAMITOS, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

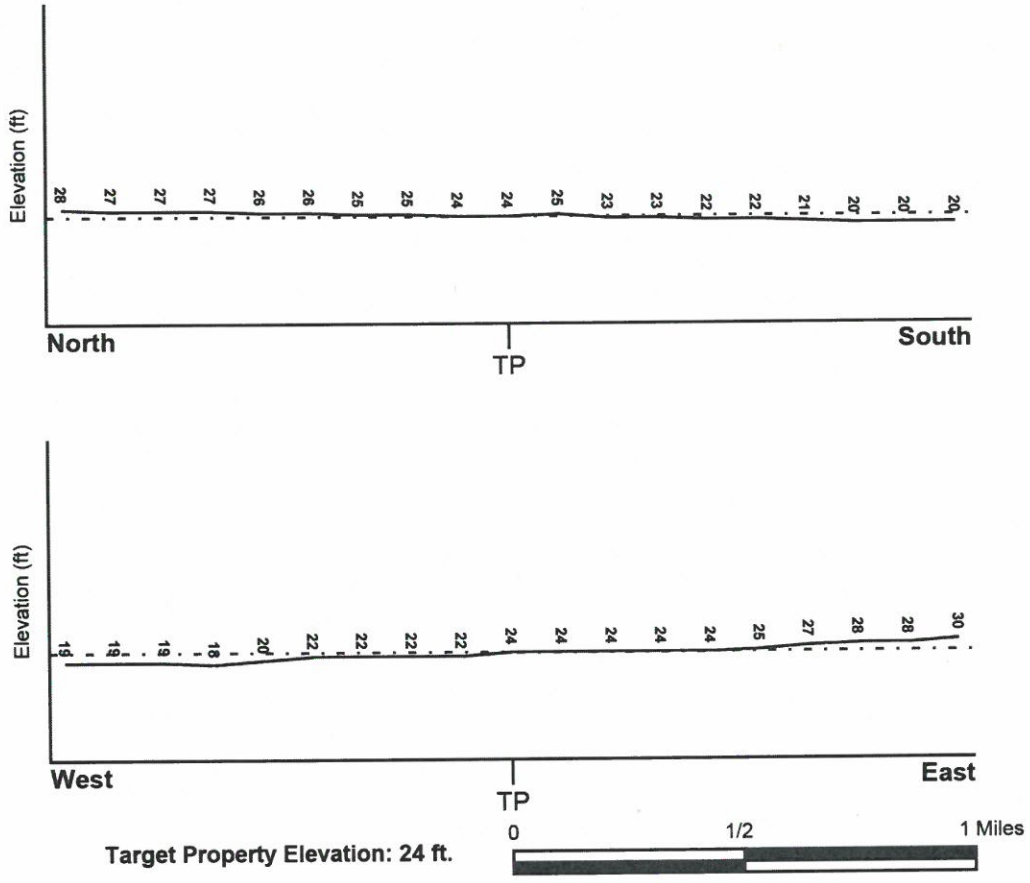
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
ORANGE, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 06059C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
LOS ALAMITOS	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
11	1/2 - 1 Mile WSW	Varies

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site-specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: HUENEME

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	27 inches	fine sandy loam	Not reported	Not reported	Max: 42 Min: 14	Max: 8.4 Min: 7.4
2	27 inches	59 inches	stratified sand to silt loam	Not reported	Not reported	Max: 42 Min: 14	Max: 8.4 Min: 7.4

Soil Map ID: 2

Soil Component Name: Water

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class:

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 3

Soil Component Name: BOLSA

Soil Surface Texture: silt loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	11 inches	silt loam	Not reported	Not reported	Max: 4 Min: 1.4	Max: 8.4 Min: 7.9
2	11 inches	68 inches	silty clay loam	Not reported	Not reported	Max: 4 Min: 1.4	Max: 8.4 Min: 7.9

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Tetra Tech EMI were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

EDR Chain of Title

The EDR Chain of Title Report tracks a line of successive owners from the present back to 1940 of a particular parcel of property, linked together by recorded transactions which pass title. Available nationwide, this report provides a summary of a property's ownership history and is a valuable source for determining the prior uses of a property

A network of professional abstractors following established procedures, uses client supplied address Information to locate:

- Historical Chain of Title research
- Leases and Miscellaneous

Thank you for your business.

HISTORICAL CHAIN OF TITLE

PARCEL NO. 1

Chain 1

According to the Los Angeles County Assessor, the current owner of the subject property is the United States of America. Records were searched at the Los Angeles County Recorder's Office back to 1941. No conveyance was found of record for the subject property. Based on our research, it appears that the United States of America acquired title to the property through eminent domain from the Fred H. Bixby Rancho Co.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Orange County and Part of Riverside County, California
Survey Area Data: Version 8, Sep 19, 2014

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: May 16, 2014—Jul 2, 2014

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

WILLIAM R. GIANELLI
Director
Department of Water Resources

FOREWORD

In 1948, an intensive land and water use survey was conducted on a statewide basis. This information was published in State Water Resources Board Bulletin No. 2, "Water Utilization and Requirements of California", June 1955. The 1948 survey also served as the basis for a more detailed report on the entire Santa Ana River drainage area. This was published as Department of Water Resources Bulletin No. 15, "Santa Ana River Investigation", February 1959.

To bring information on land and water use in the Santa Ana River drainage area up to date, the Department began a new survey in 1957 which resulted in the publication of two bulletins: Bulletin No. 70, "Orange County Land and Water Use Survey, 1957", and Bulletin No. 71, "Upper Santa Ana River Drainage Area Land and Water Use Survey, 1957".

This report, Bulletin No. 70-64, presents land and water use as of 1964 and updates data presented in Bulletin No. 70. Such updating of land and water use data has been carried on since 1957 for different areas throughout the Southern District as set forth in Sections 225, 226, and 232 of the California Water Code.

The Department of Water Resources expresses its thanks to the many farmers of the area without whose cooperation detailed crop mapping would not have been possible.

ABSTRACT

Bulletin No. 70-64 reports that, in the Orange County study area, urban development has been rapidly increasing while the area devoted to agriculture has been declining. / The area of the report encompasses 825 square miles and includes most of Orange County and minor portions of Los Angeles, Riverside, and San Bernardino Counties. It consists of portions of three hydrologic units: Los Angeles-San Gabriel River, Santa Ana River, and San Juan. / Population in the Orange County portion of the survey increased from 516,000 in 1957 to 1,070,800 in 1964. / The gross urban-suburban area (in the entire study area) increased from 69,490 acres in 1957 to 140,590 acres in 1964. The gross agricultural area decreased from 101,920 acres in 1957 to 61,760 acres in 1964. / Net water use in the study area expanded from 244,000 acre-feet in 1957 to 305,400 acre-feet in 1964 -- a 25-percent increase. Urban-suburban net water use increased from 104,100 acre-feet in 1957 to 220,500 acre-feet in 1964, while agricultural net water use decreased from 139,900 acre-feet in 1957 to 84,900 acre-feet in 1964. / Foldout plates depict hydrologic units, subunits, subareas; water-bearing sediments; major water agencies; present land use; and change in land use between 1957 and 1964.

CHAPTER I. INTRODUCTION AND SUMMARY

A periodic survey of land and water use is necessary to provide information on present water requirements and to form the basis of predictions of future water requirements and the need for supplemental water supplies. This is particularly true in an area such as Orange County where the recent rapid growth of population and industry and the resulting decline in irrigated agricultural acreage have created drastic changes in the character and amount of demand for water.

Charting the land uses and water needs in areas such as this began in 1947 when the California Legislature directed the Department of Water Resources and its predecessor agencies to conduct a comprehensive investigation of the water resources of the entire State. Out of this investigation came The California Water Plan -- a master blueprint for management of California's water resources.

Since then, the Department has periodically updated its land and water use surveys to keep abreast of the changes taking place. For example, the investigation reported here, which was conducted in 1964, updates a similar survey made in 1957 in the same area.

Objectives and Scope of Investigation

The major objective of the program, of which this survey is a part, is to provide timely and reliable information on the availability, suitability, and use of land throughout the State for various kinds of water-using development.

The specific objectives of this survey were to develop information on present water use in the study area and to compare present water

use with historical use to determine water use trends. This information will then be used by the Department of Water Resources in continuing studies to compare values of present use with local and imported water supplies to ascertain the need for supplemental water.

This report contains data for Orange County and for small parts of Los Angeles, Riverside, and San Bernardino Counties. These minor areas outside of Orange County have been included because the boundaries of the hydrologic drainage areas extend beyond county lines. A general location map of the study area is presented in Figure 1.

Methods and procedures employed in this investigation are similar to those used in the 1957 survey. A detailed explanation of the classification of land use and conduct of the study is given in Appendix A, and an explanation of the unit value method for estimating net water use is given in Appendix B. For definitions of terms as used in this report, see Appendix C. For a list of references used in this report see Appendix D.

Summary of Findings

The investigation reported in this bulletin disclosed that in 1964, the land in the area of investigation was being put to these uses:

Gross urban and suburban area	140,590 acres
Gross irrigated agriculture area	61,760 acres
Gross water service area	202,350 acres

And this land was found to be using the following amounts of water:

Net urban and suburban water use	220,500 acre-feet
Net irrigated agriculture water use	84,900 acre-feet
Total net water use	305,400 acre-feet

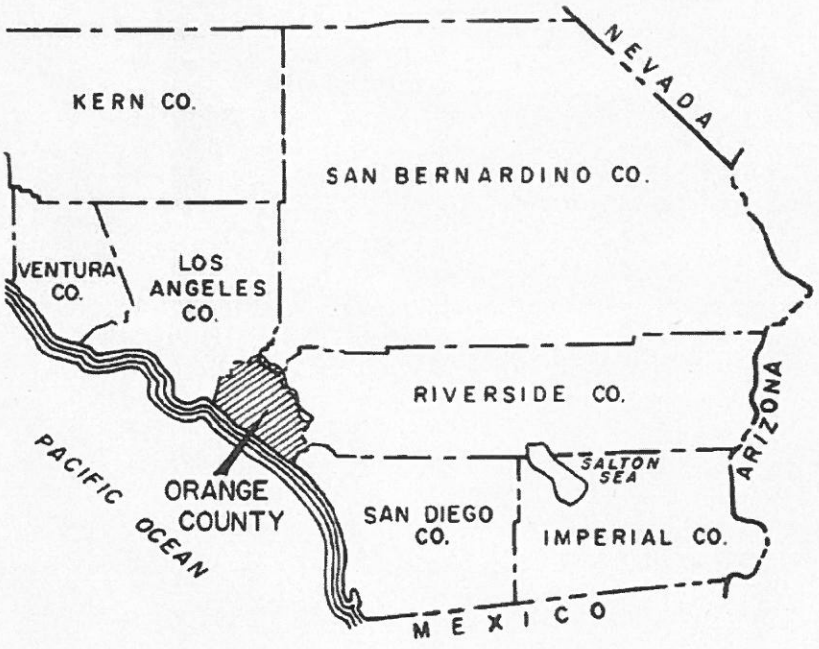

Figure 1. Location of Area of Investigation

The following findings result from the 1964 survey of the study area:

1. The population of Orange County has increased 108 percent since the 1957 survey (516,000 in 1957 to 1,070,800 in 1964).
2. The gross urban and suburban area within the area of investigation increased from 69,490 acres in 1957 to 140,590 acres in 1964, an increase of 71,100 acres, or 102 percent.

3. The gross irrigated agricultural area decreased from 101,920 acres in 1957 to 61,760 acres in 1964, a reduction of 40,160 acres, or about 39 percent.
4. The gross water service area increased from 171,410 acres in 1957 to 202,350 acres in 1964, an increase of 30,940 acres, or about 18 percent.
5. Eight major water agencies encompass 75 percent of the study area and provide service to 99 percent of the water service area.
6. Annual net water use for urban and suburban acreage increased 116,400 acre-feet between 1957 and 1964 -- from 104,100 to 220,500 acre-feet, or almost 112 percent.
7. Annual net water use on irrigated agricultural lands declined from 139,900 acre-feet to 84,900 acre-feet between 1957 and 1964, a decrease of 55,000 acre-feet, or about 39 percent.
8. Overall net water use increased about 61,400 acre-feet, or almost 25 percent, from 244,000 acre-feet in 1957 to 305,400 acre-feet in 1964.
9. The deliveries of water imported to Orange County from the Colorado River increased from 154,200 acre-feet in 1957 to 303,400 acre-feet in 1964.
10. The total seasonal net water use for Orange County by the year 2020 has been estimated to be 804,000 acre-feet. This means that nearly 650,500 acre-feet of water will have to be imported annually to this area in the future.

Conclusions

Based on the results of this investigation, it is concluded that:

1. The population within the study area will continue to increase within the foreseeable future.
2. Irrigated agricultural lands will continue to lose choice acreage to urban and suburban expansion, but a portion of this loss will be offset by new development of lands which previously have been in native vegetation or farmed under a nonirrigated condition.
3. Increasing reliance on importation has relieved, but not solved, the current overdraft conditions.
4. Orange County is undergoing very rapid changes. These changes will require continued periodic inventories of land use to serve as a foundation for future water resources planning and development.

Newport Bay is one of the most intensively used small craft harbors in Southern California.

Newport Bay

PACIFIC AIR INDUSTRIES

CHAPTER II. AREA OF INVESTIGATION

The Orange County study area comprises about 825 square miles. It is roughly rectangular in shape and extends some 37 miles parallel to the Pacific Ocean, with an inland depth of about 25 miles.

The study area is situated in a locale that encompasses many variations in topography, ranging from relatively level land along the coast to rugged mountains along the Santa Ana Range. A short drive through the county will carry one along scenic country roads that pass fields of stubble grain or undeveloped valleys where large oaks shade the highway. Going west, one may pass through a broad plain that stretches to the ocean. This plain is the scene of intense urban and agricultural activity. A highway along the coast takes one along beautiful beaches and unique cities that attract crowds of holiday and weekend visitors.

This flat coastal plain blends into the Coastal Plain of Los Angeles County on the northwest. The north and northeast boundary of the study area runs along the drainage divide of the Puente and Chino Hills. The eastern limits of the study area follow the rugged Santa Ana Mountains. The southeast boundary follows the Orange County and San Diego-Riverside county lines. This last stretch of the study area runs through very hilly and mountainous terrain. The southern boundary borders on the Pacific Ocean.

The internal features of the county are quite variable. The San Joaquin Hills, which are located just inland from Laguna Beach, and the Puente Hills attain elevations of about 1,200 feet and 1,800 feet, respectively. Both ranges are relatively smooth. The Santa Ana Mountains are more rugged and rise to an elevation of 5,700 feet.

The Santa Ana River, the principal stream in Orange County, originates to the northeast in the San Bernardino Mountains a little more than 75 miles inland and passes through portions of Riverside and San Bernardino Counties. It enters Orange County by way of a 12-mile gorge between the Puente Hills and the Santa Ana Mountains, known as the Santa Ana Narrows, and flows in a southwesterly direction across the coastal plain to the Pacific Ocean.

Precipitation in Orange County varies widely both according to season and according to geography and generally occurs in the form of rainfall. Mean seasonal rainfall near the center of the county at the City of Santa Ana for the 30-year period 1934-1964 was 13.04 inches, and precipitation ranged from a maximum of 34.34 inches during the 1940-41 season to a minimum of 3.56 inches during the 1960-61 season. At Camp Silverado in the Santa Ana Mountains mean seasonal rainfall is 24.37 inches. The maximum recorded rainfall at this station was 48.73 inches during the 1940-41 season, while the minimum recorded rainfall was 10.78 inches during the 1960-61 season.

Generally the temperature range is small. At the City of Santa Ana the mean temperature is 62° F. with recorded extremes of 22° F. and 112° F. Killing frost and temperatures exceeding 110° F. are of infrequent occurrence. Loss of semitropical crops is usually prevented during heavy frosts by use of orchard heaters or wind machines.

Hydrologic Subdivisions

The Orange County Study area is divided into three major hydrologic units: Los Angeles-San Gabriel River, Santa Ana River, and San Juan. Because each takes in considerable territory outside this study area, any

reference to a unit in this report will refer to only that portion of the unit within the study area. Information on the remainder of the Los Angeles-San Gabriel River Unit may be found in Department of Water Resources Bulletin No. 24-60, "Coastal Los Angeles County Land and Water Use Survey, 1960". Additional data on the Santa Ana River unit may be found in Bulletin No. 71-64, "Upper Santa Ana River Land and Water Use Survey, 1964". The San Juan unit is another unit that extends into another study area. Information on the remainder of this unit may be obtained from Department of Water Resources Bulletin No. 102, "San Diego County Land and Water Use Survey, 1958".

Each hydrologic unit has been subdivided into subunits and, in some instances, into subareas. Subunits were found to be the most suitable subdivision to describe. Three of these -- Anaheim, San Juan, and San Mateo -- extend beyond the study area; therefore, any values of land use extracted from this report pertaining to these three subunits will not be a subunit total.

The names and areas of the hydrologic units and subunits are presented in Table 1. The location and configuration of the boundary has been delineated on Plate 1.

Anahaim Subunit

This subunit, which is a subdivision of the Los Angeles-San Gabriel River Hydrologic Unit, extends beyond the study area into Los Angeles and San Bernardino Counties. The part of the subunit within the study area is located in the northwestern part of Orange County and covers 79,840 acres, or 125 square miles. The northern limits of this partial subunit correspond with the Los Angeles county line. The southern

TABLE 1

AREAS OF HYDROLOGIC UNITS AND SUBUNITS
IN THE STUDY AREA

In acres

Hydrologic subdivision	Area
Los Angeles-San Gabriel River Unit	
Anaheim Subunit	79,840*

San Mateo Subunit	11,600*
Subtotal	166,530
STUDY AREA TOTAL	528,090

*Subunits that extend into other study areas.

boundary is a drainage divide extending diagonally from Alamitos Bay northeast through Anaheim to another drainage divide in the Chino Hills.

Rolling hills form the northern part of this partial subunit. The hills level off to meet the coastal plain just north of Fullerton. The rest of this subunit is relatively level to the ocean. Elevations range from sea level on the coast to more than 1,700 feet near the county line. A number of canyons and gullies slice through the northern part of the partial subunit. Some form major thoroughfares where highways carry

large volumes of traffic. In particular, Brea and Carbon Canyons provide access to and from the Chino and Pomona areas, which are north of the study area.

Agriculture still exists in the more level parts, but urban development is rapidly encroaching on the once so plentiful farm land. Urban development is widespread and not restricted to any one metropolitan area. Rapidly growing cities such as Buena Park, Fullerton, and La Habra are located here, along with a large segment of Anaheim.

There are no perennial streams flowing through this partial subunit. All surface flow is to Coyote Creek, a tributary of the San Gabriel River, which passes through another portion of the hydrologic unit outside of the study area.

Lower Santa Ana River Subunit

The Lower Santa Ana River Hydrologic Subunit, which is a subdivision of the Santa Ana River Hydrologic Unit, covers all the central part of Orange County. It is rectangular in shape and oriented in a southwest-northeast direction. This important hydrologic subdivision of Orange County covers about 281,720 acres, or 440 square miles.

The wide, expansive coastal plain is the site of vast urban construction activity, spotted by intensively farmed agricultural land. East of the City of Santa Ana a considerable acreage of irrigated agriculture remains, including truck crops, oranges, and avocados.

The coastal plain extends inland about 15 miles where the land gently changes to rolling hills which rise to the steep slope of the Santa Ana Mountains. The inland limits of this subunit follow the drainage

divide of the Santa Ana Mountains which separates runoff between the Upper and Lower Santa Ana River Hydrologic Subunits. The southern or southeastern limit of this subunit extends toward the coast from Santiago Peak following the divide between the Lower Santa Ana River Subunit and the Laguna Subunit. This boundary closely parallels El Toro Road.

The Santa Ana River enters this subunit at Prado Dam and flows through the Santa Ana Narrows to the west side of the subunit. It then flows through the coastal plain in a southerly direction between the cities of Anaheim and Orange to the ocean just southeast of Huntington Beach. Santiago Creek, which is located in the northeast part of the subunit, flows into Irvine Lake. Below the lake, the creek continues on to meet the Santa Ana River just west of the City of Santa Ana.

The most populous cities in Orange County are located in this subunit. Anaheim, Santa Ana, and Garden Grove continue to be the hub of county activity. On the coast is Newport Bay, one of the most intensively used small craft harbors in Southern California. Military installations, such as the Marine Corps Air Station at El Toro and the U. S. Naval Weapons station at Seal Beach, are important to the economy of the study area.

Laguna Subunit

The Laguna Subunit is part of the San Juan Hydrologic Unit and is located in the southern part of Orange County, encompassing 40,940 acres, or about 64 square miles. The boundaries of the subunit follow drainage divides.

The topography is very rolling and steep, leveling off sharply on the coast to form steep palisades interspersed with scenic beaches.

Laguna Beach is the center of importance here, attracting throngs of tourists and vacationers from nearby metropolitan areas.

Agriculture is limited to the few level valleys in the upper reaches of Aliso Creek near the town of El Toro. Urban growth has occurred primarily along the coast between Dana Point and Laguna Beach.

San Juan Subunit

This subunit is also a subdivision of the San Juan Hydrologic unit. The subunit is bounded on the north by the rugged Santa Ana Mountains and on the west by the Laguna Subunit. The eastern side of the subunit borders on the San Clemente and San Mateo Subunits.

This hilly and mountainous area covers 101,310 acres, or 158 square miles. Major creeks in the area are San Juan, Canada Gobernadora, and Arroyo Trabuco.

Irrigated agriculture is restricted to the valleys and some rolling hills where avocados are successfully grown. Urban development is centered at San Juan Capistrano and Capistrano Beach.

San Clemente Subunit

This small subunit covers 12,680 acres which is almost 20 square miles. The subunit is also part of the San Juan Unit. It is situated east of Capistrano Beach and extends inland only about 6 miles. There are no major streams or creeks here.

Nearly all development, both urban and agricultural, remains confined to the coast. The coastal city of San Clemente attracts large crowds of tourists during the summer months.

San Mateo Subunit

The portion of this subunit in Orange County covers 11,600 acres, or about 18 square miles. It is a subdivision of the San Juan Unit. This partial subunit drains to San Mateo Creek which flows outside the study area. Most of the subunit falls within San Diego and Riverside Counties. There is very little urban development here and no irrigated agriculture. The subunit completes various land and water use values for Orange County.

Population

For many years Orange County has been one of the fastest growing areas in the nation. A feeling of this growth can be experienced when driving through the county. The aura of this dynamic growth is reflected in the gross changes of the landscape. New housing tracts are emerging everywhere. Roads are blocked for excavation, new sewers, water pipes, and gas lines. The road detour and construction signs are an indication of the progress being made in the county.

In 1940 the Bureau of Census estimated the population to be 130,760. By 1950 this value had increased to 216,224, an increase of 65 percent. Between 1950 and 1957, the year of the Department's last land and water use survey, the population had added 300,000 persons to reach a total of 516,000. This 139 percent increase of population in the county in seven years is continuing. Population figures in 1964 were estimated to be 1,070,800. This is an increase of 554,800, or 108 percent since 1957.

Table 2 lists the incorporated cities in Orange County with the census counts for 1940, 1950, 1960, and estimates by the Orange County Planning Commission for 1957 and 1964.

Urban Encroachment on
Citrus Groves near Anaheim

SPENCE AIR PHOTOS

Orange County is rapidly losing agricultural lands to urban and suburban development.

The increases in population between 1957 and 1964 varied from city to city, ranging from 6 percent in Dairyland to 1,078 percent in Fountain Valley. In 1957 approximately 82 percent of the county residents lived within an incorporated city. By 1964 this value amounted to slightly more than 90 percent.

The study area includes small portions of Los Angeles County and Riverside County. The population of these portions can be considered negligible when compared to the population of Orange County; therefore, the population values and results discussed in this section reflect only the figures for Orange County.

Urban and Suburban Development

The study area is rapidly losing agricultural lands to urban and suburban development. Housing tracts have replaced a large portion of the important agricultural development.

The total urban-suburban area, which had amounted to 69,490 acres in 1957, covered 140,590 acres in 1964. This area is made up of a number of different types of land use, many of which are dependent on the others for support.

For example, construction of a residential tract causes new schools to be built. The neighborhood shopping center emerges to serve the family needs. Light industry moves into the area to take advantage of the labor. This interdependency grows and accumulates at faster and faster rates, pushing and prodding at city boundaries and causing expansion in all directions.

TABLE 2

POPULATION OF INCORPORATED CITIES IN ORANGE COUNTY

a. Orange County Planning Commission estimate for July 1.
b. U. S. Census count of unincorporated communities, shown for comparative purposes.
c. Is now incorporated and called La Palma.

Single family residential units form about 85 percent of all existing dwelling units. Multiple units are rapidly replacing older single family residential development in the major cities. In 1964 there were 28,501 building permits authorized within the county. Of this total, 15,345 were for multiple units -- more than 53 percent.

Another phenomenon of competition for land area is the development of the condominium. This type of development resembles duplex or triplex residences set in a park-like atmosphere. Similar to this type of development is the retirement community. There are a number of these within the county -- some being cities in themselves, covering hundreds of acres.

SPENCE AIR PHOTOS

Industrial Complex near Buena Park

Light industry moves in to take advantage of the labor.

Industrial development has followed the fast pace set by the population influx. North American Aviation, Inc., with some 22,000 employees, is one of the largest of the approximately 1,400 manufacturing plants within the county. Other large industries are Hughes Aircraft Company, Beckman Instruments, Aeronutronic Division of Ford Motor Company, Douglas Aircraft Company, Nortronics, and Hunt Foods. Most of the manufacturing plants, however, would be classed as light industry.

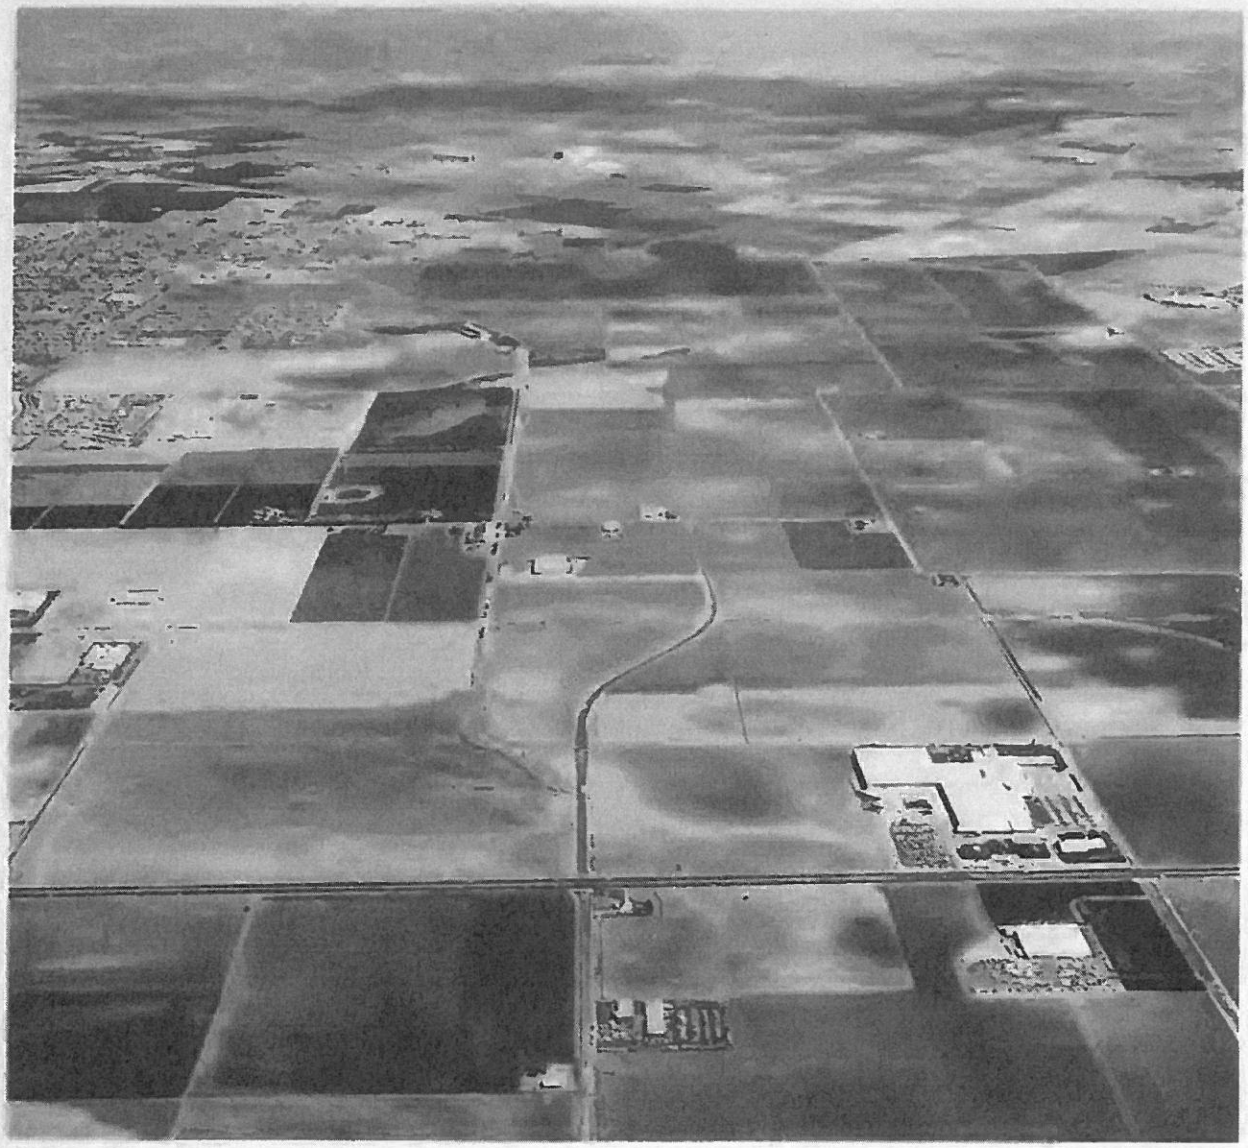
Total expenditures by military installations increased from a little more than $92 million in 1957 to slightly more than $133 million in 1964. The U. S. Marine Corps Air Station at El Toro contributes almost $96 million to this expenditure.

The assessed valuation of Orange County increased from $793,634,290 during the 1956-57 period to $1,820,385,734 during 1963-64. This 129 percent increase reflects the dynamic changes occurring in the county.

Agricultural Development

The first known agricultural development in the study area occurred in the vicinity of the mission San Juan Capistrano in 1776. Before 1900, the principal source of revenue was the raising of cattle pastured on native grasses and dry farm stubble. However, some irrigated agriculture, primarily truck crops and wine vineyards, did exist. Water for irrigation was obtained by diversions from the Santa Ana River and other streams, although shallow dug wells were developed during the latter part of the nineteenth century to provide firm supplies during the late summer and fall.

About the year 1900, the planting of orchards, primarily citrus, became common. The greatest influence on the expansion of agricultural



development was the introduction of the deep-well turbine pump. Use of ground water resulted in an increase of approximately 350 percent in agricultural acreage between 1904 and 1926. By 1948 there were 136,600 gross acres of irrigated agriculture in the study area. The principal crops were citrus, avocados, walnuts and other deciduous fruits, truck crops, and alfalfa. In 1957 the agricultural area was found to have decreased to 101,920 acres. The 1964 survey indicated even a greater decline in irrigated agriculture -- reaching 61,760 acres -- far below the 140,590 acres in urban and suburban development recorded in that same year.

The Orange County Department of Agriculture reported in the "Agricultural Crop Report, 1951" that, at peak development, citrus and avocado orchards covered as much as 84,000 acres. By 1957, only about 49,500 acres of orchards were productive, and by 1964 this figure had dropped to 26,730 acres.

Many of the citrus orchards that have been subdivided have been developed into estate-type ranches. Although much of the ranch is occupied by residences, there is still an appreciable area of bearing citrus trees that can be farmed on a commercial basis.

Citrus and avocados remain important to the economy of the county, but field crops have declined in value. There has been a shift to more intensive use of the land, growing and harvesting as many as three truck crops in a year on the same piece of land.

In recent years smog damage has been more prevalent. Nurseries appear to be the hardest hit, but almost all crops are affected to some degree. The smog problem will be a factor in deciding the type of agriculture that will exist in the future.

Agriculture in the Coastal Plain

SPENCE AIR PHOTOS

There has been a shift to more intensive use of the land, growing and harvesting as many as three truck crops in a year on the same piece of land.

The value of farm products in Orange County increased sharply from $34 million in 1940 to almost $94 million in 1945. The peak was reached in 1959 when production reached $114 million. The total gross value of Orange County agricultural products for 1964 was almost $98 million.

Water Supply

The two primary sources of water for the study area are ground water and imported water from the Colorado River through facilities of The Metropolitan Water District of Southern California. As previously mentioned, surface diversions from the Santa Ana River constituted the primary source of water supply for early irrigation enterprises. However, because of the erratic nature of this supply and the increased demands for irrigation and domestic water, this source became inadequate and wells were drilled to tap the underlying aquifers. As a result of the increased ground water development, large overdrafts developed in certain portions of Orange County.

The first published engineering evaluation of overdraft conditions was given in a report by the former Division of Water Resources, "Present Overdraft On, and Safe Yield from, the Ground Water of the Coastal Plain of Orange County", dated June 1, 1945. At that time the average annual overdraft on the coastal plain was estimated to be 12,000 acre-feet.

Overdraft conditions resulted in sea-water intrusion along the coast. In 1961 sea water had intruded some 3 to 4 miles inland, degrading approximately 6,700 acres. Saline waters have been moved seaward short distances in recent years as a result of pressures established by artificial recharge activities in the forebay area north of the City of Santa Ana.

In recognition of the inadequacy of local water supplies to meet the growing needs of the county, three cities -- Santa Ana, Fullerton and Anaheim -- became charter member agencies of The Metropolitan Water District of Southern California. Since the District's organization in 1928, two additional water service agencies, the Coastal Municipal Water District and the Orange County Municipal Water District have been formed and accepted into membership. The U. S. Marine Corps Air Station at El Toro also receives deliveries of Colorado River water from the Metropolitan Water District.

The Orange County Water District was created in 1933 and now encompasses most of the Coastal Plain of Orange County. The District overlaps the territory of previously mentioned water agencies and is responsible for spreading water for ground water recharge and for constructing salinity barriers along the coast.

Imported water was first delivered to Orange County in 1941 by the Metropolitan Water District through the Orange County feeder. This water, delivered through surface distribution facilities, has replaced water that otherwise would have been pumped. Beginning in 1949, imported water has also been used for recharge of the ground water basins by spreading in and adjacent to the streambed of the Santa Ana River. The net result of these operations has been a reduction in overdraft. During the 1956-57 season, 154,200 acre-feet of water was purchased by Orange County water agencies. This importation had increased in 1963-64 to 303,400 acre-feet. This represents an increase in deliveries of 97 percent.

Table 3 gives the historic seasonal deliveries of imported water. The boundaries of the major water agencies are shown on Plate 2.

*Includes 33,200 acre-feet of filtered, nonsoftened water.

Sewage and Industrial Waste Disposal

In the early stages of urbanizing Orange County, sewage and industrial waste were disposed of through privately owned cesspools and septic tanks. In free ground water areas, percolation from these cesspools and septic tanks constituted an important source of replenishment to the underlying ground water basins. With increased urban and industrial development it became necessary, for public health and convenience, to construct extensive sewerage systems and treatment facilities with ocean disposal.

The County Sanitation Districts of Orange County operate and maintain two marine outfall lines. In addition, smaller marine outfall lines are operated by other agencies. These smaller agencies are in Seal Beach, Laguna Beach, South Laguna, Dana Point, and San Clemente.

The only major water reclamation plan that has been attempted in Orange County was undertaken by the Talbert Water District. It pioneered in using primary effluent for irrigation, but discontinued this because of odor and other nuisance problems and also because of the encroachment of urban development on agricultural lands. The Irvine Company is proceeding with plans to reclaim waste water produced within the projected University City. The service area includes the new University of California at Irvine and the proposed city surrounding it. Orange County Water District, in collaboration with the U. S. Public Health Service, is conducting research in reclaiming and injecting effluent through wells to create an underground barrier for control of sea-water intrusion.

During the 1956-57 season a total of 38,900 acre-feet of treated effluent was discharged to the ocean. By 1963-64 this figure had increased to 103,100 acre-feet, or 165 percent over a period of seven years.

Presented in Table 4 is a tabulation of estimated quantities of sewage and industrial waste discharged to the ocean from sewerage systems within the study area.

CHAPTER III. LAND USE

The nature, location, and areal extent of land use within the Orange County study area were determined by a detailed survey conducted in 1964. For analysis and presentation, the various land uses were classified and grouped according to their water requirements. A detailed explanation of land use classification used in this report is presented in Appendix A. The classes of land use described are similar to those used in Bulletin No. 70 (the report on the 1957 survey). Irrigated fallow and idle lands were formerly placed in the nonirrigated agriculture category, but for this report, these lands have been considered part of the gross irrigated area.

Results of the Survey

Data from the 1964 land use survey are compiled in Table 5 by hydrologic units, subunits, and subareas. Land use by counties is shown in Table 6. Table 7 presents land use by selected major water agencies that serve the county. The subtotals in all the tables are in terms of net acreage (i.e., minus the streets, rights-of-way, and other nonwater-using sections within the particular land uses).

In 1964 the gross acreage requiring water service within the area of investigation was 202,350 acres. About 140,590 acres, or 69 percent of this area, was devoted to urban-suburban development. Gross irrigated agriculture totaled 61,760 acres accounting for the remaining 31 percent gross water service area.

Detailed information concerning the pattern of land use as determined from this survey is presented on Plate 3. Although the acreages of nonwater service areas within urban-suburban and irrigated

agricultural categories are shown individually in Table 5, they were not differentiated on the plate. Also omitted from the plate were developed nonwater service lands, such as nonirrigated agriculture, and undeveloped nonwater service lands, such as native vegetation. The boundaries of major water agencies are shown in detail on Plate 2. In Table 7, the eight agencies listed to the left of The Metropolitan Water District of Southern California are all members of it; their totals are given in the Metropolitan Water District column. About 397,000 acres, or 75 percent of the study area, lie within these eight major water service districts. These same districts include more than 99 percent (201,120 acres) of the gross water service area (202,350 acres).

Changes in Land Use

Changes in land use within the study area are indicated in Table 8 which lists land use data obtained during both the 1957 and 1964 surveys. The locations of these land use changes have been delineated on Plate 4. During the period between these surveys the gross urban and suburban area increased from 69,490 acres to 140,590 acres, an increase of 102 percent. Gross irrigated agricultural area was reduced by 40,160 acres, from 101,920 acres to 61,760 acres, a drop of 39 percent. The total gross water service area increased from 171,410 acres in 1957 to 202,350 acres in 1964, an 18 percent-increase.

Residential area increased from 27,960 acres in 1957 to 58,390 acres in 1964, a gain of 109 percent. Commercial lands gained by 244 percent, increasing from 3,640 acres in 1957 to 12,530 acres in 1964. The area in industry increased from 1,450 acres in 1957 to 2,850 acres in 1964,

amounting to an increase of about 96 percent. In the unsegregated urban and suburban category, which includes such land use types as dairies, farmsteads, livestock ranches, parks, cemeteries, and golf courses, land use increased from 6,090 acres in 1957 to 7,460 acres in 1964 -- a total increase of 22 percent.

A great deal of the residential growth between 1957 and 1964 occurred on what had been irrigated agricultural land; this accounted for most of the 39-percent loss in that category. New construction is also spreading to nonirrigated agricultural lands as well as raw brush lands. Valley lands are most vulnerable to development, although hilltops are being leveled by heavy equipment and are being developed.

The comparatively small percentage increase in development of the unsegregated urban and suburban area is caused by a shift rather than a loss of dairies and feedlots. The dairy industry has shifted from the older, established dairy-producing areas to more rural areas of the county. Because the dairy owner can no longer afford a large pasture area connected to his farm, he has reduced his operation to a milking shed, processing house, and holding pens. Instead of pasture to roam in, the dairy cows are now kept in what resembles a feedlot where they eat imported hay. This dairy feedlot operation may be expected to continue to develop in the more rural areas of the county where less expensive land can be obtained.

New golf courses are being constructed in many areas of the county. Their appearance is most noticeable adjacent to the large city-like developments such as the condominium and the retirement city.

TOTALS	**528,090**	**528,090**	

*Value Distributed Between Truck Crops and Nonirrigated Agriculture

As has been pointed out, a large part of the 39-percent decrease in agriculture can be attributed to urban development. Citrus and subtropical fruits suffered the greatest numerical loss, declining 45 percent, from 48,470 acres in 1957 to 26,730 acres in 1964. Field crops declined from 19,670 acres in 1957 to 3,500 acres in 1964. This 82-percent loss may actually be the result of the lower economic value of field crops and a shift to more intensive farming. Many acres of field crops formerly in

SPENCE AIR PHOTOS

Leisure World near El Toro

There are a number of retirement communities within the county – some being cities in themselves, covering hundreds of acres.

dry beans and other low income crops are now planted in truck crops. Pasture land declined about 67 percent, dropping from 4,070 acres to 1,340 acres. This too may be due to a lower economic value of the pasture land which has resulted in the changeover to a feedlot operation in the dairy industry. The only increase recorded in crop acreage within the county was experienced in truck crops, where the area increased from 20,330 acres to 21,480 acres. This amounts to a 6-percent increase since 1957.

PACIFIC AIR INDUSTRIES

College and Shopping Center Development in Santa Ana

From 1957 to 1964, commercial lands gained by 244 percent.

CHAPTER IV. WATER USE

To estimate the 1964 level of water use, the land use data reported in Chapter III were used with the unit values assigned to the various types of water use (as described in Appendix B). The results of this computation are presented in this chapter plus a comparison of these estimates with those from the 1957 survey. In addition, this indicated demand is compared with the estimated water supply.

Estimates of 1964 Net Water Use

The level of net water use in Orange County under 1964 conditions of development and under average precipitation and climatic conditions was estimated by applying mean seasonal unit values of consumptive use of applied water or, in some cases, total applied water to the net areas of each type of land use.

In water service areas overlying or tributary to free ground water basins, it was assumed that all applied water in excess of consumptive use requirements, except the portions of sewage and industrial waste exported from the area, returns to ground water storage and is available for reuse. The net water use for such an area was estimated to be the sum of the consumptive use of applied water plus sewage export. The inland or forebay area of Orange County was treated in this manner.

Recent studies by the Department have indicated that there is some deep percolation occurring in areas overlying confined ground water basins. The quantities and rates of recharge are not yet known. Therefore for this report, as in Bulletin No. 70, it has been assumed that deep percolation is limited and that net water use for these areas was considered to be equal to the total applied water. This method of calculating net water use was used in the coastal

part of the county because it overlies a pressure area where deep percolation is limited (pressure and forebay areas shown on Plate 1). Furthermore, some of the ground water basins underlying the coastal area are contaminated by oil brines or sea water. It is reasonable to assume that percolating water would be degraded in quality so that it could not be reused.

Details of the method used to estimate net water use are given in Appendix B, plus a brief discussion of unit water use. Unit values of water use for the study area are in Table 13 in Appendix B.

The estimated levels of mean seasonal net water use in Orange County, for 1964 conditions, are presented in Table 9. For comparison, values estimated for 1957 conditions are also given.

As indicated in the first part of this chapter, the unit values used to derive the net water use represent the needs of the various types of water-using developments under average conditions of precipitation and climate. The actual net water use for a specific year may have differed from the estimated values reported here because of deviations from the mean, but the estimates presented indicate the general level of water use.

Mean annual precipitation recorded at climatological stations in Anaheim, Newport Beach, and San Clemente over a 30-year period (1930-1961) were 13.76, 11.99, and 12.27 inches, respectively. During both water years 1956-57 and 1963-64, the average precipitation was 67 percent of the 30-year mean precipitation for these stations. Therefore, although the estimates of levels of net water use shown in Table 9 are probably on the low side as compared to actual water use, the difference between estimates for the two years shown is considered to be a good estimate of the change in water use during the period.

TABLE 9

ESTIMATED LEVELS OF NET WATER USE IN THE STUDY AREA
FOR CONDITIONS OF DEVELOPMENT IN 1957 AND 1964

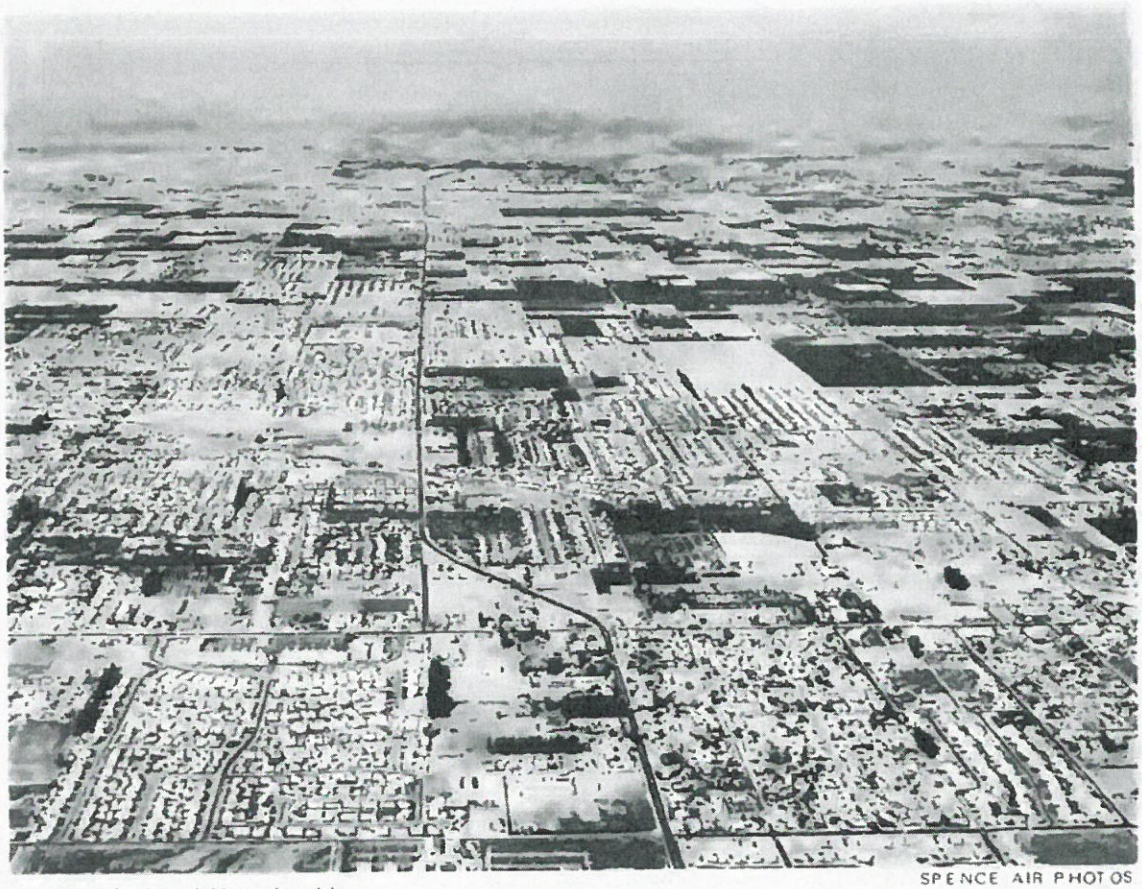
In acre-feet

Development	1957	1964	Change
Irrigated lands	139,900	84,900	- 55,000
Urban-suburban lands	104,100	220,500	+116,400
TOTAL	244,000	305,400	+ 61,400

Net water use data presented in this report reflect the changes in land use that were given in Chapter III. The estimated seasonal net water use for 1964 was 305,400 acre-feet -- this was an increase of 25 percent, or 61,400 acre-feet, above that of 1957. Urban-suburban water use increased by 116,400 acre-feet, almost 112 percent, while water use by irrigated agriculture decreased 55,000 acre-feet, or 39 percent.

TABLE 10

COMPARISON OF NET WATER USE AND
SUPPLEMENTAL REQUIREMENTS IN THE STUDY AREA



In acre-feet

Date of survey	Net water use	Safe yield* of local supplies	Supplemental water requirements	Historic imports**
1957	244,000	153,500	90,500	154,200
1964	305,400	153,500	151,900	303,400
1990	591,000	153,500	437,500	--
2020	804,000	153,500	650,500	--

*From Bulletin No. 78, Appendix D.
**From The Metropolitan Water District of Southern California.

Comparison with Water Supply

As was pointed out earlier, the water supply for the study area comes from local ground water and imports from the Colorado River. The approximate mean annual safe yield of the local supply as is shown in Table 10, has been estimated in earlier studies of the Department to be 153,500 acre-feet. Included in Table 10 is the forecast net water use for the years 1990 and 2020 as derived from current Department studies.

SPENCE AIR PHOTOS

Changes in Land Use, Looking North from near Garden Grove

For many years Orange County has been one of the fastest growing areas in the nation. (Same scene in two photos – above: 1956; on facing page: 1963.)

The export of sewage has been included in the net water use value in those areas overlying the forebay. Department records show that this was about 25,200 acre-feet in 1957. By 1964, it had reached 48,500 acre-feet. The imported water shown in Table 10 does not include that imported to the Los Angeles-San Gabriel Unit from adjacent ground water basins in Los Angeles County. These imports are small when compared to that imported through The Metropolitan Water District of Southern California.

SPENCE AIR PHOTOS

By the year 2020, the estimated total seasonal net water use for Orange County, as derived from current Department studies, will be on the order of 804,000 acre-feet. Of this, 650,500 acre-feet will have to be obtained by importing supplies. The expected increase in net water use between the present and the year 2020 will result largely from the development of land currently not receiving water service.

In the development of estimates of future requirements for water, particularly for urban areas, the value of the requirement can vary, depending upon the assumption made, particularly with respect to the disposition of sewage. The estimated requirement for the year 2020, presented above, was based on the assumption that additional facilities will be constructed to export sewage from the study area.

Experience has indicated that, as areas approach a high degree of urbanization, aesthetic conditions force the disposal of sewage to the ocean. It is recognized that the collection and central disposal of sewage is required in many areas to avoid public health problems and that the export of a certain amount of sewage, together with various industrial wastes, is necessary to maintain salt balance in ground water bodies. The derivation of the volume of such waste that is required to prevent adverse salt balance is beyond the scope of this investigation. However, the foregoing estimates of future net water use illustrate the extent to which the development of facilities for reclamation and local use of waste waters and for ocean disposal of sewage can affect water needs. It is, therefore, indicated that any such estimates may be subject to considerable modification, depending upon the ultimate sewerage system developed for the drainage area.

Regardless of the degree of development of facilities for ocean disposal of sewage in Orange County, estimates of net water use presented above indicate that a large increase in the volume of water imported to the area will be required to meet forecast demands.

To help meet this demand, The Metropolitan Water District of Southern California has contracted with the California Department of Water Resources to purchase over 2,000,000 acre-feet of water from the State Water Project. The State Water Project is expected to meet the area's supplemental water needs until 1990. Deliveries are to begin in 1971 and a portion of this water will be sold through the Metropolitan Water District to its member agencies in Orange County.

Demands for water after 1990 will require further implementation of the California Water Plan to convey additional supplemental water to Southern California, plus increased emphasis on the reclamation of waste water and sea-water desalination.

Appendix A

CLASSIFICATION OF LAND USE
AND
CONDUCT OF THE STUDY

Appendix A

CLASSIFICATION OF LAND USE AND CONDUCT OF THE STUDY

For analysis and presentation, the various land uses are grouped into two major categories under water service areas: (1) urban and suburban, and (2) irrigated agriculture; and into three major categories under nonwater service areas: (1) nonirrigated agriculture, (2) native vegetation, and (3) unclassified. Each of the two categories under water service areas includes several classes of land use. The classes include a number of types of land use -- all types within a class requiring similar unit amounts of water.

The major categories, classes, and types of land use in the classification are listed in Table 11.

In delineating land use types in the field, no attempt was made to exclude such items as streets, roads, railroad and powerline rights-of-way, and other essentially nonwater-using lands occurring within the surveyed areas. Later in the office, these land uses were extracted from overall land use totals by applying to each major land use class a percentage value appropriate for that class. The amounts extracted from gross land use totals were then classified as "included nonwater service area".

During this survey, a brief study was made to reevaluate the reduction factors for residential and commercial land use classes. The appropriate percentage reduction factors for the major classes of land use are presented in Table 12.

TABLE 11

MAJOR CATEGORIES, CLASSES, AND TYPES OF LAND USE FOR WATER SERVICE AND NONWATER SERVICE AREAS

Category and class of land use	Types of land use
WATER SERVICE AREA	
Urban and Suburban Category	
Residential	Single- and multiple-family houses and apartments, trailer parks, and residential subdivisions under construction at time of survey.
Commercial	All classes of commercial enterprises, including strip commercial and downtown commercial areas, schools, hospitals, churches, and motels.
Industrial	All classes of industrial land use involving manufacturing, processing, packaging, but excluding extractive (oil, sand, and gravel), storage, and distribution facilities.
Unsegregated urban and suburban	Dairies, farmsteads, livestock ranches, parks, cemeteries, and golf courses.
Included nonwater service	Oilfields, tank farms, vacant lots, quarries, gravel pits, warehouses, storage yards, railroad rights-of-way, public streets, landing strips of airfields, and miscellaneous paved areas.
Irrigated Agriculture Category	
Alfalfa	Alfalfa raised for hay, seed, or pasture.
Pasture	Irrigated grasses and legumes, other than alfalfa, used for livestock forage.
Citrus and subtropical	Oranges, lemons, grapefruit, avocados, olives, and miscellaneous subtropical fruits.
Truck crops	Vegetables of all varieties, melons, flower seed, and nursery crops.
Field crops	Sugar beets, corn, cotton, flax, and sorghums.
Deciduous fruits and nuts	All varieties of deciduous fruits and nuts.
Small grain	Barley, wheat, and oats.
Fallow	Land tilled between crops.
Included nonwater service	Public highways and roads, farm access roads, canals, and other inclusions not devoted to crop production, including irrigated idle and abandoned lands.
NONWATER SERVICE AREA	
Nonirrigated Agriculture Category	All varieties of dry-farmed crops, including pasture, nonirrigated fallow, and idle, that overlie defined ground water basins.
Native Vegetation Category	Native grasses, brush, and trees, including phreatophytes, that overlie defined ground water basins.
Unclassified Category	Bare ground, including river washes, beaches, and water surfaces, that overlie defined ground water basins; nonirrigated agriculture and native vegetation not overlying defined ground water basins.

TABLE 12

FACTORS FOR REDUCTION OF
GROSS AREAS TO NET AREAS

Land use	Percent deducted from gross area
Residential	22
Residential (low density)	10
Commercial	20
Schools	15
Industrial, manufacturing	25
Parks, cemeteries, and golf courses	15
Farmsteads, livestock ranches, and dairies	10
Irrigated agriculture	5

The net acreage values used in the tables summarizing land use represent the gross acreage values minus those portions of the gross values that have been deducted for these included nonwater-service areas.

Mapping of land use in Orange County was carried out by field crews who delineated the various land use types on recent aerial photographs. In the office, these field delineations were projected onto reproducible prints of U. S. Geological Survey quadrangle maps at a scale of 1:24,000. These maps served as area control maps insuring the accuracy of the succeeding process, while the reproducible prints served as masters for reproducing land use delineations on vellum prints. The individual areas of land use types were cut from the vellum prints and weighed, and these weights were converted into total acreages of individual land use types. These various land use types were grouped according to their

water requirements. Then, appropriate unit values of water use were employed to estimate net water use.

Land use data collected by the Department of Water Resources are processed by machine techniques, which permit the evaluation of this data in terms of a sizable number of hydrologic, geographic, or political subdivisions. The tabulations in the main body of this report give land use within the boundaries that are thought to be the most generally useful.

For a critical hydrologic analysis, determining and compiling the types of land use -- both developed and undeveloped -- for the entire area of the hydrologic unit would be desirable. This would permit a comprehensive analysis and evaluation of the various levels of water use for the entire area. However, the additional expense incurred in making such a complete compilation is not felt to be warranted at present; therefore, only those areas that are underlain by water-bearing material are mapped in their entirety. In those areas that are not underlain by water-bearing material, only types of land use requiring applied water are mapped. All other types of land use in areas not underlain by water-bearing material are tabulated in a category called "unclassified".

Appendix B

UNIT VALUE METHOD FOR ESTIMATING NET WATER USE

Appendix B

UNIT VALUE METHOD FOR ESTIMATING NET WATER USE

Where none of the applied water is available for reuse, the net water use is determined by measuring the total applied water. On the other hand, in areas where a portion of the applied water becomes available for reuse, it is not possible to measure the volume of return flow of reusable water. The net water use in these areas must be determined in another manner; therefore, an indirect method is used.

In the indirect method employed in this investigation, estimates of net water use are obtained by multiplying the areas of the various classes of water-using developments by appropriate average values of consumptive use of applied water. These unit values of consumptive use reflect average conditions of precipitation and the normal practices associated with urban water distribution and with irrigated agriculture.

When using this method for determining net water use, the unit values of consumptive use of water must be clearly correlated with the appropriate land use classes or types (see Appendix A). This is especially critical for residential, industrial, and commercial water uses.

During this investigation, urban and suburban unit values of consumptive use of applied water derived in State Water Resources Board's Bulletin No. 2 and Department of Water Resources' Bulletin No. 70 were reviewed and were found to be the best available. A complete discussion of the techniques employed in the derivation of units of water use is contained in Bulletin No. 2; therefore, only a general description of those procedures is given here.

TABLE 13

ESTIMATED MEAN SEASONAL UNIT VALUES OF DELIVERY AND CONSUMPTIVE USE OF APPLIED WATER ON URBAN-SUBURBAN AND IRRIGATED LANDS IN THE ORANGE COUNTY AREA

*Consumptive use of applied water.

Mean seasonal unit values of consumptive use of applied water on urban and suburban lands were estimated for Bulletin No. 2 on the

basis of a sampling procedure in which an inventory was made of measured water deliveries to study areas representative of each class or type of land use. For residential and commercial areas, study areas consisting of single blocks devoted entirely to one type of land use were selected. To compute the unit values of water use, an allowance for the applied water that is disposed of as sewage and is returned to the ground water body was deducted, and the remainder was divided by the net sampled area. Unit seasonal values of consumptive use of applied water by irrigated crops were derived by a method developed for the U. S. Department of Agriculture by Harry F. Blaney and Wayne D. Criddle.

The mean seasonal unit values of consumptive use and delivery of water so determined, shown in Table 13, along with sewage export, were utilized to compute net water use in all forebay areas where excesses of consumptive use are available for reuse through deep percolation.

In the coastal pressure areas of the county, net water use was estimated by applying unit values of delivery to the net areas of land use. The applied water or delivery figure is used in any area where deep percolation is restricted and recharge of the ground water basin is assumed to be negligible.

It should be pointed out that, in the derivation of the net water use for any given year, the volume of applied water required is based on the assumption that the precipitation for the season was equal to the long-time mean. However, the use of applied water will actually be somewhat larger or smaller in individual years, varying inversely with the amount of rainfall. A similar effect occurs with urban use; however, the use of precipitation by residential, commercial, and industrial

classifications is relatively small. Therefore, variations of rainfall from year to year have a lesser effect upon the use of applied water by these land use classes than by irrigated lands. Despite the possibility of these variations, the procedures used in this survey are considered by the Department to be the best available, resulting in reasonable values of current levels of water use.

Appendix C

DEFINITION OF TERMS

Appendix C

DEFINITION OF TERMS

Annual - The 12-month period from January 1 of a given year through December 31 of the same year, also called the "calendar year".

Applied Water - Water delivered to a farmer's headgate, in the case of irrigation use, or to an individual's meter (or its equivalent), in the case of urban use. Applied water does not include direct precipitation. Man applies water to satisfy the requirement for consumptive use in excess of the amount supplied from natural sources. However, as a practical matter, the quantity of water applied is usually in excess of the consumptive use of applied water and that portion of the water applied to any use that is not consumed or irrecoverably lost remains a part of the water supply.

Average - An arithmetical average relating to a period other than a mean period.

The California Water Plan - A master plan to guide and coordinate the planning and construction by all agencies of works required for the control, protection, conservation, and distribution of California's water resources for the benefit of all areas of the State and for all beneficial purposes.

Confined Ground Water - A body of ground water that is immediately overlain by material sufficiently impervious to sever free hydraulic connection with overlying water and that is acted upon by pressure caused by the difference in head between the intake, or forebay area, and the discharge area of the confined water body.

Consumptive Use of Water - Water from any source consumed by vegetative growth in transpiration and building plant tissue, also water evaporated from adjacent soil, from water surface, and from foliage. It also refers to water similarly consumed or evaporated by urban and nonvegetative types of land use.

Forebay Area - An area that consists of unconfined ground water where hydraulic continuity with the ground surface generally exists and that is located so as to provide a supply of ground water by subsurface flow to a body of confined ground water.

Free Ground Water - A body of ground water not immediately overlain by impervious materials.

Gross Area - An area of land use, as mapped in the field, which includes the acreage of streets, roads, railroad and powerline rights-of-way, and other essentially nonwater-using lands.

Ground Water Overdraft - The annual net extraction of water from a ground water basin in excess of safe yield.

Hydrologic Unit* - In this bulletin, a classification embracing one of the following two topographic characteristics, both of which are defined by surface drainage divides:

a. In general, the total watershed area, including water-bearing and nonwater-bearing formations, such as the total drainage to the Santa Ana River.

*The areal designation system, i.e., categorizing areas into units, subunits and subareas, is designed to separate data according to areas of hydrologic significance. The system, as developed, does not differentiate between water-bearing formations and nonwater-bearing tributary areas, although land use, as inventoried, does differentiate between such boundaries.

b. In coastal areas, two or more small contiguous watersheds having similar hydrologic characteristics and water supply problems, each watershed being directly tributary to the ocean and all watersheds emanating from one mountain body located immediately adjacent to the ocean.

Hydrologic Subunit* - In this bulletin, a major logical subdivision of a hydrologic unit, including water-bearing and nonwater-bearing formations, best typified by a major tributary of a stream, a major valley, or a plain along a stream containing one or more ground water basins and having closely related geologic, hydrologic, and topographic characteristics.

Hydrologic Subarea* - In this bulletin, a logical subdivision of a hydrologic subunit which may include either water-bearing or nonwater-bearing formations or both. Where possible, a hydrologic subarea includes one known ground water basin and its tributary area; the ground water basin comprising the water-bearing deposits of the subarea. In areas which are essentially nonwater bearing, the subarea division was based only on surface drainage conditions, and such factors as locations of gaging stations were given due consideration.

Irrecoverable Losses - Such items as disposal or seepage of unconsumed water to bodies of unsuitable quality, including the ocean, and disposal or seepage of unconsumed water in such a manner as to be uneconomical to recapture for use. These irrecoverable losses are incidental to consumptive use of water.

*See Footnote on preceding page.

Irrigation Efficiency - The ratio of consumptive use of applied irrigation water to the total amount of water applied, expressed as a percentage.

Mean - An arithmetical average relating to a mean period.

Mean Period - A period chosen to represent conditions of water supply and climate over a long series of years. For the current investigation, the mean precipitation period embraces the 50 seasons from 1897-98 through 1946-47.

Net Area - An area of land use less the area in streets, road, railroad and powerline rights-of-way, and other essentially nonwater-using lands.

Net Water Use - That portion of applied water which is consumptively utilized for beneficial purposes or otherwise irrecoverably lost. It does not include that portion of the applied water which is subject to possible reuse.

Overdraft - The annual net extraction of water from a ground water basin in excess of safe ground water yield.

Pressure Area - A ground surface area underlain by an aquifer containing confined ground water.

Primary Effluent - Waste water that has gone through the primary treatment process. Primary treatment removes a portion of the settable, suspended, and floating matter from domestic or industrial waste by screening, skimming, sedimentation, or other physical means.

Safe Yield - The average annual net amount of water that could be beneficially extracted from a ground water basin over an indefinitely

long period of years under a particular set of physical conditions affecting supply to and disposal from the ground water basin, without causing a net lowering of ground water levels during the period.

Seasonal - Any 12-month period other than the calendar year.

Water Use - In the broadest sense, includes all uses of water by nature or by man, whether consumptive or nonconsumptive, as well as irrecoverable losses of water incidental to such employment. It is synonymous with "water utilization".

AND OTHER REFERENCES

Appendix D

REPORTS ON RELATED INVESTIGATIONS AND OTHER REFERENCES

There are three very important reports which are related to this bulletin:

California State Water Resources Board, "Water Utilization and Requirements of California", Bulletin No. 2, June 1955. This bulletin was written in preparation of The California Water Plan and contains information on land and water use for the entire State. The land use data is based on a survey made in 1948.

California Department of Water Resources, "Santa Ana River Investigation", Bulletin No. 15, February 1959. Hydrology of the entire Santa Ana River drainage area was the subject of this report. It contains an inventory of surface and underground water resources along with estimates of ultimate water utilization and requirements. Like Bulletin No. 2, this report is based on the 1948 land use survey.

California Department of Water Resources, "Orange County Land and Water Use Survey, 1957", Bulletin No. 70, January 1959. This report sets the pattern which Bulletin No. 70-64 follows. Land and water use data are based on a 1957 survey. The results of the 1957 bulletin have been used extensively in the present report for comparison.

Hi Hector,

Good morning. The developer does not plan to make these gated communities at this point. However, they will be submitting a plan with two small parks, one in the affordable housing and one in the market rate housing, and children's play equipment will be in each. Is that what you are asking about?

As always, if you have any questions, please email or call me,

Hello Tom, it is my understanding the low income housing does not have open space/park The regular homes being built is a gated community and the low income housing will not have access to the parks.

One of the representatives explained this to me I wanted to confirm with you.

Hi Tim,

The big question is the environmental impact of increased traffic as you might have been asked already. With the 405 expansion and tolls, new development, Lampson Ave will be impacted.

Reviewing the plans I don't understand how the parking adds up to accommodate. Looks like we will have a Montecito St in Seal Beach near Rossmor situation where the condos take over the residential streets. I believe those units have 2 car garages and the overflow is difficult.

Good morning Tom,

Our primary concern in our household is the need for trees in our community. On the housing plan it looks like all the trees are being ripped out. There is a lot of history with those trees in our community. They are important to the environment in our community. It seems like the open space on the project is very limited. And the neighbors will becom dependent on the park resources provided by Seal Beach. The environmental impact of destroying those trees is a cause for concern.

The amount of vehicles at that location will create automobile pollution. Lampson Avenue will turn into Lampson Highway.

Is it possible to only have one entryway where the primary apartment entryway is?

This way there's no disruption for the residence off of Rose and Lampson?

This developer has a lot of experience and I don't see why they can't design to keep the trees.

Thank you for your attention.

Mr. Tom Oliver,

This project is terrible for many reasons. This project is going to leave 1400+ kids between fall and spring seasons with nowhere to play soccer. These kids will not be able to play anywhere else because there is so little park area to even use. All of the schools control their grass area and control the rental cost (which is ridiculously expensive) , the times it can be used and the access. Nowhere for these kids to go to learn the AYSO Six philosophies including:

Everyone Plays
• Balanced Teams • Open Registration • Positive Coaching • Good Sportsmanship • Player Development

These kids will be losing the opportunity to learn leadership skills, discipline, team work, listening skills, and more. I have been a coach for my kids at this field for several seasons, referee, and a part of the board for a year. The top things I hear from the parents in my years is this is a safe place for kids to learn a new skill. This is a great place for my child who is shy or an introvert and is really flourishing. Or my child really needs this outside time and exercise and discipline. It is good for them. Another ridiculous residential project is going to wipe all that away for many kids. You can't tell me that the revenue or more rental / leasing income is more important than these kids sports. This will be just another amount of units taking over premium land for kids to enjoy.

I have been in the construction industry for a long time and I see how all of this land gets taken away from more important things, like kids playing and having fun but no developers create a new park out of it. It is not like if you cut down a tree you have to plant a tree. These developers just take and take and take and never give back.

AYSO Region 159 environmental concerns regarding the proposed 246 Residential Unit Project for 4665 Lampson Ave a.k.a. West Ed Property

1. Arbor Park has approximately 100 parking spots, with 30 of those parking spaces located on the south side of the dog park. Region 159 has always strived to provide adequate parking for the dog park, which leaves roughly 70 parking spaces available on Saturdays. Therefore, Region 159 families and volunteers utilizing Arbor Park on Saturdays routinely park in the 4665 Lampson Avenue parking lot. That parking lot provides over 300 parking spaces that are essential to our use of Arbor Park and ensure soccer families are not parking in the nearby neighborhood of College Park East (CPE). The proposed project at 4665 Lampson Avenue states it will provide 557 parking spaces that will be entering and leaving the property from Lampson Avenue between traffic lights at Heather Street and Rose Street. The lack of signal control currently planned for traffic in and out of the development will adversely impact traffic safety on Lampson. It is already a dangerous street with a history of serious accidents. The number of planned parking spaces is insufficient for the number of planned residences. Garage spaces will be used as storage, or other purposes other than parking. Many of the homes will have more than two or three cars and drivers. These homes will have guests that will need parking as well. Region 159 is concerned Arbor Park or CPE residential streets will then become overflow for the planned development. 17-10

2. CPE has less park acreage than other neighborhoods in Seal Beach, Los Alamitos or Rossmoor. Arbor Park has helped fill that void by providing a large grass area to support organized and unorganized sports including soccer and baseball. The proposed new development details do not show any park space, such as a playground for residents. Region 159 requests the EIR include a listing of existing parks within a ½ mile of the planned development. In addition, we request the EIR include an evaluation if the planned development should include park space, such as a playground, basketball court, etc. for the residents of the planned development, to not further impact already limited nearby park facilities. 17-11

3. Arbor Park is currently home to many recreational activities, some of which begin in the early hours of the morning, plus a portion of Arbor Park is used for a very popular dog park. Region 159 requests that the EIR include an evaluation of noise at Arbor Park during busy weekends when the park is filled with soccer matches and the dog park is being utilized. To avoid future complaints from the new residents of the planned development about noise from soccer Saturdays and the dog park, noise impacts should be studied and if necessary, mitigation measures proposed. The noise study should be conducted to include all hours of the day on Saturdays when whistles, loud voices, cheering and other noises are made. 17-12

I am a resident of this community. I grew up in Seal Beach in College Park East. I lived there for 4 years as a parent and am still in the area for community events.

My children do soccer at Arbor Park every weekend. My children play at Heather Park near your proposed project site.

I am very concerned about your proposed project will negatively affect our neighborhood. This is our community and I don't want to ruin our community and keep it true to our roots.

Please strongly consider my concerns for our community. I strongly oppose this project.

Dear Mr Oliver

Thank you for the opportunity to respond on the project on Lampson. I live at 4689 Hazelnut Ave Seal Beach. I have lived in Seal Beach for 31 years. College Park East has been a great place to live and raise my two children. The property at 4665 Lampson has been fantastic open space to walk my dogs and teach my kids to ride their bikes in open space. I am not opposed to changing from commercial to residential. I know we need the housing in Southern Ca. Please consider the density and space of this project. You must have two parking spots per unit of housing. Condo, Townhouse or SFR. You know each unit will have two adults to pay the rent or mortgage and they both drive a car. There is NO parking on Lampson. Over flow parking will go into College Park East. I live two block off Lampson. College park will be the only place the over flow can park. Please consider more open space for the complex. You need space for kids to play and walk your dogs. The maps shows one small park 14,000 sq ft., residence will all come into College Park and use Heather park and have their dogs crapping on our property. Please consider these two items before you approve this project. This will affect my quality of life and I hope you consider these changes.

Hi Tom,

As a member of the CEP community, we are strongly against a large building project on Lampson.

- The road is already very busy and poorly planned. We live on Birchwood and our street is unsafe as is with people using it as a bypass.
- Our streets are barely able to accommodate the excess of cars from the people who currently live here - people have more cars than can fit on their driveways or in garages. Having more cars parked for a large-capacity building (owners and visitors) will be unbearable.
- Our parks are some of the worst in the area and we are already limited on green space. Having a project that does not include its own resources is unacceptable.

17-15

Plese reconsider this project.

Thank you,

Michelle Stohler

From: Ryan Winkleman
To: Tom Oliver
Subject: 4665 Lampson Avenue DEIR NOP
Date: Tuesday, November 1, 2022 7:32:34 AM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender rswinkleman@gmail.com

Hello Mr. Oliver,

My name is Ryan Winkleman. I am a wildlife biologist and biological consultant and have been practicing in southern California for 17 years. I am the lead data reviewer in Orange County for the Cornell Lab of Ornithology's eBird website, a global database of bird location records supported by citizen science and the birding community, and I am Orange County's quarterly report compiler for the American Birding Association's quarterly scientific publication *North American Birds* (NAB), which has examined the status and distribution of birds on a local and national scale for decades.

I am writing about the 4665 Lampson Avenue project in the City of Los Alamitos. I see on the City's Notice of Preparation (NOP) website that a Draft Environmental Impact Report (DEIR) is planned for this project, but Biological Resources are missing from the list of resources to be addressed in it. I am writing to you to let you know that I believe Biological Resources should be a focus of the DEIR due to the project's adjacency to both the Joint Forces Training Base (JFTB) and Arbor Park. Based on the Exhibit 2 *Site Plan* on the website, the project will raze the existing parking lot and office building inhabited by the California Department of Fish and Wildlife (CDFW) and replace them, and the entire rest of the parcel, with residences where none currently exist.

17-17

However, several species of protected birds are known to utilize the immediate surrounding area that could be impacted both by construction and by the increase in disturbance that would result from the new residences. These include species that are obligated under the California Environmental Quality Act (CEQA) to be given a significant impacts analysis because they have been designated as a CDFW Species of Special Concern (SSC) or higher. This obligation is in the first Biological Resources question in Appendix G of the CEQA Guidelines, which asks whether the project would "Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?"

The species that I believe require a significant impacts analysis in the City's DEIR include the following:

- Swainson's Hawk. This species is designated as threatened under the **California Endangered Species Act**. Between 2018 and 2022 Swainson's Hawks have visited this area annually, with successful nesting confirmed in 2019 (two chicks fledged) and 2021 (three chicks fledged) and nesting strongly suspected to have occurred but failed based on behavior in 2018 and 2020. Each year the birds have summered on the far eastern edge of the Old Ranch Country Club other than 2019 when they nested on Naval Weapons Station Seal Beach. At the time of the discovery of the 2019 nest, this was the first confirmed nesting attempt in Orange County in 131 years. I actually monitored these birds for several years due to my

17-18

association as the lead biologist at the time on the I-405 Improvement Project, and worked closely with the designated CDFW biologist on the project, Ms. Simona Altman. I also have a network of local birders in the Los Alamitos/Seal Beach/Long Beach area who help keep tabs on the birds for me for my own reporting purposes in the quarterly NAB reports. They are a very well-known occurrence in this area both in the birding community and among wildlife agencies.
- White-tailed Kite. This species is designated as fully protected by CDFW and the California Fish and Game Code. That means it cannot be taken or harmed in any way other than for valid scientific research. There is a population of kites that nests nearby and uses the JFTB as foraging habitat. This is a well-documented use area by this species, with over 300 individual reports of one or more birds observed in the area since 2018 in the eBird database.
- Northern Harrier. This species is designated as a SSC by CDFW. Although it has no legal conservation status, SSC are required under the CEQA to be analyzed for significant impacts. Harriers are also known to frequent this area, with nearly 250 individual reports of one or more birds observed in the area since 2018 in the eBird database.
- Vermilion Flycatcher. This species is also designated as a SSC by CDFW. Vermilion Flycatchers have a robust breeding population at Arbor Park and are documented year-round in typically high numbers by local birders. This species has nearly 450 individual records of one or more birds observed in the area since 2018 in the eBird database.

17-18 (CONT.)

I believe that these four species, *at a minimum*, require a significant impacts analysis in the DEIR under the CEQA due to their overwhelmingly well-documented presence in the area by the birding community and biologists. Whomever is hired to write the DEIR should perform a thorough and exhaustive literature review of which sensitive species are known to occur in this area and should analyze all of them for significant impacts if they have a conservation status of SSC or higher. This may include other species that I have not mentioned here including Peregrine Falcon, Horned Lark, or others, including non-avian species. Construction and operation of the project may have adverse impacts on breeding and/or foraging behavior by the four aforementioned bird species and possibly others as well as possibly a loss of foraging habitat as a result of the development. The project should investigate rigorous nesting bird protection measures as well as possibly compensatory mitigation for direct and indirect loss of foraging habitat both on- and offsite as a result of the development and increased human disturbance.

This is one of the last remaining places in Orange County where these birds have large spaces of open habitat to support them, particularly for Swainson's Hawks, which had not nested in Orange County since 1888 prior to the discovery of the 2019 nest. I implore the City of Los Alamitos to conduct a thorough analysis of Biological Resources in its DEIR for the 4665 Lampson Avenue Project.

17-19

Sincerely,
Ryan Winkleman

Dear Mr. Oliver,

As a 48 year resident of CPE and one of thousands of families that use the Arbor Park facilities on a weekly basis, I ask you to reconsider the current plan of developing a high density residential development at 4665
Lampson Avenue. This property provides the community the ability to use the limited green space our residents have access to. Your proposed plans would have a dire affect on the value of the surrounding neighborhoods and signficantly increase traffic and parking
along Lampson. The lack of signal control currently planned for traffic in and out of the development will adversely impact traffic safety on Lampson. It is already a dangerous street with a history
of serious accidents including the death of a very close friend. The number of planned parking spaces is insufficient for the number of planned
residences. Garage spaces will be used as storage, or other purposes other than parking. Many of the homes will have more than two or three cars and drivers. These homes will have guests that will need parking as well.

17-20

Your proposal to include low-income housing on this property is also very concerning considering the exorbitant amount of of property tax current residents in the surrounding
area currently pay. This is simply not beneficial to anyone in the surrounding neighborhoods. I would hope that the City of Los Alamitos would be more conscientious of its neighboring cities and create a plan that is more inclusive and beneficial for the residents
in the area.

17-21

Sincerely,
Diana Mejia-Jones

Dear Mr. Oliver,

The parking lot servicing the office building at
4665 Lampson Avenue
acts as overflow parking for Arbor Park. As you may know, the park is one of the main play fields for Region 159 AYSO soccer. It hosts both games and practices for many young people throughout the week, including my two daughters.

Arbor, and the adjacent dog park do not have enough parking space for the number of vehicles they attract on the weekends. If the parking lot at 4665 Lampson Avenue is developed into residential/commercial space many AYSO participants, and pet owners will be forced to park in the neighborhood directly south of the park. I believe that may cause friction between park users and home owners as it will reduce street parking in the neighborhood. The increase in park goers crossing Lampson at the Heather St crosswalk will also slow through traffic on Lampson, and creates a greater risk of children/parents getting hit by a car. I ask that the city's Draft Environmental Impact Report look at what options are available to keep Arbor's overflow parking on the north side of Lampson.

17-22

Very Respectfully,

Joseph Nieblas

Re: 4665 Lampson Avenue Project

Dear Mr. Oliver:

The 4655 Lampson Avenue Project (the "Project") as proposed will not only have a devastating impact on the value of our College Park East, Seal Beach, home just two doors from Lampson (which we have owned since 1988), but also on the quality of our daily lives and of our neighborhood. My major objections to this high density residential project for hundreds of residents in the place of a modest two-story government office building are as follows:

Inadequate Project Parking Will Result in Project Residents
Using Seal Beach Homeowners' Parking Spaces

The vastly inadequate parking spaces proposed in comparison with the number of vehicles likely to be owned by the hundreds of Project residents will necessarily result in residents parking in front of our house and the houses of our neighbors here on Rose Street in particular, and elsewhere in our neighborhood. We are a four-car family, and already need all of the available spaces for our own use and that of our visitors. Most of our neighbors are in similar circumstances.

17-29

Increased Traffic and Traffic Hazards

The Project as proposed will also bring significantly increased traffic and traffic hazards to the already busy Lampson corridor. College Park East residents have no alternatives to Lampson for entry into our neighborhood. As it is, cars frequently exceed the speed limit on the Lampson straightaway, and traffic records will confirm the many accidents and fatalities on this route. In addition to the significant traffic that will be added by hundreds of additional Project residents coming and going at all hours of the day and night, the Project design will require its residents to make a dangerous U-turn when heading towards Valley View. When exiting the Project site, they will first need to turn right unto Lampson, and to then make a U-turn at Heather, as the median strip

17-30

prevents a direct left turn from the site.

17-30 (CONT.)

Inadequate Public Facilities Will Cause Project Residents To Use Seal Beach's, Which are Paid For and For the Use of Seal Beach Residents

College Park East's three parks, including their kids' playgrounds and tennis and basketball courts, are maintained by the taxes paid to the city of Seal Beach by its residents for the use of its residents. The absence of any similar public spaces and facilities in or even near the Project in the city of Los Alamitos, and the fact that Seal Beach's facilities are just across the street from the Project, insure that the hundreds of Project residents will want to make use of the Seal Beach facilities at Seal Beach's expense.

17-31

Strain On School System

Although College Park East has no elementary school itself, the hundreds of new Project residents will put a strain on the already crowded Los Alamitos Unified School District system.

17-32

Installation of New Utility Infrastructure Needed by Project Will Cause Major Disruptions

The change in the use of the land from a state office building to housing for hundreds of residents will necessitate major utility infrastructure changes. The construction work needed for these changes will cause of major disruptions to Lampson Avenue and College Park East residents for many months.

17-33

Environmental Concerns

The Project's hundreds of new residents will put a strain on water delivery in a region already suffering from drought conditions. The pollution resulting from hundreds of new residents and their vehicles and other polluting appliances and devices, squeezed into 12.3 acres, will affect the existing residents across the street in College Park East.

I urge you to use your office to strongly oppose the 4655 Lampson Avenue Project and to prevent this high density residential use of the property or any other use so wildly divergent from its former use as a modest office building.

17-34

DEVELOPMENT PROJECT 4665 LAMPSON AVENUE

Hello my name is Reid Kupfer. I am a homeowner and resident in College Park East and I strongly oppose your development at 4665 Lampson Ave.

I believe your project will have a negative impact on our environment and on the quality of life for the residents living in College Park East/Seal Beach, West Garden Grove and Los Alamitos. This is a very unique situation where four cities are within a quarter mile of each other and share one road(Lampson Avenue) with only one way in and one way out.

Your development will bring hundreds of more vehicles onto Lampson Avenue causing congestion and creating more pollution. This will have a major impact on our wildlife and residences living nearby. Having no traffic light at your development will force hundreds of your Vehicles to go west on Lampson Avenue or cut through the neighborhoods of College Park East causing a backup of traffic, potential car accidents and safety issues for pedestrians and children.

17-35

I understand that purchasing this property was a win-win for the City of Los Alamitos and for the housing developers, however it will come at a cost to the residents of College Park East/Seal Beach and West Garden Grove. Since your development has no playgrounds, no markets, no walking paths, no tennis courts, and no pools, your residence will be coming into the nearest cities (College Park East/Seal Beach & West Garden Grove) for all their needs and recreation. This will cause overcrowding, excessive noise, pollution, traffic congestion, parking issues, and wear and tear to our facilities/equipment. Is there a plan to stop these issues before they become major problems to our environment and communities?

17-36

I Believe a compromise of adding a traffic light, reducing your apartments down to two stories, and adding a playground would help to reduce some of the problems/environmental impact that your development will bring to our communities. Please consider how the added noise, bright lights, traffic, pollution, and overcrowding will affect the environment and residence of College Park East/Seal Beach and West Garden Grove before you continue with the current plans for your housing development project.

Thank you

Reid Kupfer

Subject: 4665 Lampson Project - Concerns for Environmental Impact Report
Date: Wednesday, November 2, 2022 11:54:15 AM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender rhlabounty@yahoo.com

Mr. Oliver -

Thank you for taking the time to sift through what I am assuming is a number of concerns that have been proposed in regards to this project. I'd like to make sure the environmental impact study does address a few points: 17-38

1) Arbor park has been the location for youth AYSO soccer for nearly 40 years. The new project would remove the use of the current parking lot for this park. My concern is that this will push all participants into the College Park East neighborhood to park and force them to cross Lampson with small children and wagons full of equipment. With nearly 1000 participants in the fall, having that many children crossing the street all day will create a safety concern as cars already speed down that street. A safety study must be done to make sure that these kids are safe crossing the street, especially since the light at Heather St comes just after a blind curve. In addition, parking must be fully addressed in this plan as it would be unfair for residents of this new project to use Arbor park's limited 100 spaces as their own. 17-39

2) I would also like to make sure that noise is addressed in the report, specifically relating to soccer on Saturdays and the use of the dog park on all mornings and evenings. Residents of these new units will need to deal with the noise of soccer games, cheering and whistles, starting at 8am on Saturdays. In addition, they would deal with the noise of dogs barking from the park whenever they may be present. Constant noise complaints from these residents may effect the publics ability to use the precious facilities. 17-40

On a continuing note, the loss of Arbor park as a facility for kids, including my own, to play in a community sport, would be a huge detriment. Remember all of these kids are residents of this community from Seal Beach/Rossmoor/Los Alamitos. I am currently a coach for a group of 8-9 year old boys and the comradery they get and the grow I've seen in them as they play together is tremendous. More so for the couple of kids on our team that have attention or social anxiety disorder diagnoses. Making Arbor park an obsolete green space by not having parking access would be tragic. 17-41

There are many more issues that I am sure will be included in the report: traffic flow on Lampson (or closures of the street due to an inevitable accident caused by increased activity and increased speeds), the increased use of College Park East's streets, parks and facilities by these new residents, noise/dust/pollutants from the construction, and the need for coordination between agencies and cities for Police and Fire services just to name a few.

The project as planned is not one that will work for the community. Adjustments must made once the environmental report is completed. 17-42

Thank you,

Ryan La Bounty

Tom Oliver
Associate Planner
City Of Los Alamitos
3191 Katella Avenue
Los Alamitos, CA 90720
Subject; 4665 Lampson Project

Dear Mr. Oliver,

I am a native born Californian with over 60 years residency in Orange County and a decades long resident of Seal Beach. Over the years I've witnessed the development of open space, farms, orchards, pastures into homes, commercial areas, shopping centers, roads and freeways and have experienced all the impact on infrastructure and traffic congestion this development naturally brings with it. Lately I've been seeing the demolition of old shopping centers and industrial buildings to reclaim land to build high-density residential areas. I recently learned about the proposed development of the 4665 Lampson Project for this purpose and wanted to voice my objection to this project for your consideration.

I am a capitalist and don't begrudge an investors desire to make a profit on his investments to create wealth and prosperity for his family and his business but I also feel that there is a societal aspect that should be considered so that residents, the city and the investor all takeaway something beneficial because a development like this impacts everyone.

17-43

I am concerned about the impact on traffic not only on Lampson, but also on the cross streets, Valley View and Seal Beach Boulevard and the freeway exits. The addition of new residential units on Lampson will increase traffic, noise, quality of life and pollution on this already busy street. This location will cause the local freeway exits to be even more congested that they are now even after the extensive improvement made by CalTrans over the past 10 years. This will impact everyone needing access to the freeway regardless if they live miles from College Park East and this 4665 Project. Along with increased traffic congestion is the need to mitigate safety risks as a result of the volume increase. This new development and added traffic with cause more accidents and pose higher risk to children and adults using the sidewalks and bike lanes along Lampson. The noise will have a negative impact on the homeowners in College Park East and the new development. I am asking for traffic, wildlife and safety impact studies be done immediately.

17-44

In closing I am just asking that this project be considered in a holistic way that takes into consideration the needs of the already existing neighbors and not just the revenue to the City and the profit to the developer.

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender sgbaksic@gmail.com

Good Afternoon, Mr. Oliver,

I have some concerns regarding the proposed project at 4665 Lampson Ave. As a resident who lives just off of Lampson Ave, a mom of 2 kids who have enjoyed Arbor Park for soccer games and practices, and a dog owner who utilizes the Arbor Dog Park frequently, I am very worried about the current proposal. 17-45

1. Traffic: adding this high density dwelling plan will impact traffic as well as public safety. I am concerned that without a new traffic light plan it will create a more hazardous situation on an already dangerous road. With only 2 lanes on each side, can Lampson handle an increase of approximately 500 more cars driving on that stretch of road daily? How will this public safety issue be resolved? 17-46

2. Recreation: I am concerned about the ability of our children to continue using Arbor park for sports recreation. Is there a plan to increase parking at Arbor Park? Can this be done without the removal of current green space in that area? Without additional parking it seems impossible for the region to continue enjoying that park. Is there a plan for parks to be built within the new community so as not to impact the current community use park at Arbor? Adding a residential area to increase the earnings of a developer at the expense of our current youth residents seems like a disgrace. 17-47

3. Environmental: I am concerned that some of the green space will be removed. As we all know, greenhouse gas emissions are already a problem and removing existing green space is going to exacerbate this problem. What is the plan for this? 17-48

4. Air Quality: Adding more cars to the area will reduce air quality and impact the health of local residents with issues such as asthma. Again, this is another issue that will negatively impact the lives of the current residents of your city. 17-49

I see no benefit to this housing development other than increasing corporate profits for a developer. How can the city justify impacting the safety, health and well-being of its current residents? 17-50

Thank you for your time and consideration,

Samantha Baksic

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender kmarkman@earthlink.net

Mr. Oliver,

I am writing to express concerns relative to the proposed development at 4665 Lampson. I live in Garden Grove, just off of Lampson, less than one mile east of the proposed development. Though not a resident of Los Alamitos my Garden Grove neighbors and I will most certainly be affected in a major way by such a development. While you dated your proposal October 3, 2022, my good friends who live in Seal Beach directly across Lampson from the project received your Notice of Proposal letter on Wednesday October 12. None of my Garden Grove neighbors have received your letter nor have any knowledge of the "Project". Unfortunately, I will not be available to attend your scoping meeting on October 20.

It seems as if notifying a majority of the potentially impacted neighbors would be prudent or at least the right thing to do. I am confident you will be sending out minutes of the meeting. Please retain my email address so that you may forward a copy of your minutes to me.

Regards,

Ken Markman

AYSO Region 159 environmental concerns regarding the proposed 246 Residential Unit Project for 4665 Lampson Ave a.k.a. West Ed Property

1. Arbor Park has approximately 100 parking spots, with 30 of those parking spaces located on the south side of the dog park. Region 159 has always strived to provide adequate parking for the dog park, which leaves roughly 70 parking spaces available on Saturdays. Therefore, Region 159 families and volunteers utilizing Arbor Park on Saturdays routinely park in the 4665 Lampson Avenue parking lot. That parking lot provides over 300 parking spaces that are essential to our use of Arbor Park and ensure soccer families are not parking in the nearby neighborhood of College Park East (CPE). The proposed project at 4665 Lampson Avenue states it will provide 557 parking spaces that will be entering and leaving the property from Lampson Avenue between traffic lights at Heather Street and Rose Street. The lack of signal control currently planned for traffic in and out of the development will adversely impact traffic safety on Lampson. It is already a dangerous street with a history of serious accidents. The number of planned parking spaces is insufficient for the number of planned residences. Garage spaces will be used as storage, or other purposes other than parking. Many of the homes will have more than two or three cars and drivers. These homes will have guests that will need parking as well. Region 159 is concerned Arbor Park or CPE residential streets will then become overflow for the planned development.

17-52

2. CPE has less park acreage than other neighborhoods in Seal Beach, Los Alamitos or Rossmoor. Arbor Park has helped fill that void by providing a large grass area to support organized and unorganized sports including soccer and baseball. The proposed new development details do not show any park space, such as a playground for residents. Region 159 requests the EIR include a listing of existing parks within a ½ mile of the planned development. In addition, we request the EIR include an evaluation if the planned development should include park space, such as a playground, basketball court, etc. for the residents of the planned development, to not further impact already limited nearby park facilities.

17-53

3. Arbor Park is currently home to many recreational activities, some of which begin in the early hours of the morning, plus a portion of Arbor Park is used for a very popular dog park. Region 159 requests that the EIR include an evaluation of noise at Arbor Park during busy weekends when the park is filled with soccer matches and the dog park is being utilized. To avoid future complaints from the new residents of the planned development about noise from soccer Saturdays and the dog park, noise impacts should be studied and if necessary, mitigation measures proposed. The noise study should be conducted to include all hours of the day on Saturdays when whistles, loud voices, cheering and other noises are made.

Good morning Tom,

I know you are probably bombarded with emails regarding the Lampson project. It's disappointing that it's even a question as to why it shouldn't be done. That park is part of a program for kids. It's disappointing that we can loose the value of neighborhood style. I moved here in 2018 because I loved the quietness and neighborhood style. I hope you can reconsider the Lampson Project.

City of Los Alamitos
3191 Katella Avenue
Los Alamitos, CA. 90740

File: LDR/CEQA
SCH: 2022090476
12-ORA-2022-02112
SR-22, SR-605
SR-405, SR-39

Dear Mr. Oliver,

Thank you for including the California Department of Transportation (Caltrans) in the review of the Notice of Preparation (NOP) of a Draft Environmental Impact Report (EIR) for the 4665 Lampson Avenue Project. The Project Applicant proposes to redevelop the existing office building with a residential development consisting of a variety of different product types, including: cluster homes, townhomes, and apartments. The unit mix would include 55 cluster homes, 114 townhomes, and 77 affordable multi-family apartment homes. The mixed density for the Project would be 20 dwelling units per acre (DUA). The Project would provide approximately 21,000 sf of common open space, which includes a central 14,000 sf neighborhood open space area. Under the City's R-3 development standards, the maximum building height for the Project is 35 feet. The Project would provide a total of 557 parking spaces: 459 parking spaces for the cluster homes and townhomes and 98 parking spaces for the affordable multifamily apartment homes. Vehicle access to the Project site would be provided via one driveway on Lampson Avenue.

The 4655 Lampson Avenue Project (Project) site is located in the City of Los Alamitos, Orange County, California. The 12.3-acre Project site is located north of Lampson Avenue and northwest of the intersection of Lampson Avenue and Rose Street. The project is located less than a half mile from State Route (SR) 405, The project is also two and a quarter miles from SR-605, two miles from SR-39 and almost a mile from SR-22. All four State Routes are owned and operated by Caltrans. Therefore, Caltrans is a responsible agency on this project, and has the following comments:

17-56

Transportation and System Planning

1. Caltrans encourages the design of Complete Streets that include high-quality pedestrian, bicycle, and transit facilities that are safe and comfortable for users of all ages and abilities. Improvements may include providing secure bicycle parking, pedestrian-oriented LED lighting, and comfortable connections to nearby active transportation and/or transit facilities. Complete Streets improvements also promote regional connectivity, improve air quality, reduce congestion, promote improved first-/last-mile connections, and increase safety for all modes of transportation.

2. New residential infill development offers an opportunity to encourage multimodal transportation options. Caltrans encourages the project to look at opportunities to include Complete Streets improvements in the project, and/or to improve bicycle, pedestrian, and transit access and connectivity to nearby bikeway, sidewalk, and transit facilities.

3. Consider including long-term bicycle parking facilities for the multi-family apartment units. Refer to APBP's Essentials of Bike Parking guide for long-term bicycle parking best practices. (https://www.apbp.org/assets/docs/EssentialsofBikeParking_FINA.pdf)

4. There is a Class II bike lane on Lampson Avenue. During project construction, if there are any impacts to the existing bike lanes, please ensure that appropriate temporary detours are provided to maintain safe bicycle access to Lampson Ave.

5. There is a Park & Ride leased by Caltrans located at the Federal Southwest Regional Lab parking lot. Include discussion on the existing Park & Ride, and potential impacts and mitigation. Also, please coordinate with Caltrans System Planning Unit regarding the existing Park and Ride facility agreement on the property.

17-57

Traffic Operations

6. Submit copies of all traffic related documents for review. The data used in the Traffic Impact Analysis (TIA) should not be more than 2 years old and shall be based on the Southern California Association of Governments Regional Transportation Plan Model. Use the Highway Capacity Manual methodology for all traffic analyses.

17-58

Freight Operations and Planning

7. Ensure that truck parking, ingress and egress, and staging will not interfere with vehicle parking, pedestrian paths, or bicycle lanes/bicycle parking.

8. Establish freight pick up & drop off times that do not coincide with peak commute hours to reduce passenger vehicle conflicts and congestion for freight. Consider designating on-street freight-only parking and delivery time windows so trucks will not resort to double parking, thus causing street traffic congestion.

9. For the residential development proposed, consider how many individual packages will be delivered daily to individual residences. Amazon lockers or an equivalent shared drop-off location can help reduce the amount of driving done by delivery trucks and can increase the efficiency of deliveries.

10. Work with local partners and community representatives to mitigate any truck traffic routing onto residential streets or conflicting with other road users, including and especially bicyclists and pedestrians.

17-59

Caltrans' mission is to provide a safe, sustainable, equitable, integrated, and efficient transportation system to enhance California's economy and livability. Please continue to coordinate with Caltrans for any future developments that could potentially impact State transportation facilities. If you have any questions, please do not hesitate to contact Julie Lugaro at Julie.lugaro@dot.ca.gov.

17-59 (CONT.)

Sincerely,

Scott Shelley
Branch Chief, Regional-IGR-Transit Planning
Caltrans, District 12

"Provide a safe and reliable transportation network that serves all people and respects the environment"

Hello:

Please find attached, our comments regarding the city of Los Alamitos pending development on Lampson Ave. We do not feel the location of the development is at all appropriate and should be halted.

Thank you. Please contact us if you have any questions.

Sincerely,

Bart and Alice O'Brien
3831 Fir Circle
Seal Beach, CA 90740
562-430-4178 (landline)

17-60

2022 Los Alamitos Lampson Housing Project concerns:

1. **Lampson is dangerous enough with speeding cars all hours of the day, and others going through red lights in the early morning hours, don't need or want a possible additional 500 cars on this street, being only 2 lanes on each side. Heavy and dangerous traffic.** → 17-61
2. **Housing is placed at the outer boundary of Los Alamitos, and it won't affect their city/neighborhoods, but will strongly hinder our neighborhood of College Park East (CPE), Seal Beach.** → 17-62
3. **Part of this housing project is low income housing? Low income housing has the potential to bring increased crime to our neighborhood. Our home values could/will decrease.**
4. **Minimal parking at this complex? There is the potential for increased traffic and parking and crowding in our neighborhood. Many households park on the street, not in their garages or driveways. Our streets will be jammed with Los Alamitos vehicles. Does CPE now need residential parking permits, and give tickets or tow Los Alamitos cars? Will Seal Beach now have to enforce parking permits, if this is needed? Costs for permits/enforcement?** → 17-63
5. **There is not a large police presence here at CPE, and we don't need one…but that may change with additional housing units across the street. With these new houses/people/cars/noise/traffic, our neighborhood will suffer from all of this.**
6. **This town has been known as "Mayberry by the Sea" and is the reason we moved here from Long Beach. This will certainly taint this title.**

This is a huge negative to our lives, homes, and lifestyle…..a quiet, safe and a small piece of heaven we love. Protect us city of Seal Beach and whoever has the power to stop this invasion of our small, great town. → 17-64

Aesthetics: More development on Lampson will not be pleasant to see. It's mainly open space right now with green space. More development will definitely not be aesthetically pleasing to this neighborhood and may cause loss of home value. → 17-65

Air Quality: Air quality will most definitely be impacted with the increased traffic on Lampson with the new development. During construction, with the heavy equipment and other vehicles, air emissions will increase and the → 17-66

cumulative impacts from this will definitely be a problem, especially with older residents and those with comorbidities.

17-66 (CONT.)

Construction Noise and road closure: This will definitely be a big problem for the residents at College Park East (CPE), Seal Beach. Lampson is already a major, busy road for drivers and is already very easily impacted by minor construction projects. This project will have a tremendous negative impact on Lampson and CPE residents.

17-67

Fire / Police / Medical Response: Will be hindered by increased traffic on Lampson. More traffic on Lampson means potentially more accidents and police/ medical response needed.

17-68

Greenhouse Gas Emissions: Definitely will increase due to construction related vehicles, heavy and small equipment use during construction, and increased car emissions from the increased traffic.

17-69

Hazards & Hazardous Materials: Lampson Ave is already hazardous because of the speeding, and increased traffic will cause it to be even more hazardous to drivers and pedestrians. In addition, the hazards of increased vehicle emissions which are hazards to our breathing.

17-70

Land Use & Planning: The proposed development is adjacent to an active military airfield and in potential danger from airfield accidents. A community development in this location is inconsistent with the surrounding land use.

17-71

Noise Pollution (vehicles on Lampson): There already is a noise issue from Lampson traffic. There will be added noise pollution from not only the increased vehicles on Lampson, but added vehicles on the 405 freeway from residents exiting to approach Lampson and the new development.

17-72

Population & Housing: Increased population and housing in Los Alamitos

17-73

will impact the adjacent CPE Seal Beach neighborhood, including CPE parking spaces, use of CPE parks.

17-73 (CONT.)

Parking in our neighborhood: Most definitely the increased population, traffic and housing in Los Alamitos will impact the adjacent CPE Seal Beach neighborhood parking spaces. Parking permits for CPE residents should be implemented to prevent parking spaces being taken by the new development.

17-74

Public Services: New development in Los Alamitos will cause added strain on Seal Beach public services including police and fire department due to potential negative impacts on Lampson Ave, i.e. traffic accidents, pedestrian related issues, traffic issues.

17-75

Recreation: More development means increased use of parks and park equipment (from non-city residents) resulting in need for more care and upkeep of parks/ equipment and need for additional funding (from Seal Beach residents) for upkeep.

17-76

Road impacts from heavy equipment: Lampson is a heavily trafficked street and very prone to potholes, which can result in vehicle damage. Heavy equipment will definitely cause more damage to Lampson than just the normal heavy traffic. This will result in the need for additional funding (from Seal Beach residents) for upkeep on road repairs.

17-77

Rodents: With this development, more people means more trash and litter around because most people are lazy and don't clean up after themselves, resulting in vermin like mice and rats.

17-78

Schools / Libraries: There will obviously be more crowding at schools with more development, which will mean higher student to teacher ratios which negatively impacts learning. The local libraries will be impacted with more use by people, and more upkeep and resources needed at the libraries.

17-79

Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc): Lampson is already a heavily used street between Seal Beach Blvd. and Valley View, and adding additional traffic will cause a tremendous cumulative impact on traffic safety. There is regular speeding and continuous traffic violations on Lampson that will definitely get worse with more development. More cars in CPE will also cause safety issues for pedestrians and residents.

17-80

Utilities & Service Systems: New development will cause added burden to utilities and service systems, of which many are in need of repair and frequent upkeep. Infrastructure is always lacking behind hasty development projects and adds stress to utilities and service systems.

17-81

Views from our backyards: More development on Lampson will not be pleasant to see from front or backyards. It's mainly open space right now with green space. More development will definitely not be aesthetically pleasing to this neighborhood and may cause loss of home value.

Most likely, Seal Beach residents will have to bear the burden of costs and decreases in current lifestyle and negatively impacted home values, and not the city of Los Alamitos.

Respectfully,

Bart and Alice O'Brien

3831 Fir Circle

Seal Beach, CA 90740

To: Tom Oliver
Subject: Concerns about proposed 246 Residential Unit Project for 4665 Lampson Ave
Date: Wednesday, November 2, 2022 9:43:33 AM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender jeffbranson1@gmail.com

Good morning Mr. Oliver,

This letter is in regards to the proposed 246 Residential Unit Project for 4665 Lampson Ave.

First: I am a resident of College Park East in Seal Beach and live on the closest street to the proposed project location (Ironwood Ave). I understand that sufficient parking will not be added to accommodate the 246 new structures that are proposed to be built, which will result in overflow parking be required in College Park East, particularly on my street, Ironwood Ave. Parking on Ironwood is already rather sparse. Not only will this result in decreased parking for College Park East residents, but this will have other negative impacts such as increased foot traffic around the clock, increased unsafe street crossings, which will likely increase crime and unsafe activities, not to mention further impact the already dangerous Lampson Ave. This is not the type of area I would desire to optimally raise my small children in.

17-83

Second: I understand that there is an open grass area in the proposed development, but not a park. College Park East parks, especially Heather Park, is already very busy most times of the day. It is certainly highly predictable that College Park East parks will be bogged down with regular visitors from this new development. College Park East parks are already smaller on average than other neighborhood parks, so there is severe concern that they will be too small to handle such overflow (let alone be able to absorb any recreational activities that Arbor Park will not be able to handle, should the proposed development move forward).

Third: Arbor Park is utilized by our entire community as a place for sports and other recreation (my family included). AYSO for example, will seemingly be forced to move as the area that is currently used for parking during the practices and games will now be consumed by the new development. As mentioned above, College Park East parks are not sufficiently sized, and therefore not capable of handling events that currently take place at Arbor Park. This certainly can't be viewed as positive for the community as a whole.

17-84

Overall, this whole proposed development seems as though it was hastily thought through without considering all of the environmental and social impacts. I know I speak for my family and most likely most of College Park East when I say that I respectfully, entirely disagree with the new development as proposed. Overall, this will not be positive for our community as a whole. Please reconsider moving forward with this proposed development.

If further information is required please feel free to contact me.

17-85

Sincerely,

Jeff Branson

Subject: Concerns about the Lampson Housing Project Being Developed
Date: Tuesday, November 1, 2022 2:44:38 PM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender adam.offenberg@gmail.com

Hello Los Alamitos and Seal Beach City Council Members,

My name is Adam Offenberg. I am a resident of College Park East (4400 Fir Ave). I was made aware about the Lampson Housing Project that is being proposed and I am writing to the city council to voice some of my concerns.

In looking at the plans that were made available, I am deeply concerned about the safety impacts of this project due to increased traffic. Many people including children cross Lampson at Heather to go to Arbor Park for AYSO Soccer Games and practices as well as the Dog Park. With over 200 units being put in, the increased traffic will bring more opportunity for traffic and pedestrian accidents. I would expect that the city would require the developer to perform studies on traffic flow in that area as well as research on pedestrian safety. A traffic flow study needs to take into account time frames such as 7:45 am to 8:00 am (Peak school and work traffic time). There is only one right hand turn lane onto Seal Beach Blvd which all parents use coming from College Park East to drop kids off at Los Alamitos Schools. It currently backs up to Old Ranch Country Club already at these times. With the addition of these units I can imagine a scenario where traffic will be back up to Candleberry or worse during peak times. 17-86

Something that will compound the safety issue is the lack of sufficient parking being planned for the development. Their needs to be a study focused on if the proposed parking for the development is sufficient to handle the amount of cars that will require parking by the owners, renters and guests of the dwellings being built. The plans that I have seen do not seem to include enough parking. So where will the excess cars be parked??? There is no street parking on Lampson so the only option will be for the excess cars to be parked in College Park East. This will bring in more traffic, especially by Heather Park (traffic and safety concern) where kids are always present. 17-87

While this is a Los Alamitos City property, the residents of these units will undoubtedly be utilizing Seal Beach City resources and amenities. Heather Park, Blue Bell Park, Almond Park College Park East Parking and Streets. Does either city plan to study the impacts of this influx of residents on said amenities? 17-88

There is signage posted on Lampson restricting trucks over 3 tons from using the street. With a large development project such as this, it would seem like this restriction would need to be lifted to accommodate the trucks / tractors / cranes and other large vehicles required to perform this build. Is this the case? The effects of this construction on Lampons Ave needs to be looked into. 17-89

I appreciate all of your attention on this matter.

Regards,
Adam Offenberg

Subject: Concerns Regarding the Proposed 246 Residential Unit Project for 4665 Lampson Ave.
Date: Wednesday, November 2, 2022 1:57:09 PM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender michelleannbeck@gmail.com

Hello,

I am writing in regards to some of the Environmental concerns regarding the proposed 246 Residential Unit Project for 4665 Lampson Ave a.k.a. West Ed Property.

1) This development will undoubtedly impact traffic on Lampson Ave. There are already major traffic problems on this road; especially, when there is road construction, accidents, or rain. These problems either cause the road to be completely shut down for hours at a time, to being able to travel in one lane, to flooding. Will there be alternate roads built to accommodate the traffic that this development will bring? I am unaware of any alternate routes that can be built when one considers that there are major constraints on all sides.

17-90

2) This development impact will seemingly have a negative impact on the use of Arbor Park and its neighboring dog park? The park is essential for AYSO 159 where all four of my children have played soccer. Thousands of families have used this park and parking lot to support their children in remaining active outdoors.

3) Will this development include a listing of existing parks within a ½ mile of the planned development. How will it impact the CPE parks? Will the EIR include an evaluation if the planned development should include park space, such as a playground, basketball court, etc. for the residents of the planned development, to not further impact already limited nearby park facilities.

17-91

Thank you

Michelle Beck

Subject: DEIR Comments for 4665 Lampson Ave
Date: Wednesday, November 2, 2022 9:25:08 AM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender michalekj@yahoo.com

Dear Tom Oliver and members of the Planning Division,

I'm writing in regard to development on 4665 Lampson. I'd ask that you take extra care in the DEIR to confirm that the plans ensure that use of Arbor Park not be negatively impacted. The park is a critical part of the community infrastructure for all of the youth involved in AYSO soccer. As it is, Los Alamitos has few designated soccer fields and spaces for kids to play organized, recreational soccer so Arbor Park is essential to providing kids healthy opportunities to be active, challenge themselves, and build healthy citizens that work well with others.

I support the need for additional housing in the area, but development of the site should ensure there is additional parking for Arbor Park. If the site is switched to residential use, there will be a need to provide accessible and sufficient parking to compensate for the evening and weekend parking available on the site now.

The new development should also include a play area for residents to offset additional demand for using Arbor Park. Field lines, grass problems (that can cause injury), and refuse from pets are already a challenge for the kids with the current levels of use. With many new neighbors planned, the builder should provide outdoor areas for pets and kids as part of the building plan to offset the impact.

17-92

The plans should also consider the noise levels for residents coming from the park and from parking. The units should provide sufficient sound barriers or building materials to allow residents their peace even when Arbor Park and the dog park are in high use.

Lastly, I would encourage the city to invest in more soccer fields in general. While there are a number of baseball fields kept up by the city, there are hardly any soccer fields. The community needs safe, well lit, and maintained soccer fields! The number of gopher holes and lack of field markings in Arbor Park is both dangerous and a disservice to the kids. In winter it also makes it hard for working parents to keep their kids active because the fields are not lit late enough. Please add improvements to the soccer fields as part of the city's long term plans!

17-93

Thank you,
Jenni DeSelm

DEVELOPMENT PROJECT 4665 LAMPSON AVENUE

Hello, my name is Lesley Chappell. I have been a resident in Seal Beach for the past 30 years and I strongly oppose your development at 4665 Lampson Ave.

I believe your project will have a negative impact on our environment and on the quality of life for the residents living in College Park East/Seal Beach, West Garden Grove, and Los Alamitos.

Your development will bring hundreds of more vehicles onto Lampson Avenue causing congestion and creating more pollution. This will have a major impact on our wildlife and residences living nearby. Having no traffic light at your development will force hundreds of your Vehicles to go west on Lampson Avenue or cut through the neighborhoods of College Park East causing a backup of traffic, potential car accidents and safety issues for pedestrians and children.

17-94

Since your development has no playgrounds, no markets, no walking paths, no tennis courts, and no pools, your residence will be coming into the nearest cities (College Park East/Seal Beach & West Garden Grove) for all their needs and recreation. This will cause overcrowding, excessive noise, pollution, traffic congestion, parking issues, and wear and tear to our facilities/equipment. Is there a plan to stop these issues before they become major problems to our environment and communities?

I believe a compromise of adding a traffic light, reducing your apartments down to two stories, and adding a playground would help to reduce some of the problems/environmental impact that your development will bring to our communities. Please consider how the added noise, bright lights, traffic, pollution, and overcrowding will affect the environment and residence of College Park East/Seal Beach and West Garden Grove before you continue with the current plans for your housing development project.

17-95

Thank you for your consideration,

Lesley Chappell

Subject: Disapproval of proposed 246 Residential Unit Project for 4665 Lampson Ave
Date: Wednesday, November 2, 2022 12:25:16 PM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender rebeccasbranson@gmail.com

Hello Mr. Oliver,

I'm writing to express my disapproval for the proposed 246 Residential Unit Project for 4665 Lampson Ave.

I am a resident of College Park East in Seal Beach and live on the closest street to the proposed project location (Ironwood Ave), so this greatly impacts my family and I. Safety concerns due to increased traffic, expected unsafe driving (u-turns at Heather, etc), and greater foot traffic on Lampson and throughout CPE are my greatest concerns. But also, insufficient parking provided for the new residents, lack of community space (parks), the view/noise from our yard, and the impact this will have on current recreational activities are also something that need to be addressed. 17-96

As aforementioned, safety for my family and others in the community is my number one concern. Inevitably, there will be a significant increase in traffic down Lampson, Seal Beach Blvd, and Valley View which are already congested especially during school drop off and pickup times. It's my understanding that there will be no added walking paths or any additional roads being built to access the shopping centers nearby, which means our already busy streets will be busier. Additionally, Lampson is already a dangerously fast street; adding an additional 246 homes (500+ more cars) will surely add to the already notoriously accident-prone street. 17-97

I understand that sufficient parking will not be added to accommodate the 246 new structures that are proposed to be built, which will result in overflow parking be required in College Park East, particularly on my street, Ironwood Ave. Parking on Ironwood is already rather sparse. Not only will this result in decreased parking for College Park East residents, but this will have other negative impacts such as increased foot traffic around the clock, increased unsafe street crossings, which will likely increase crime and unsafe activities. This is not the type of area I would desire to optimally raise my small children in. 17-98

I understand that there is an open grass area in the proposed development, but not a park. College Park East parks, especially Heather Park, are already very busy most times of the day. It is certainly highly predictable that College Park East parks will be bogged down with regular visitors from this new development. College Park East parks are already smaller on average than other neighborhood parks, so there is severe concern that they will be too small to handle such overflow (let alone be able to absorb any recreational activities that Arbor Park will not be able to handle, should the proposed development move forward). Given the above concerns, it doesn't seem 17-99

right that Seal Beach residents who pay for these (already small) parks will have to share our community space with Los Alamitos residents on a regular basis because the proposed community is not being planned appropriately. If this project does go through, a park should be added to accommodate its own residents.

17-99 (CONT.)

Given that we live so close to the proposed development, the noise from construction and view from our yard will be greatly impacted by a multi level building. If the project is approved, we would request that a taller sound and privacy wall be built down Lampson to ensure our current privacy and living situation is not impacted.

17-100

Arbor Park is utilized by our entire community as a place for sports and other recreation (my family included). AYSO for example, will seemingly be forced to move as the area that is currently used for parking during the practices and games will now be consumed by the new development. As mentioned above, College Park East parks are not sufficiently sized, and therefore not capable of handling events that currently take place at Arbor Park. This certainly can't be viewed as positive for the community as a whole.

Overall, this whole proposed development seems as though it was hastily thought through without considering all of the environmental and social impacts. I know I speak for my family and most likely most of College Park East when I say that I respectfully, entirely disagree with the new development as proposed. Overall, this will not be positive for our community as a whole. Please reconsider moving forward with this proposed development.

17-101

Please let me know if you need any further information. I appreciate your time.

Thank you,

Rebecca Branson

City of Los Alamitos

Subject: Lampson Project

As a resident of College Park East, I am concerned with the proposed Lampson Avenue Project.

I have lived in CPE for 23 years. This neighborhood has been here since the mid-60s.

It was developed during a time when nearly 79% of households had fewer than 2 cars.

Our parks were developed for CPE and not for extended communities.

Our streets and parking were developed for CPE residents.

17-102

The proposed Lampson Project will severely impact CPE.

Since I have lived here, Lampson Avenue has had many deaths due to accidents. Added cars and traffic will only increase the possibility of future accidents and fatalities. Not to mention added risk with heavy construction vehicles…

17-103

CPE has endured multiple construction projects with the 405 over the last decade. Noise and pollution have been unacceptable. The Lampson Project would add more suffering to CPE residence with noise and pollution.

17-104

Our parks were meant for CPE. No parks are planned for the new development. How can this be acceptable. The Lampson Project not having those resources would bleed over into the CPE/Seal Beach community and our resources.

17-105

As most new communities, parking is developed to only serve the residents living there and probably only 2 cars per household. When that expands due to children getting cars, or during holidays, there will be little to no additional parking for the Lampson Project residence expanded and extended families, especially during holidays. That parking issue will bleed over to CPE/Seal Beach and create parking issues within our community.

17-106

It is irresponsible to create a high-density community without the resources to support it.

For Los Alamitos residents, having a new community pop up on the other side of a large military base may sound like a great idea. It won't impact current Los Al residents' everyday life. It will add to the tax base, etc. But for us in CPE/Seal Beach, which is outside Los Al control, we are the ones being impacted. We will have the noise, the pollution, over population of our parks, will have parking impacted in front of our own homes, and increased traffic and possibility of accidents that impact everyone.

I believe that the plan is not well thought out. It won't support the Lampson Project residents. The lack of resources will create enormous pressure on CPE/Seal Beach residents.

Quality of life for those residents and as well as neighboring communities should be considered.

It is not just about how many homes can be crammed into a limited space and the maximum dollars that can be achieved for developers and Los Al.

I ask that you reconsider moving forward with this project.

17-107

Terry Pederson

Subject: ENVIRONMENTAL IMPACT for 4665 Lampson
Date: Wednesday, November 2, 2022 12:05:05 AM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender vnerbrown@gmail.com

Hello,
My enviornmental impact concerns for the proposed build at 4665 Lampson invlove more than just the immediate area of area of Arbor Park. A proposed build, such as the one at 4665 Lampson, in such a small community as Los Alamitos, has an enviornment impact that far exceeds the immediate area of the build site.

I am worried we do not have enough room in our elementrary schools, middle schools, and high school for the inflex of students. With the City allowing many - many more additional outter district transfers, than in the past, our class sizes are max'd out as-is. And play area at our schools, are already extrmely limited. We are one of the last remaining school districts with "Blue Ribbon" acalades and I would hate for our current students to suffer due to the inflex of students due to this build. I would like to see the environmental impact the proposed build would have on our local schools. 17-108

I am also concerned about our police and fire response. Last year, we voters, approved Measure Y, which increased sales tax to make up for the crippling costs of police and fire in Los Alamitos. I need to see the environmental impact the proposed build would have on our police and fire response by adding hundreds of housing units. 17-109

I am also concerned we do not have enough parks and play areas in Los Alamitos to support the current residents, let-alone the influx of residents in the proposed build. Little cottonwood Park is already packed during weekends and most summer weekdays. We have no room to accomodate several hundred or a thousand extra residents. I would like to see the environmental impact study that will address the need for more parks and play area space for our children. 17-110

In Los Alamitos, we also [only] have one hospital. The few times I have needed services from Los Alamitos hospital, it was clear to me, the hospital was under staffed and too small to service the current residents. I would like to see the envioronmental impact the proposed build would have on our only hospital by adding several hundred housing units and several hundres new residents. 17-111

Lastly, I am concerned we do not have enough youth camps, summer camps, and summer school activities to support the current residents, let-alone the influx of residents in the proposed build. The city needs to provide adaquate camps during school breaks, such as summer and winter. The current camps are regulary sold out and extremely hard to get a child registered into. I would like to see the enviromental impact on how the proposed build would effect the city's already strained youth camps. 17-112

Traditionally, when a new neighborhood begins a new build, like we recently saw in the unicorpated area of Irvine, the builders and home owners, need to submit and contribute to addtional taxes, such as mello-roos, to pay for the increase in city services. As current

residents, we are already max'd out with taxes and WILL NOT agree to any addtional taxes and WILL NOT tolerate any loss of current services or reduction in "quality of life." Unless the proposed build at 4665 Lampson would adequately improve the lives of current residents and will provide the same "quality of life" and services, I do not think the proposed build should be approved. Also, an "overnight" build of several hundred housing units will undoubtly put additional strain on services. Current residents should not have to bare the additional costs, or loss of services, or loss of "quality of life" because another buider wants to make another $100million.

I grew up in the Cities of Long Beach and Lakewood. I saw, first hand, the schools degrade, policing and fire response degrage and quality of life degrade when adding hundreds and thousands of housing units without increasing city services. Now, Long Beach has the highest taxation in the nation, their property tax is well over 1%, their crime rate has risen drastically over recent years, and their schools have all lost their "Blue Ribbon" status as well as class sizes approaching 30 kids per class. Please do not turn us into the City of Long Beach, Lakewood, or Hawaiian Gardens, or Stanton.

17-112

Subject: Environmental Impacts to the Surrounding Area of 4665 Lampson Avenue Residential Development Project
Date: Wednesday, November 2, 2022 3:21:40 PM
Attachments: image003.png
image004.png
image005.png
image006.png

I write as both a land use attorney and a homeowner living directly across the street from the 4655 Lampson Avenue Project. My home, located at 4601 Ironwood Ave., Seal Beach, is directly across Lampson Avenue from one of the two driveways into the proposed Project. As a result, the direct impacts of the potential Project are literally directed into my property and those of my neighbors on Ironwood. These impacts include increased light pollution, sound pollution above the roadway standards allowed, vibrations (which while felt outdoors are one thing, the perceived intensity of such impacts are much greater indoors with rattling windows, doors and the shaking of structures), increased traffic, impacts to neighborhood traffic on already busy streets, loss of park space utility and unsafe road conditions.

17-113

These impacts reach multiple sensitive receptors in the College Park East neighborhood and cannot be underestimated. Notably, the development as currently planned and constituted cannot mitigate any of these impacts.

First, three of the structures to be built are three-stories tall, exceeding the height of the current use of the property. These three apartment buildings are planned for an area currently used as a parking lot that is directly across Lampson from our home. This parking lot has normal usage seven days a week, but hardly any use at night. To introduce a dense urban project into the site will magnify the duration and type of use. The amount of light and sound that will emanate from 70+ apartments and its residents is a clear environmental impact that cannot be mitigated to manageable levels, particularly during nighttime hours. The developer has no plan for sound dampening or addressing the increased light pollution that will occur from this intensive use.

17-114

Second, the proposed project will introduce 500+ cars per day onto Lampson Avenue, already a crowded street with 19,000 average daily trips; the ADT

17-115

amount is expected to rise beyond 20,000 in 2025 and that is without the proposed projects increases. The rise in noise and vibration levels attributable to the project alone are a significant environmental impact that cannot be mitigated. Notably, the developer is doing nothing to even address this issue.

17-115 (CONT.)

Third, the introduction of new and unplanned for vehicle trips is but one issue created by the project. The number of units versus the number of parking spaces provided may work in paper calculations for a series of mandates and density forgiveness measures but are not realistic and do not take into account the actual impacts for the surrounding neighborhood. Apartments, townhomes and cluster homes will likely have multiple cars tied to each unit as a fact of modern life. Moreover, there is no public transit that is realistically usable for the new project. There are minimal bus stops on Lampson Avenue because the street is not wide enough to accommodate a turn out lane. The project as designed does not contain enough parking to serve 246 units. If each unit has two vehicles associated with it, the approximately 500 added vehicles will overwhelm the scant parking provided. These vehicles, plus guests, will have no choice but to park in College Park East and cross Lampson on foot. College Park East is fully developed and occupied with much of the street parking already utilized. There is simply no additional parking availability. Again, the developer is relying on density credits for a paper development – the City is required to study the actual environmental impacts; parking is a massive impact that cannot be mitigated with the density, uses and design of the proposed project.

17-116

Fourth, Lampson Avenue is the only route for ingress and egress for the Project. Lampson is already heavily-travelled as discussed above. As a two-lane roadway with *minimal* medians separating the lanes now and tremendously limited bike lanes, Lampson is a limitation that cannot be expanded because it is fully built out on both sides in both directions. The developer's plans for the project dictate that vehicles leaving the site must turn right onto Lampson because a left-turn movement cannot be safely made and there are no turnout lanes to accommodate the flow of vehicles going both left and right out of the project. As a result, if half of the cars presumably want to go in each direction, but those wanting to head east on Lampson cannot do so,

17-117

that means 250 vehicles per day are going to attempt to make a "u-turn" at the intersection of Lampson and Heather Street, a key intersection for CPE residents as it is one of only four entrances into the community. Lampson has a very short dedicated turn lane onto Heather that will be quickly overcome during peak travel hours. Heather Park is heavily utilized by the residents of CPE and there are adults and children riding parks in and near the park. Introducing new and unsafe turn movements along with hundreds of new vehicle trips per day into the Heather/Lampson intersection is a significant environmental impact that cannot be mitigated. The developer is creating this impact but doing nothing to address it.

17-117 (CONT.)

Fifth, this project takes the concept of urban in-fill to a ridiculous extreme. Between 500 and 1000 people will be crammed into the site because the developer is taking advantage of every density forgiveness ratio possible with basically no open space to be built. The residents and their guests will be forced to recreate at Heather Park but will bear none of the costs for upkeep or increased impacts because it is located in Seal Beach, not Los Alamitos. The park facilities and tennis courts are already oversubscribed with the current residents, adding in a few hundred more is another unplanned impact that the developer is exploiting for financial gain at the cost of environmental impacts to the surrounding residents.

17-118

Along the same lines, Arbor Park is utilized for the local AYSO soccer league on many weekends during the year, providing a great recreational opportunity for local kids. The current parking lot at the site is a key component of the use, as it allows for 300 vehicles to safely park and accommodate the large use of the fields. This project will eliminate that entire parking lot, forcing AYSO parents and guests to park in College Park East as there is simply no other parking within a walkable area in either direction. Adding these vehicles onto the project's "new" vehicles will only further impact CPE's residents.

17-119

Accordingly, I ask that the City of Los Alamitos insist that these impacts (along with a myriad of other impacts that people far smarter than me can and have identified) be studied as part of the land use and environmental approval process. **Ultimately, this project should be denied along with the use, zoning**

17-120

and other waivers/changes requested by the project applicant. There is a feasible use to be made of the 4655 Lampson Avenue property – jamming a project down the communities' throats without the proper design criteria is simply not the way forward.

17-120

CAA
PROFESSIONAL BUILDING & SAFETY/ENGINEERING/INFRASTRUCTURE MANAGEMENT

MEMORANDUM

To: Tom Oliver, Associate Planner
From: Jordan Koga, Environmental Analyst
Date: November 1, 2022
Subject: 4665 Lampson Ave. PWQMP Review #1

Charles Abbott Associates, Inc. (CAA) Staff have completed the review of the Preliminary Water Quality Management Plan (WQMP) for the project located at 4665 Lampson Ave., in the City of Los Alamitos. The project applicant proposes to redevelop the site to construct 76 buildings consisting of 2- and 3-story detached single family homes, 3-story townhomes, and 3-story apartment buildings, which totals 12.12 acres. The project applicant has proposed seven (7) Modular Wetlands Systems for Proprietary Biotreatment (BIO-7) as the post-construction best management practices (BMPs) for compliance with the current MS4 Permit.

WQMP Deficiencies
The project applicant must address the deficiencies indicated below prior to approval of this PWQMP.

General

1. The PWQMP shall include a signed certification statement from the project owner as well as a signature and stamp from the engineer of record, which post-dates the final revision. This may be satisfied after it is determined that no further revisions are necessary.
2. Include the project's signed and notarized Maintenance Covenant with the O&M Plan, in the Final WQMP. Please include these items with the Site Plan Exhibit as a combined attachment to the Final WQMP. The O&M Plan, Maintenance Covenant, and Site Plan Exhibit will be recorded as a standalone document at project completion.
3. Provide the month, day, and year of original plan development as well as all subsequent revision dates on the Title Page.
4. It is acknowledged that a 90% impervious percentage was selected as a conservative value for preliminary design. Please note: a thorough review will take place in the final design stages once an impervious percentage is determined and the BMP size may be affected due to the change.
5. Demonstrate the LID BMPs are designed for the peak flow rate for the 1-year, 1-hour storm event per the Trash Provisions.

2

CAA
PROFESSIONAL BUILDING & SAFETY/ENGINEERING/INFRASTRUCTURE MANAGEMENT

Section I

6. Provide the water quality conditions of approval verbatim in the Final WQMP.
7. Revise Section I to include the TMDLs for the San Gabriel River. Refer to the TMDLs page on the Orange County Public Works website.

Section II

8. Revise Section II.1 to specify the development category. The provided MWQMP language is acceptable.
9. Revise the last paragraph in the project narrative to update the following conflicting statement: "divided into five (7) Drainage Management Areas (DMA)".

Section III

10. The following statement in Section III.2 contradicts the provided groundwater results and the geotechnical report: "Groundwater was **not** encountered in three of our borings…". Revise accordingly.
11. Revise the receiving waters in Section III.3 to match the drainage narrative in Section II.1 and the provided Susceptibility Analysis of San Gabriel-Coyote Creek HCOC map. It does not appear the site is directly tributary to Coyote Creek nor San Gabriel River Reach 1. Additionally, provide the 303(d) listed impairments for San Pedro Bay Near/Off Shore Zones and update the 303(d) listed impairments for San Gabriel River Estuary per the most updated list (California 2020-2022 Integrated Report).
12. Update the TMDLs for the receiving waters in Section III.3. It appears the 303(d) listed impairments were included in this section. Refer to the TMDLs page on the Orange County Public Works website.

Section IV

13. The DCV values provided in Section IV.1 do not match the values calculated utilizing the numbers provided. It is acknowledged that these DCV values will change once the DMA's imperviousness is finalized but the volumes shall be accurate per the values provided. Revise accordingly.
14. Update the narrative in Section IV.3.3 to state the harvested water demand and feasibility assessment was performed per Worksheet J and the results show that evapotranspiration and rainwater harvesting BMPs are infeasible.

WQMP Site Plan

15. Provide surface flow arrows.
16. Label the ultimate discharge/outlet point for the project site.
17. Provide a sample of the storm drain stenciling that will be utilized on-site.
18. Show the private storm drain system, underground storage system, and any additional catch basins. A separate exhibit may be necessary.
19. Provide a conceptual detail of the storm drain system connecting to the underground

storage system, which connects to the sump pump to discharge off-site. Provide all associated elevations.

Attachments

20. There are several conflicting answers provided for Table 2.7, such as Items 1, 5, 9, and 11. Revise accordingly.
21. Update the Project area on Worksheet I to match the total site area.
22. Update the value from Table X.8 for Item #14 on Worksheet J to ensure the value is for the design capture storm depth of 0.8 in.
23. Provide the site-specific MWS detail sheets for all proposed units. Ensure the high-capacity model details are also included.
24. Provide the most updated TAPE/GULD certification documents for the proposed MWS.
25. Provide all applicable grading plan sheets.

If you have any questions or require additional information, please feel free to contact me at (949) 421-9373 or jordankoga@caa.inc.

Tom,

My name is Eric Holmes and I live in the College Park East neighborhood, right across from the proposed housing project on Lampson.

Not sure who to chat with there, but our MAIN park and playground for the kids and where we have all of our events is at Heather Park. That park cannot handle additional kids, it's small and needs to be remodeled.

I think the parents of College Park East would be much more receptive if there was some agreement to split the remodel of that park with the city of Seal Beach.

I've CC'd Jill Ingram on this email as well.

I have started the Seal Beach Playground association and have over 100 members that can help plan. All of whom live in CPE.

Let me know how I can help facilitate this.

Thanks!
Eric Holmes

Hello City of Los Alamitos and Seal Beach-
I have been a resident of CPE for the past 6 and a half years with 2 elementary school kids who attend Lee. The proposed Lampon project is going to cause havoc in our amazing neighborhood and our Community.

The added traffic to the already busy Lampson Ave will make dropping the kids off at school and commuting to work even more difficult than it already is (only one turn lane to get from Lampson to Seal Beach Blvd!) Not to mention the speed that the cars already drive, adding more cars without widening the sidewalks or the already insanely dangerous bike lane. 17-124

There are nowhere close to enough parking spaces for the residents of this community and therefore will drive those cars into our neighborhood - and when they do, they will take up our parking spaces. We already have issues with people coming and parking and leaving their cars in the neighborhood for several days since it is safe, so now we will have to be utilizing police services more to have those cars cited or towed - is Los Alamitos PD going to cover these calls, no probably not, Seal Beach PD will have to incur these extra calls. 17-125

On Weekdays and Weekends AYSO utilizes Arbor park for soccer practice - where will these families park when the Arbor Park Parking is being utilized by the residents or their guests? More traffic crossing Lampson with young kids. Additionally, Arbor Park Dog park will have even more restricted parking - and it is the best dog park around - I have utilized it for 15 years! 17-126

The Right Turn only option for residents coming out of the complex will create congestion and dangerous situations at the corner of Heather and Lampson - Also the corner of where Heather Park is - the most heavily trafficked park in CPE. There will be u turns and running of the red lights more than there already are. This is the intersection where the major school bus pick up is every morning and afternoon - we need to keep our kids safe from this added traffic! 17-127

The Lampson Project only includes 14,000 square feet of open space, but that space does not include a playground for kids, therefore those families are going to be utilizing our CPE parks - is Los Alamitos going to help upkeep and repair our current parks? An added 246 units will overcrowd our already heavily utilized parks, not to mention will add more noise for the neighboring homes.

I am concerned for the safety and well being of my children and the neighborhood - we chose CPE over other neighborhoods for specific reasons and this project will bring down the quality of life in CPE! 17-128

Thank you for reading and taking these items into consideration!

November 1, 2022

RE: Stop The Lampson Project

This letter is to the Los Alamitos Planning Department, to T&B Planning, to MJW Investments, the Builder/Development Company and to the surrounding cities and residences that will be affected.

It was apparent at the 10/20/2022 Los Alamitos City Meeting that the City of Los Alamitos, together with T&B Planning (handling the Environmental Impact Study), and the Builder/Developer, MJW Investments Company's focus was to keep this project as hush hush as possible so the citizens and families living in the nearby areas would neither know about, nor be able to voice their

17-130

concerns to this proposed project on Lampson Ave. With that said, aside from Los Alamitos, the outcome of this project will have long term safety issues affecting several surrounding neighborhoods - in addition to College Park East, the residents immediately across the street on Lampson. The neighboring residents of West Garden Grove (to the immediate east), Los Alamitos (adjacent to the Joint Forces Base), and Rossmoor (home to four key Los Alamitos elementary schools) will all be affected by increased traffic and safety issues.

17-130 (CONT.)

Pros and Cons to this Project:
Pros:

Cons:

1.) **Land grab** to build extremely compacted / high density housing on 12.3 acres zoned for business … not zoned for residential.

17-131

2.) Extremely **limited accessibility** "into" and "out of" the complex. This, in and of itself is a huge fire hazard and safety concern for police/emergency access.

17-132

3.) **Dangerous traffic / pedestrian safety issues** – this project is directly off Lampson Ave. without any designated stop lights to be put in.

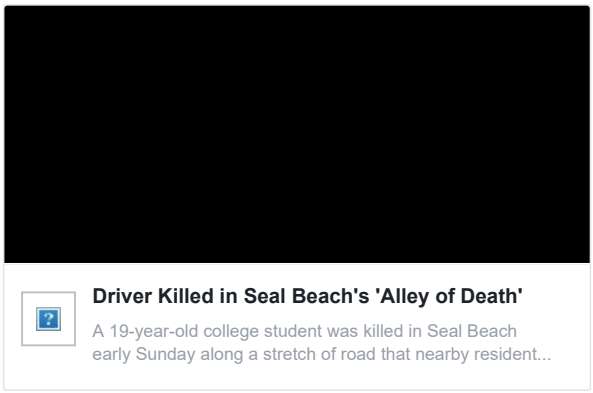
17-133

a.) This is already an accident-prone main street – which will only intensify with well over 240 + additional cars and school buses coming and going during the day –

17-134

especially during high traffic rush hours.

17-134 (CONT.)



b.) At this Lampson Ave. location, the exits can only be right turns – taking you west on Lampson Ave. towards Seal Beach Blvd. - a busy main highway. For those wanting to head East towards Valley View St., the only option is to pull a U-turn at Heather Park - which is dangerous with the College Park East residential traffic.

c.) Lampson Ave. is a key thorough way to avoid the 405 Freeway stop & go traffic, a direct route to and from Valley View St., and one of the few remaining safe routes for the established Los Alamitos High School cross country teams.

17-135

d.) For years Lampson Ave. was known as the **"Alley of Death"** for motorists (Driver Killed in Seal Beach's 'Alley of Death' before raised median strips were put in as safety dividers. What is to prevent this street from becoming that again with all the hundreds of additional vehicles / pedestrian bikes (and many more passengers/pedestrians) on a daily basis, in a hurry to get to and from work and/or taking their kids to and from school? Who wins or worse yet, who loses in this situation? What are the statistics and number of accidents / near misses reported on this street alone within the last 5 /10 years, let alone on a weekly/monthly basis? Now add an additional 500+ residents to this highly traveled street when everyone is in a hurry. How will the statistics read then?

17-136

17-136 (CONT.)

4.) The meeting drew great **concern for the lack of parking** in the complex as T&B Planning played down the fact that each housing unit may likely have 2 or more cars. If there is already not enough planned parking within the complex, then who will be forced to face the brunt of providing parking? Most likely, the College Park East residents directly across the street - who themselves neither have the extra space for this nor should be subjected to "deal with it."

17-137

5.) College Park East is a family community that is well known for its well visited weekend **Soccer Little League games**. The bulk of attendees' park across Lampson Ave. on this property. What are your plans in how best to handle this ongoing successful tradition for youths and their families in this community?

17-138

6.) The **renderings** and large number of proposed homes, show as, **thrown together boxes** all packed into an area the size of a sardine can – with little room to walk around, little room to park, and little room to safely drive in and out.

17-139

Hello,

My name is Asheena Lee. I am a resident of Parkewood in Los Alamitos. I have a few concerns about the Lampson project.

1. Please consider the dangerous increase in Uturns. We need a no Uturn sign and added lights to prevent mortality and morbidity. 17-140

2. Please request that they add more parking. Living in Parkewood I am aware of how quickly parking spaces fill up. We already have a problem with so many parked cars on the road it is often dangerous driving and walking. There are narrow passages with two-way traffic trying to get into a small space due to so many street vehicles. This will only be amplified if the Lampson project does not have appropriate parking. Parking garages or fewer units would help with this. 17-141

3. Please consider requiring a public park. We do not have many parks here, and the park we have is in seal beach. With adding so many residents, we will need a safe place for children to play. Parks decrease crime and increase the quality of life. Please consider requiring some of the land for a park for the children. 17-142

4. Consider keeping some of the land commercial. There is not much commerce on the street here. It may be a great place to keep a few units that could be used for small restaurants such as coffee shops, bakeries, or restaurants. This would bring further revenue to the city and reinvigorate the community. 17-143

Thank you,
Asheena Lee

Subject: PROPOSED 246 RESIDENTIAL UNIT PROJECT FOR 4665 LAMPSON AVENUE A.K.A. WEST ED PROPERTY
To: <elishanboothe@gmail.com>

Good Evening Friends and Families

We are sending out this informational email out to help spread the word of the current proposed project in the works with the City of Los Alamitos for the West Ed property located at

4665 Lampson Avenue and how it will affect our Region of 159 and the residents of Los Alamitos and Seal Beach communities.

Our region has been part of the local community for over 40 years, and our mission is to provide world-class youth soccer programs. For more than 20 years, Arbor Park has been our primary
facility to provide our community-based soccer programs. In the fall and spring seasons Arbor Park is a critical facility for our recreational, all-star, and club soccer programs, and in the summer it hosts soccer camps. Our primary season is in the fall,
when over 1,000 players and their families come together as a community to practice and play soccer. Due to the popularity of our soccer programs at Arbor Park, we have always utilized the parking lot at

4665 Lampson Avenue and have done so for over 20 years.

The City and other entities involved in the project are in the draft stages of working on an "EIR" which is an Environmental
Impact Report (DEIR) for the proposed project. They are taking comments/concerns regarding the environmental impact of this project from the
community with a deadline of Wednesday, November 2, 2022. Below we are sharing our concerns about the project so that the community can know and understand the impact that this proposal will have
the Region and the community. We urge you to share your comments and concerns about the environmental impact this will have on your community as well. All correspondence on this issue should be sent to..

Tom Oliver, Associate Planner
City of Los Alamitos Planning Division
3191
Katella Avenue

17-144

Los
Alamitos, CA 90720
toliver@cityoflosalamitos.org
(562) 431-3538, Ext. 300

AYSO Region 159 environmental concerns regarding the proposed 246 Residential Unit Project for

4665 Lampson Ave a.k.a. West Ed Property

1. Arbor Park has approximately 100 parking spots, with 30 of those parking spaces located on the south side of the dog park. Region 159 has always strived to provide adequate parking for the dog park, which leaves roughly 70 parking spaces available on Saturdays. Therefore, Region 159 families and volunteers utilizing Arbor Park on Saturdays routinely park in the 4665 Lampson Avenue parking lot. That parking lot provides over 300 parking spaces that are essential to our use of Arbor Park and ensure soccer families are not parking in the nearby neighborhood of College Park East (CPE). The proposed project at 4665 Lampson Avenue states it will provide 557 parking spaces that will be entering and leaving the property from Lampson Avenue between traffic lights at Heather Street and Rose Street. The lack of signal control currently planned for traffic in and out of the development will adversely impact traffic safety on Lampson. It is already a dangerous street with a history of serious accidents.

The number of planned parking spaces is insufficient for the number of planned residences. Garage spaces will be used as storage, or other purposes other than parking. Many of the homes will have more than two or three cars and drivers. These homes will have guests that will need parking as well. Region 159 is concerned Arbor Park or CPE residential streets will then become overflow for the planned development.

17-144
(CONT.)

2. CPE has less park acreage than other neighborhoods in Seal Beach, Los Alamitos or Rossmoor. Arbor Park has helped fill that void by providing a large grass area to support organized and unorganized sports including soccer and baseball. The proposed new development details do not show any park space, such as a playground for residents. Region 159 requests the DEIR include a listing of existing parks within a ½ mile of the planned development. In addition, we request the DEIR include an evaluation if the planned development should include park space, such as a playground, basketball court, etc. for the residents of the planned development, to not further impact already limited nearby park facilities.

3. Arbor Park is currently home to many recreational activities, some of which begin in the early hours of the morning, plus a portion of Arbor Park is used for a very popular dog park. Region 159 requests that the DEIR include an evaluation of noise at Arbor Park during busy weekends when the park is filled with soccer matches and the dog park is being utilized. To avoid future complaints from the new residents of the planned development about noise from soccer Saturdays and the dog park, noise impacts should be studied

2

and if necessary, mitigation measures proposed. The noise study should be conducted to include all hours of the day on Saturdays when whistles, loud voices, cheering and other noises are made.

If you have any questions/comments/concerns of your own regarding this project please reach out to the City of Los Alamitos and express them!

Thank you for your continued support of our Region!

In regards to the PROPOSED 246 RESIDENTIAL UNIT PROJECT FOR 4665 LAMPSON AVENUE

Development of this project would impact the community in a negative way by taking away parking opportunities for the AYSO soccer fields and dog park

It will increase traffic and pollution .

Youth soccer provides life skills for our youth by build leadership and teamwork. Soccer also keeps kids physical fit and gives structure and purpose .

Access to parking for the fields is vital. I am not in favor of this project as proposed.

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender melaniegotto@gmail.com

Hello,

I am concerned about the proposed West Ed Property. I urge you to reconsidered moving forward with this development as it will negatively impact my family as a home owner in College Park East and a parent of players within AYSO region 159. I'm concerned about noise pollution, overcrowding of Heather park, non CPE residents crowding the streets in CPE with their cars, traffic safety on Lampson, and the negative effects this project will have on AYSO soccer. Please do not move forward with the Lampson Ave West Ed property.

Sincerely,
Melanie Gotto (CPE homeowner/AYSO parent)

Mr. Oliver,

I am a resident of the College Park East community in Seal Beach and I am writing to express my grave concern regarding the impacts of a potential housing development slated to be built at 4665 Lampson Avenue in Los Alamitos ("Lampson Avenue Project").

This new, high-density development will have a myriad of negative impacts on our community both from a quality of life AND environmental standpoint. As a College Park East resident who lives on Ironwood Avenue, which runs parallel to Lampson Avenue, I already experience a great deal of sound pollution from the ever-increasing traffic just beyond my backyard wall. Adding a development to accommodate 800+ additional residents, along with their guests, will only add to the sound pollution from the added traffic and make the northside Ironwood Avenue residents' backyards unbearable during certain times of day.

17-147

Just as concerning as the sound pollution from additional vehicles on Lampson is the increased traffic as a result. Lampson is already a very dangerous road with numerous accidents occurring on a regular basis. The area of Lampson that runs along the community of College Park East has historically been known as "The Alley of Death," due to the significant number of fatalities that have occurred in the area. With no space to expand Lampson, the increased traffic will only add to the number of dangerous and deadly accidents. Below are some examples worth noting of accidents in this area of Lampson. One of these is from this past month (October 2022). Another involves a child. I have 3 children of my own, who often ride their bikes in the area, and I do not want their abilities to ride in the area to be hindered by uncontrollable traffic that cannot be accommodated by the Lampson intersections.

General safety and pedestrian safety should be a top priority for both the city of Los Alamitos and Seal Beach. An increase in injury and death rates in the area should not be on anyone's conscience.

https://www.sunnews.org/drunk-driver-gets-15-to-life-for-lampson-avenue-death/
https://www.latimes.com/archives/la-xpm-1989-09-11-me-1559-story.html
https://www.oc-breeze.com/2022/10/04/219326_seal-beach-police-investigating-serious-traffic-collision-involving-two-vehicles-on-lampson-avenue/
https://www.laweekly.com/rider-hospitalized-motorcycle-crash-lampson-avenue-seal-beach-ca/
https://www.ocregister.com/2013/06/17/lampson-speeds-scrutinized-after-accidents/

17-148

While dangerously increasing traffic and noise pollution are of utmost concern, there are also several other factors that are essential for the City of Los Alamitos to investigate. Below is a list of concerns that MUST be addressed in the environmental impact assessments:

- Aesthetics (visual perception of environment)
    - Daytime glare and its impact on drivers, cyclists and neighboring homes

17-149

- Nighttime illumination
- Existing visual characteristics

- Property Values
  - Existing home values are likely to decrease and be adversely impacted due to additional multi-family dwellings alleviating housing pressure in an area that is primarily single family homes
- Air Quality and Environmental Conditions
  - Increased carbon monoxide emissions
  - Increased particulate matter
  - Increased greenhouse gas emissions
- Biological Impacts
  - The appropriate agencies must investigate how this development will impact local wildlife
  - There are a large number and variety of birds in the area – hawks, falcons and other large birds of prey, as well as squirrels and other varieties of smaller birds
    - Do any of these birds nest and feed in the vicinity of the development site?
    - Do any of these birds of prey have special environmental protective or endangered status?
  - How many trees will be eliminated for this project and how will this impact shade and air quality?
- Geology and Soils
  - Impact on drainage in the area
  - Runoff concerns
  - How will the local soccer field conditions be impacted?
- Public Protection Services Impact
  - Fire protection
    - High population density requires additional fire protection services
    - Multi-family dwellings tend to require more fire protection
  - Police protection
    - High population density requires additional fire protection services
    - Is there an expectation that crime may increase in the general vicinity due to a higher population density?
    - Additional police support from the City of Seal Beach will be required as a result of a development that is taking place in a separate city (Los Alamitos), which will impact Seal Beach taxes
- Other Public Services
  - Library
    - Can local libraries accommodate the additional residents?
  - Parks and Recreation (There are no planned parks or play areas for the residents of this development which will directly impact College Park East parks)
    - Can local parks accommodate the additional residents causing an increased rate of wear and tear?

As the leader of the city council in Los Alamitos, it is imperative that you perform the necessary steps and due diligence to halt the Lampson Project. I urge you to disapprove the current proposed development plan, reassess and preserve the well-being of the surrounding communities.

Regards,

Mike and Jessica Polye

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender geraghtycpa@gmail.com

For 20 years the parking lot on lampson at West Ed has a CalTrans park and ride. New development is missing the park and ride.

Also for 20 years the parking lot at West Ed has been used as a community parking lot to support the community park, Arbor that host AYSO games.

I don't see any plan for keeping this parking lot for the community park.

This need to be evaluated in the EIR.

Good afternoon,

I'm a resident of College Park East and am writing to express my concern about the new proposed housing development on Lampson. I hope that the city will not allow the approval of this development. This development will overpopulate Lampson/CPE area and cause overflow parking in our neighborhood. This will also make traffic on Lampson even worse than it currently is, which has caused many fatal accidents over the years. Please don't approve the plans to move forward.

Thank you,

Megan Cecala

From: user1963@yahoo.com
To: Tom Oliver
Subject: Lampson development project
Date: Wednesday, November 2, 2022 10:59:45 AM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender user1963@yahoo.com

I write to express concerns about the proposed development of the land on Lampson, adjacent to the military base and golf course. Both Arbor Park and the proposed development property are home to many types of wildlife. There are rabbits, coyotes, and red-tailed hawks, to name a few, including endangered species. On a regular basis, I see no fewer than three (3) pairs of nesting Red-Tailed hawks in the trees on the property. Any plan MUST include parameters for the development that will NOT cause nesting parents or babies to be disturbed during breeding season. A wildlife expert or avian biologist must be specifically consulted to insure that endangered species and nesting birds are not disturbed in violation of the Endangered Species Act.

17-158

Another concern is that the various animals on the site will lose their homes, and will likely travel into the local neighborhoods seeking refuge. The homeowners in the neighborhood will likely demand that the city trap and kill these animals. This is not acceptable. Governments continually encourage people to fear wildlife, therefore giving said government the basis for killing off the wildlife. Any plan for the property MUST include specific details of how the wildlife will be effected by the plan and MUST include a NO KILL requirement for a set number of years until the wildlife can relocate themselves and find new homes and resources.

17-159

Finally, since the state is continually battling the current or next drought - where is the water supply originating to provide for this project? Is the re-directing of water to this project from another source, further causing harm to endangered species in the locations where the water is taken from? Will taking more water from rivers, and other sources cause the loss of wetlands needed for migratory animals, who again are endangered species and protected by Federal law?

17-160

Additional concerns related to the project, but not the EIS include national security issues in placing additional people and houses in such close proximity to a military installation. Also, while the state has mandated low income housing, placing such housing adjacent to middle class housing will likely lower the value of adjacent homes, and possibly lowering property taxes of those who request a reassessment. Devaluation is also likely since most low income housing is accompanied by crime, drugs, unemployment, and poorly maintained housing itself? What plan is there for additional police battle increases in crime? Where do the additional resources originate for code enforcement of housing maintenance rules? What plan is there to deal with 1000 additional cars traveling along Lampson and needing to merge onto Seal Beach Blvd. - a place is already currently impacted by excessive traffic?

This is a poorly designed plan, that will kill long term wildlife, lower the standard of living for all in this area, and add more issues to the already precarious issue of water in the state. I hope the city will reconsider any support for this plan.

Respectfully Submitted.
L. Pellegrini, Ph.D.

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender s.freeland@gmail.com

Hi Tom,

Lampson is already a dangerous street. Just two weeks ago a driver was killed in an auto accident. Allowing high density housing at the West Ed complex is crazy. The amount of cars turning left into the housing project and those coming out will cause many more accidents and fatalities. The increased traffic will be awful.

17-162

Arbor park has been utilized by sports teams for over 40 years. How long until the park gets shut down because of noise complaints by the residents of the new housing project?

To put so many houses and apartments in such a little space with NO playground is cruel. It will force kids to have to cross lampson to go to Heather Park across the street.

17-163

The space needs to be better utilized. If housing needs to go in that space then there needs to be more parking, have it connected to Arbor park and have a playground built. The developers are trying to shove as many houses in there as possible to maximize their profits, not benefit the city.

17-164

Thanks,
Stephen Freeland

Your project to develop houses across from the College Park east development is great for Los Alamitos at the expense of College Park east residents. Our home in College Park east has probably already decreased in value as a result of just the mere announcement of your project. My wife and I are considering moving because we know how much traffic will get worse going up and down Lampson. Adding thousands of additional drivers with only Lampson to convey them to where they want to go is dangerous and unacceptable. Lampson is already dangerous – I can't imagine how many more souls will lose their lives after you and Los Alamitos are done adding to the traffic.

17-165

This is a perfect example of one group of individuals profiting on the backs of another group of individuals.

If you want to develop housing across from Lampson, figure out a way to create an entirely new boulevard that somehow parallels Lampson to handle the traffic for you new community.

We already have aircraft overflights from the military base and constant freeway construction to deal with, but we knew about that when we bought. Now we have to handle a greedy neighboring community as well.

What are you thinking?! Build new office buildings or expand Arbor Park with maybe 20 units of new housing! This shouldn't be a get rich opportunity for Los Alamitos.

Dear City Leaders

I am very concerned about the negative impact that the proposed housing development on Lampson Avenue will have on our community. Specifically, I am concerned about the predictable delays caused by increased traffic on Lampson Avenue, Seal Beach Blvd., and Valley View Blvd., the severe lack of adequate parking for the new residents, and the dangers associated with unprotected left turns and no new stop lights on Lampson. 17-167

Our community cannot handle such a large increase in population. Lampson already backs up every morning and afternoon. More residents will mean more cars, and longer back ups. It's also not safe to have so many people dependent on one thoroughfare. There are no alternate routes from CPE. 17-168

Additionally, there are not nearly enough parking spaces in the proposed design. That will cause residents of the new development to look for parking in College Park East, taking away spots from current residents. It will also increase pedestrian crossings on Lampson Blvd which will be dangerous. 17-169

Finally, there are several serious accidents on Lampson Ave every year. An increase in traffic will no doubt lead to an increase in car accidents. It's simply not safe to build that many new housing units in the area.

Please reject the current housing proposal. The number of units need to be significantly reduced, and parking spots need to be doubled at a minimum. 17-170

Thank you,

Brian and Mimi Cannizzaro

Subject: Lampson Housing Project
Date: Wednesday, November 2, 2022 8:19:01 AM

Hello,

My name is David Vititow and I am a long time resident of College Park East. I understand a housing project is going up where the federal building now stands across from Rose and Lampson by the Dog Park. I have several major concerns about a housing project of that size going up. 17-171

My biggest concern is parking. I have taken a look at the drawings, as well as I was at the first townhall meeting asking questions. A lot of their parking they are including garages which we all know will be used for storage and can't be constantly regulated to make sure that it is used for parking. Legally, I understand the builders are including enough parking for the residents but realistically, they are shy about 200+ parking spots, all of which will end up in College Park East. 17-172

My other big concern is traffic and accidents. I grew up in College Park East. I saw many deaths on Lampson, and I still see many accidents on Lampson. There will have to be more police stationed on Lampson to control speeding vehicles to hopefully prevent accidents. Also, there will not be any left hand turns out of the complex, forcing everyone who needs to go out towards Valley View to make a U-Turn at Heather Park, causing major traffic jams and most definitely more accidents. Or residents will speed through College Park East neighborhood instead of making a U-turn which is no safer. 17-173

I have a few other smaller concerns. I'm concerned about noise pollution while building the housing project. I'm concerned with the environment and the impact building these homes will have on the wild life in the strawberry fields directly west of the project. I'm concerned for the air pollution caused by all of the equipment building the homes. 17-174

Bottom line is, Lampson is already an extremely busy thoroughfare, and adding an extra 300-500 cars daily will make it an absolute nightmare. I think that the housing project needs to be scaled down or potentially just nixed all together. Or build a parking structure of some sort or something. I don't know what the winning idea will be for this project but I truly think this project is way too big for what this little street can handle.

Thank you for your time

David Vititow

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender johnjacobs38@gmail.com

Good evening,

I am writing to request environmental studies be done on traffic safety, parking, population, and recreation regarding the projected high-density housing development on Lampson Ave. As a homeowner in College Park East (CPE), I am concerned about the effects this development will have on the quality of life in the neighborhoods of Seal Beach, Los Alamitos, and Garden Grove. In reviewing the developer's plans for the project, I find the height of the buildings and the lack of parking, traffic signals, and recreation space unacceptable. The inadequate number of parking spots for the projected number of residents will result in the surrounding neighborhoods' streets serving as regular overflow parking. My home is on the corner of Heather and Hazelnut, across from Heather Park and I think it is safe to assume the streets surrounding the park and along the side of my house will become very crowded with parked cars regularly. In addition to the residents of this development using CPE streets for parking, evenings and Saturdays during sporting events/practices at Arbor Park will bring more people needing to park in the neighborhood and then walk across Lampson. With Lampson already being a busy street with high speeds, I am concerned that an increase in traffic and pedestrians could be a major safety issue.

17-176

I would like to request that the developer be limited in the number of units they may build and those units be restricted to two-stories, rather than three. I would also like the developer to be required to build a recreation space and increase parking to a more reasonable number to accommodate the maximum number of projected residents and their guests. Additionally, a traffic signal must be strongly considered so that residents do not need to make unnecessary, dangerous u-turns at Heather Ave. and Rose Ave. Thank you for your time!

Tom,

My name is Eric Holmes and I live in the College Park East neighborhood, right across from the proposed housing project on Lampson.

Not sure who to chat with there, but our MAIN park and playground for the kids and where we have all of our events is at Heather Park. That park cannot handle additional kids, it's small and needs to be remodeled.

I think the parents of College Park East would be much more receptive if there was some agreement to split the remodel of that park with the city of Seal Beach.

I've CC'd Jill Ingram on this email as well.

I have started the Seal Beach Playground association and have over 100 members that can help plan. All of whom live in CPE.

Let me know how I can help facilitate this.

Thanks!
Eric Holmes

"toliver@cityoflosalamitos.org" <toliver@cityoflosalamitos.org>

Dear Mr Les Johnson:

Thanks first off to you and your design team for taking the time out to show the communities the plan this past Wednesday night at Ayres Hotel.

I am a CPE resident who resides close to the project as I live in this over 1700 home tract since 1988 with my husband (who are now adults). I know the project is proposed to lay on Los Alamitos property at the old West Ed property. Anyhow since the land behind it is federal property and leased to the City of Seal Beach I think it's valid that you listen to what we have to say as well as anyone living in the city of Los Alamitos because it affects us all. It also will affect Rossmoor, Cypress, and Garden Grove.
My comments are as follows:

1. Arbor Park has always only had one way in and one way out. Looking at the map from Alan the architect it shows that there are a few open walkways right into Arbor Park. This is not allowed legally because I have told it's federal land. It is opened at the main gate near Heather St in the daytime by a Seal Beach official and at night it's always closed by a federal rep. At dusk it's always closed for the night. No one is allowed in Arbor Park per the Army Corp of Engineers I have been told.

17-180

2. The parking in Arbor Park has and always will be full as soon as there is soccer or dog park people. This clashes often and that is when there are well over 200 parking spaces that West Ed allowed people to park since a very long time ago. It was always practice to allow it because you can see clearly if you go to Arbor Park how quickly it gets filled. We need better parking at Arbor if this is truly going to be a project that helps communities get on that field at Arbor Park.

3. I think it's fine that there are two parks within the complex that helps the people who will be living there but Arbor Park is where their kids will be playing at most often because it's wide open.

4. Parking spaces that the architect showed me isn't sufficient for the project. Originally in the April 11th conceptual plan it shows 580 spaces and then in the current one they showed us it said 556 spaces. Why? These spaces are still insufficient and as we all know there will be more needed for the apartments. This was proven when there was a fight for LA Fitness to not be next to a complex in Rossmoor. Those condos were originally with one parking space but then that changed when people had two cars. Then they parked the overflow at the shopping center on the other side of the building because they had no other parking. You see what I mean by you need to think about parking within your complex better. Anyhow even if there are parking spaces added that still means there was work to be done to help Arbor Park itself.

17-181

5. Concerning the left turn lane at large, main entrance, I can't believe one believes that it's the best way to move the flow of traffic to a lane that at certain points of the day will clog up Lampson. How do you propose the safety too for that when cars clog the left lane on Lampson? That's not the stagnant lane..it's the passing lane! Since there is no third lane on Lampson this makes it difficult to move approximately 500 cars a day into and out of that complex without causing destruction. Stop lights will also create a cluster btw. This is proven at every stop light we currently have just coming out of our over 1700 home tract.

I have indicated key parts in this letter and I know I will have more questions but for now this is it. Thanks for reading.

Hi,

My wife, my 3 young kids, and myself are residents of College Park East, Seal Beach and we feel the proposed development on Lampson Ave. has some major concerns that haven't been addressed:

Lack of parking for the proposed community:

Resulting in 250-plus cars parked in our neighborhood every night:
Garage parking is used for storage and not parking
Parking at Arbor Park will be impacted (Dog park/AYSO soccer). Parking will be used by residents during the day.
Vehicles will park all around Heather Park, which will limit parking for visitors.

17-183

Impact on Heather Park:

Only 14,000 sq feet of open meeting space with no play structure
Residents will be crossing Lampson Ave. to walk to Heather Park which will be a safety hazard.
Heather park is already overused and in terrible shape.
Impact on tennis courts.

17-184

Traffic Safety on Lampson:

Lampson Ave. does not have street parking and a sidewalk on one side of the road.
Vehicles will all have to make right turns when leaving the development, significantly increasing U-turns and cut-through traffic at Heather Dr.
There have been many serious and fatal traffic collisions on Lampson, which will increase.
Limited visibility when residents exit CPE onto Lampson Ave. will cause more collisions.
Lack of visibility for vehicles approaching U-turns at intersections.
There is not enough room to make U-turns at Heather Dr. and Lampson, resulting in 3-point turns.

17-185

Other concerns:

Children's safety
Heather Park is the main pick up and drop off stop for the school buses, the increased traffic will create additional hazards when the busses are stopped with red lights flashing
Water runoff (flooding)
Lampson Ave floods easily during storms and additional housing and construction will cause additional flooding
Utilities (internet, electricity, sewer)
CPE already has spotty internet with the Military Base Interference, more users will cause more disruptions and impact service
Police Response

The planned Community is under the City of Los Alamitos, however, Seal Beach will be heavily utilized/impacted for accidents on Lampson or called for additional issues (ie parking or disturbance issues) in CPE
Density of project.
In the affordable housing: 1 bedroom can house 1-3 people
2 bedrooms can house 3-5 people
3 bedrooms can house 4-7 people

Thank you for your consideration and look forward to hearing how these issues may be resolved if the project moves forward.

Jeff Tilson

I am writing to express my opposition to the so called Lampson Project. I am a resident of College Park East which will be directly impacted by this development. The following is a list of items which concern me about this project. 17-187

- Construction Noise and road closures.
- Fire / Police / Emergency Response.
- Increased traffic on Lampson and parking in our neighborhood.
- Increased population.
- Traffic Safety (u-turns at Heather, left / right turns at Seal Beach Blvd and Valley View, cars cutting though our neighborhood, etc)
- Utilities & Service Systems.
- Impact on local shopping and services with the additional residents.
- Safety of children in the street.
- Impact on local parks and city services.
- on AYSO at Arbor Park. 17-188

The traffic in this area has already been impacted in the last 20 years with the expansion of Rossmoor Center and addition of another site for this development. 17-189

Respectfully,

Joe Croce

Good afternoon,

I'm a resident of College Park East and am writing to express my concern about the new proposed housing development on Lampson. I hope that the city will not allow the approval of the development. This development will overpopulate Lampson/CPE area and cause overflow parking in our neighborhood. Not to mention make traffic a nightmare on Lampson. We already have traffic on Lampson and many fatal accidents. My family has lived here 10 years and our kids play AYSO soccer at that park every year. PLEASE don't approve the plans to move forward.

This project is wrong on so many levels. First was Los Al city council was quoted as saying they were completely blindsided by this. What? A piece of property that size and the sale passes through without them being notified just seems wrong to me either legally or certainly ethically. However, getting to specifics regarding the Environmental Impact Report : 17-191

1) **Everyone I'm sure mentions traffic and they should They like so many in CPE have only one exit….Lampson. The street would need to be widened.** 17-192

2) **The multiuse soccer fields which has as many as 7 youth soccer games uses the current parking lot regularly. The existing parking isn't enough. All of the many events would require an enormous amount of parking IN College Park East by youth sports games for game day as well as practice. Softball and baseball is also using that facility and parking is a problem NOW. This new project would practically eliminate ALL of the sports programs that use that facility.** 17-193

3) **Parking would REGULARLY be used by the new residents in CPE. Traffic lights for the congestion would be needed for the excess cars and pedestrians who will be parking regularly in CPE.** 17-194

4) **With the addition of hundreds of cars parking in CPE comes the** 17-195

inevitable rise in crime with car break ins. Car break ins in CPE has been on the rise the last few years. IT would explode if this project gores through

17-195 (CONT.)

5) **Air quality CLEARLY will be harmed by a massive increase in traffic**

6) **Noise pollution will also be off the charts too**

17-196

7) **All of the CPE parks especially Heather park will be used excessively. Waiting an hour sometimes to play tennis at Heather park will now turn into 3 or 4 hour wait to play.**

17-197

8) **I am concerned about how this will work for the Los Alamitos police department. It is a long out of the way place to patrol.**

17-198

9) **Local schools will also be impacted too with larger classroom sizes. Children undoubtedly crossing Lampson for bus pickups will be unsafe as Lampson is like a 50 MPH highway.**

17-199

IF I can think of more, I will This was just off the top of my head.

Tom Power

IRONSCALES finds this email suspicious! We know Cathy Mathews by name, but the email was sent from an unfamiliar address cchen20002@gmail.com | Know this sender?

To City of SB,

I am a resident of Old Ranch and have lived in SB for the last 25 year. I am very concerned about the congestion and pollution on Lampson that this project will bring. I drive a few times daily on Lampson to head towards GG. The sheer amount of congestion and cars on that street will create a backlog of traffic. It is only a two lane road on each side and that stretch of road is notorious for accidents as it is without the various turn outs. It isn't dubbed death alley for no reason. There was just a serious accident there last month. 17-200

The number of cars on the road will add to the pollution , noise, traffic not to mention the overall safety of its location at the end of the base runway.
It is completely irresponsible to place homes there. In addition to safety let's talk about the number of overflow of cars into CPE street parking as well as people crossing the street. Again another safety issue. 17-201

I understand there is a need for affordable housing but that is NOT the place. It will forever change the small town feel that is what makes this town unique. I am not opposed to housing just not high density housing. In addition, I understand there is a plan to include affordable housing. Nothing in SB will be affordable. As soon as those units go up the prices will go up and the people that really want/need affordable housing will be soon priced out. There will be no system in place to stop the neighboring residence to get their friends and family to purchase those homes using some creative ways. Again it does not serve the purpose. Please listen to the residence of SB and do not approve this. 17-202

Sincerely,
Pin Chen

Please stop the Lampson Project!

As a resident of College Park East, I can tell you that the impact on the noise of additional traffic, the increased danger of driving on Lampson due to higher volume of motorists, not to mention the impact on air quality, will truly be felt and detrimental to those of us who reside here. We already deal with the consequences of being bordered by the freeway, but adding ANOTHER border of traffic, noise and pollution is ridiculous and preventable.

I urge you to oppose this project for the health and well being of all of us in College Park East.

Thank you,
Karole Chesser

Hello City Council Members and City Planners,

I am urging you to stop the lampson project!
When my family and I moved to College Park East neighborhood, 8 years ago, we were so excited to have a safe, calm & quiet neighborhood for our young kids to grow up in and enjoy. The lampson project will do the opposite for this atmosphere in our neighborhood! 17-204

The construction and noise that will be added to the neighborhood for the next few years will not only be a nuisance but an overload! We have already endured years of construction going on with the 405 revamp project. This will just add to the noise, dust, dirt and rodent problem that we have already been experiencing for the last few years! It has been awful and I can't imagine MORE of it!! 17-205

The other thing that I worry about is the increase in cars and traffic not only on lampson but in our neighborhood of College Park East! There are so many children that live in this neighborhood that are constantly riding bikes, skateboards, enjoying the parks & outdoors with their friends, and now they will have to worry about an increase in traffic the neighborhood. This is very worrisome!
The increase in traffic on lampson will also be extreme! Going in and out of the CPE neighborhood at Heather Park and Rose Street. As well as cut through traffic in College Park East. 17-206

Our home backs up to lampson, we are directly across from a portion of the golf course at Old Ranch Country Club. We are at 4161 Ironwood Ave. and there is already a high amount of traffic noise on lampson and this will only make it worse. Not too mention many accidents that happen along this stretch of the road due to speeding cars down lampson. 17-207

This housing project will also contribute to overpopulation in this area! College Park East neighborhood is already densely populated. With surrounding neighborhoods such as Westgate, Garden Grove, Rossmoor, we don't need to add to the congestion and amount of people in this area! Please don't crowd us out!!!

Just to name a few and reiterate these issues of major concern. Highly populated, dense neighborhoods, increase in traffic and traffic issues, unsafe conditions for our children- in recreational parks, neighborhoods and in the streets and traffic. An increase in noise and air pollution! Construction issues added to what we already have going on with the 405 revamp project, including dirt, dust and rodent infestations!
Please help keep our families and children safe and DO NOT continue with the lampson project! 17-208

THANK YOU,
CONCERNED RESIDENT OF SEAL BEACH COLLEGE PARK EAST NEIGHBORHOOD,
AMY REID

Los Al and Seal Beach Council Members,

I write this E-mail in regard to the Lampson Project Development In Los Alamitos, CA. Where do I begin?

The fact that a development with so many dwelling units has been considered by the city of Los Al is not only unacceptable, but borderline unethical. I have been in construction for quite some time and I have never seen anything like this for an area we live in. How did this even get this far? The negative effects this project will have outweigh the benefits by a landslide. I am not sure who is getting kickbacks (city of Los Al), and I really do not care, but this project is not a good idea. THIS PROJECT SHOULD NOT BE APPROVED.

17-209

Negative Side Effects

- Increased and overwhelming traffic
- U-Turn being forced at Heater park on an already dangerous/blind turn where you can;t determine the speed of upcoming traffic
- Not even close to ample parking (under served)
- College Park East (Seal beach) will have cars parked in the are from this development
- Parks in College Park East over crowded

17-210

City of Seal Beach Council Members, I am surprised that you are not fighting this (except Schelly who might be). Would you approve this if it was in Old Town or The Hill?

City of Los Al Council Members, You are turning a blind eye to your neighbors and this is not right. You all know this development should not be moving forward, but whatever kickback the city of Los Al is getting shows how unethical this is. Would you be moving forward with this project if you did not get this kick back?

You need to put a stop to this immediately.

17-211

Best Regards,

Bobby Papoulias

Seal Beach, CA 90740

Greetings Mr. Oliver,

My name is Owen Kupfer, a recent homeowner and resident of College Park East for over 30 years. I grew up in Seal Beach and have seen the many changes our little city has faced, many good and some outright deceitful. The Lampson project proposed sits squarely in the latter. I viamently oppose the development at 4665 Lampson Ave. Im sure you have received many letters and comments so i wont run through the ways this proposal will consume our peaceful neighborhood. The thing is, my previous profession involved working closely along side real estate developers and although i loved my job, i got to see these projects behind the vail. Along side my overall assesment, after reviewing the details of this expansion and using statistical software, the outcome is unsatisfactory. I emplore you to seek an unbiasd review and/or full assesment of the proposal, it will open your eyes to the havoc these atypical developments cause long term. I thank you for your time and attention, this matter is consequential to me and envokes the passion of many of my neighbors.
Respectfully,
Owen Kupfer

As a resident of College Park East (4572 Hazelnut Ave.) we have numerous concerns regarding the proposed Lampson Project at the West Ed site. Beyond the obvious concerns of more traffic and more air/noise pollution, we have objections to this project as proposed because of the following:

17-213

* limited parking in the development which could negatively affect parking in our neighborhood
* lack of parks/recreation area
* impact of more students in our schools which will cause overcrowding
* already strained resources of emergency service providers-fire, medical, and police
* construction-specifically the impact of large trucks and equipment on Lampson; the noise that we would have to endure during construction; the movement of vermin to our neighborhood as a result of construction; impact on animals who already live in the area
* 3-story buildings which will limit privacy and aesthetics to our one and 2-story homes across the street
* impact of water usage as well as impact on water quality during construction

17-214

We expect the Enironmental Impact Report to address our concerns along with any others we may have failed to mention. We respectfully ask that the developer seriously consider our concerns as we have endured the construction of the 405 Fwy expansion and now this proposed development that we object to as it will negatively impact our daily life.

17-215

Hello,

I would like to voice my concerns regarding the new housing development on Lampson Ave.

Our City and infrastructure is not able to support this new housing development. Our School District, Police Dept., Hospital, Community will all be impacted negatively with this new development. Currently we face water restrictions and flex alerts oh hot days from our electric company. This new housing development will only make everything worst.

The City should instead use this land to create a park. A new park with a community pool or community splash pad for the Residents of Los Alamitos.

Thank you
Elizabeth Cortez
Concerned Los Alamitos Resident

Good evening,

I am writing to express my concern over the projected high-density housing development on Lampson Ave. As a resident of College Park East (CPE), I worry about the affects this development will have on the quality of life in the surrounding neighborhoods. Among other things, my primary concern is regarding traffic, parking, and safety. I have reviewed the plans made available by the developer and find the lack of parking, traffic signals, and recreation space completely unacceptable. My home is on the corner of Heather and Hazelnut, across from Heather Park. The insufficient number of parking spots for the probable number of residents will inevitably result in the surrounding neighborhoods' streets serving as regular overflow parking as there is no parking on Lampson Ave. This is unacceptable and will result in traffic congestion and safety issues. In addition to the residents of this development using CPE streets for parking, people attending sporting events/practices at Arbor Park will also have to park in the neighborhood and cross Lampson. Lampson is already a busy thoroughfare with motorist driving too fast around blind curves. An increase of up to 800+ more residents in the area will only increase traffic and my fear is that with an increased number of people, mostly children, crossing Lampson there is a high likelihood of tragic accidents.

I would like to respectfully request environmental studies be done on traffic safety, parking, population, and recreation before plans go any further. Thank you for your time!

We live in the College Park East neighborhood, and we are opposing what is to be planned on Lampson Ave.

The traffic on Lampson Ave is difficult at peak times of the day. We cannot imagine how it will improve by adding additional housing along that street. Lampson will become a very busy street not just during peak hours, but during all hours.

Julia and James Shores...4833 Fir Ave., SB

17-218

From: Karen Kupfer
To: Tom Oliver
Cc: Owen Mister Kupfer
Subject: Lampson Project
Date: Tuesday, November 1, 2022 5:14:37 PM

Mr. Oliver:

I would like to express my concerns about the proposed Development on Lampson between Rose and Heather. My biggest concerns are about the traffic. I don't believe Lampson can support the additional traffic and the added traffic on the 405 freeway access will be extreme, considering how dangerous the northbound onramp is currently. Also, the plans are not adequate for the traffic coming in and out of the project. 17-219

I am also extremely concerned about the schools. The local elementary, middle schools and High School are at or near capacity. Where will all these additional children go and what are the plans to accommodate them? 17-220

Finally, what is the plan for emergency ingress and egress? Lampson will not be able to support a mass evacuation.

The scope of the project appears to be too large, too dense and not well thought out. 17-221
Thank you.

Owen E. Kupfer, Jr.
4380 Candleberry Ave.
Seal Beach, CA 90740

From: Karen Kupfer
To: Tom Oliver
Subject: Lampson Project
Date: Tuesday, November 1, 2022 4:27:08 PM

I am writing to express my concerns about the proposed housing project on Lampson at the old West Ed site.

Primarily I am concerned about the additional traffic of a project this size. I believe the project is simply too big in scope.
Since traffic will only be able to turn right out of the complex, the added traffic will either proceed to Lampson and Seal Beach Blvd. (already really crowded) or cut through College Park East residential neighborhoods to get out of the area.

Additionally, no large trucks (construction) are currently allowed on Lampson. How will the project be constructed? If a waiver is allowed for the construction trucks, who will be responsible for repairing Lampson after the project is complete? Since the project is in Los Alamitos, but Lampson and the area directly effected is Seal Beach, how will that be resolved.

17-222

Also, what about in case of an emergency. Large fire, earthquake, etc. Only one way out appears to be a safety hazard. I believe some other route must be provided for getting in and out of this project. Perhaps a route that winds its way along the eastern border and empties onto Orangewood or somewhere in Eastgate; west Garden Grove.

17-223

Another issue: If 3 story apartments are suitable for this project, why not place them at the back of the project, near the Naval Base, overlooking the new homes they are building, vs. overlooking the homes in College Park East. If 3 stories is appropriate, then why not keep it in Los Alamitos instead of effecting Seal Beach, College Park East.

17-224

Why not include a park with equipment for children in this project? College Park East was built with several community parks; one of the selling features of our community. With not place for the residents of this proposed project to gather, play, etc., it is likely that our neighborhood/community parks will be overrun. Again, this project is Los Alamitos and our parks are Seal Beach. Will there be some sort of compensation to Seal Beach for park upkeep and maintenance?

Basically, I strongly believe that this project is too large, as proposed, and should be reduced/modified to make it more feasible.

17-225

Thank you.
Karen Kupfer

As a resident of College Park East, I have serious concerns over the proposed project to build 240 or more housing units along Lampson Avenue. My concerns are as follows:

- The project does not provide adequate parking, which will result in overflow parking in College Park East;
- The additional cars from the new units will seriously add to congestion, impeding fire, police and medical responses
- Additional cars and project construction will adversely affect air quality and create noise pollution for existing residents along Lampson;
- Traffic congestion will undoubtedly increase along Lampson, particularly since drivers from the Project can only make a right turn onto Lampson and will have to make u-turns near Heather Park to go toward Valley View;
- Neighborhood k-12 schools will be impacted, since the project does not call for new school construction.

Thank you, for responding and I realize you have possibly no answers at this time. But do you know anything you can share regarding the timeline the possible possibility of this going thru? Where do we go to share our concerns or are you the person? I understand there a meeting on the 16th, correct? Is there proposal for another entrance or street to alleviate the impact on Lampson? Maybe one that will filter in and out through Los Alamitos somehow?

17-227

Just some thoughts.

Thank you again,
Karen Iwakoshi

Hello,

I live in College Park East, looking at the big picture here and thinking what the heck do you think this is going to do to the traffic in this area??? We are very impacted now have you driven on Seal Beach Blvd to Lampson and Valley View almost a parking lot can you even imagine what this will do adding so many more dwellings? The long term effect on the over all environment of the area is key here we live here because of the area and this will impact this area tremendously and if you find that the EIR shows otherwise I'd be surprised? The TRAFFIC alone has to be the worst part of this plan.

PLEASE make other arrangements I fear that money for this is the only reason to make this happen at the cost of homeowner just right across the street who has lives here for years and raised their families. This will impact them/us 100 fold and no consideration to them/us!

What can we do to encourage or stop this wrecking ball from happening?

Thank you for some or any consideration,

Karen Iwakoshi

4665 Lampson Avenue development project

Hello, my name is Anjanette Kupfer. I am a homeowner in College Park East and reside with my husband, young child and dog. Our home backs up to Lampson Avenue and is directly across from your proposed development/Apartment buildings. My husband and I both grew up in Seal Beach/College Park East and have fond memories of our wonderful neighborhoods. College Park East is an ideal neighborhood for families, elderly and retirees because of its beautiful, safe and peaceful environment. I am strongly opposed to the proposed housing development at 4665 Lampson Avenue because of the negative impact it will have on our environment, neighborhoods and surrounding cities. 17-230

We currently have a beautiful Unobstructed view from our backyard of mountains, trees and wildlife with calming sounds of nature from the animals, birds and critters that live in the parks and military base along Lampson Avenue. This beautiful view may soon be replaced with your housing development consisting of 77unit three-story high apartment buildings, 114 townhomes, 55 cluster homes and parking lots filled over Max capacity with cars, trucks, school buses and motorcycles. This will cause excessive noise, bright lights, mass traffic, toxic pollution and extreme amounts overcrowding to College Park East and its surrounding cities. Although this is very concerning for me, my main concern is for the protection of our environment and for the wellbeing and safety of our community. 17-231

I understand the need for more housing in Los Alamitos/CA, however bringing this development to 4665 Lampson Avenue will have devastating effects on College Park East and its surrounding cities. As you may already know we have a very unique situation where Lampson Avenue connects College Park East, Los Alamitos, Seal Beach and West Garden Grove all within a few blocks of each other. I believe we already deal with a great amount of traffic, noise, pollution and overcrowding in this small area. Your development will cripple our community and roads. Creating many safty, and environmental issues. Your development will also decrease property values and destroy quality of life for people and animals in this area. 17-232

Your proposed development will create a very noisy environment. It will create noise from hundreds of vehicles pulling in and out of the development and driving up and down Lampson Avenue throughout the day and night. College Park East currently has an inadequate, outdated sound wall that is not tall enough or strong enough to absorb this new mass amount of noise created by this traffic. Residents' sleep and quality of life will suffer immensely. This noise will also affect our pets and wildlife that live outside. These loud noises will create anxiety, restlessness and frustration for them. 17-233

Your development will be built right out to the edge of Lampson Avenue. Loud noise from people going in and out of their cars, homes, and socializing will cause loud echoing noises into the neighborhoods of College Park East. I would like to insist that a sound study is conducted for the entire street of Lampson Avenue to show the effects it will have on the residents that live along this street.

Will there be a school bus picking up children in front of your development? School buses can be very loud from the sounds of their engines, exhaust and brakes. This will create a large amount of noise pollution. People living in College Park East, especially those living in the homes that back up to Lampson Avenue will be disrupted by loud voices of children getting on and off the bus and the loud noise from the bus itself. Please consider this and how it will affect College Park East residents. If there is no school bus in front of your development this would mean the kids might have to cross over Lampson to catch the bus? This could be very dangerous for them or may require a crossing guard. Which would add extra noise and more traffic in College Park East.

17-234

Noise from your development will also negatively Affect birds, animals, reptiles and critters that reside in the military base and parks nearby. Added noise from traffic, people socializing, children playing and heavy Equipment could deplete our wildlife. In a panic these animals will run to the nearest neighborhood/parks looking for safety and refuge. While crossing over Lampson Avenue they can be hit by cars or cause car accidents. What will you do to prevent this situation? Please do a study on how this noise will affect the wildlife and their habitats. It is important that we preserve the small amount of nature and wildlife that we have left in our cities and on this earth!

Noise from your development can also negatively affect children and adults with autism or other special needs who are highly sensitive to sound. Many of these people have chosen to reside in College Park East because of its calm and quiet neighborhoods which are required for their health and wellbeing. Please consider your special needs neighbors before any further development is pursued. Please do a research study on how loud noises from traffic,construction and overcrowding can interrupt the health & wellbeing of our special needs friends.

17-235

College Park East residents already have heightened stress from having to endure the extreme noises from fighter jets, military vehicles, police helicopters training, traffic on Lampson Avenue and the echoing sounds from the freeway and Disneyland fireworks. Adding noise from years of heavy equipment to construct your development will cause extreme amounts of stress, anxiety and depression to people living and working from home in College Park East. Please do a research study on how much added noise there will be and how it will affect the residence quality of life in College Park East.

17-236

On the weekends AYSO plays soccer games in Arbor Park. Currently there is not enough parking for the AYSO and Arbor Park visitors, so they fill up the West Ed parking lot. If they no longer have access to this parking lot due to your development then where will they park? Even if there are 50 more spots added to Arbor park it would still not be enough. I believe these guests would be forced to park in the neighborhoods of College Park East. This would create a lot of added noise from people Parking in front of our homes,unloading their cars and gear, and talking right outside our windows. The added noise from AYSO parking in front of our homes will disrupt the quality of life for our residents and interrupt people trying to rest on the weekends.

17-237

How will this be prevented? More cars driving through College Park East equals more pollution, affecting our breathing, affecting nature and negatively affecting aesthetics bringing down our property values. How will you prevent this? Please conduct a study on how much parking is needed for all park patrons and AYSO guests. Also please conduct a study on how this added air pollution will affect the residence and property values in College Park East.

17-237 (CONT.)

Currently it does not look like you have enough parking for all your residents, their teenage drivers, their caretakers, their visitors & their public transportation. Parking will be a very big problem. How do you plan to enforce your parking? If there is not enough parking for your residents they will park in front of College Park East homes. We will then have to hear cars pulling up, people getting out of their cars, people talking on their cell phones and people talking to their children morning noon and night, disrupting our quiet peaceful neighborhood and ruining the quality of our lives.

17-238

Lighting from your development will also be a major concern for the community of College Park East and for the environment/wildlife. Lights from your three story apartments,cluster homes, townhomes, vehicles and parking structures will cause major light to shine. These lights will shine into nearby homes, trees, and areas where animals reside. This bright light will distract drivers. disrupt sleep and confuse animals. Animals will begin looking for food sources where it is now visible, endangering civilians. The light will also attract tons of insects from the base and they will die from exhaustion while fluttering around light sources. Our current sound wall is short and outdated and will not block the light from your development. These bright lights will take away from the beautiful and peaceful view of nature replacing it with bright lights from three story apartment buildings, cluster homes and townhomes. This development will be an eyesore taking away from the natural landscape that gives our properties value. How will you prevent our property values and quality of life from going down? How will you prevent the dangers that this light will cause to animals and humans? I'm requesting the 3-D renderings of how this development will look from the College Park East backyards from Heather to Rose street. I would like a daytime and nighttime model done for all residents who back up to Lampson Avenue in College Park East between these streets..

17-239

The light that will reflect into the trees and bushes will also affect wildlife. This light may cause confusion to animals and causes animals to wander out of their natural habitat into the neighborhoods of College Park East to find new homes. This could be very dangerous to children and to people living in College Park East. Please let me know how you plan to prevent this. Please do a full study on the impacts these lights will have on our wildlife.

I would also like to have a shade study Analysis done. How much light will be blocked by these oversized apartment buildings? Will there be solar panels on your homes/apartment to help with California's energy crisis? Too much shade could prevent trees and nature from growing properly and creating muddy grassy areas. Again this will affect nature and quality of life for humans and wildlife.

17-240

I am also concerned that there is no traffic light being put in. This will push all the cars to go West towards Heather Street. Then they will have to make a U-turn to go east towards Garden Grove. This could be very dangerous and cause many accidents. There are many children that ride their bikes near this intersection. How will you prevent accidents and congestion? Will a traffic light be put in? Please conduct a traffic study on how this will affect traffic throughout the day and night along Lampson Ave. All College Park East residents must take a Lampson to exit for school, work, shopping and emergencies . No traffic light and more traffic will create overcrowding, accidents, frustration and tardiness. How will you prevent this?

17-241

Pollution is another Environmental hazard that will affect College Park East and its Neighboring cities. We already suffer from pollution from airplanes, fighter jets, military vehicles, police helicopters, school buses and traffic. Lampson Avenue links three cities in a very small proximity. More pollution from your construction and vehicles will have major effects on these cities. My son has severe allergies to dust. The Dust and fumes created by your construction and heavy equipment can be extremely dangerous for him causing severe illness or hospitalization. There are also many people with compromised immune systems and weak respiratory systems who reside in College Park East. Adding toxic pollution from vehicles and construction can be life-threatening to them.. It can also shorten the lives of animals, birds and trees that live nearby. Pollution will also be released into the air if you cut down trees. How many trees will be cut down? This is an environmental emergency that can be prevented by not putting your housing development in this unappropriate area. Please conduct a study to see how this added pollution will affect the cities of College Park, Los Alamitos, SealBeach, Rossmoor and Garden Grove.

17-242

In your proposed development there are no playgrounds, no shopping centers, no grocery stores, no walking paths, no library's, no business centers, no pools, no tennis courts, no golf courses and no public transportation hubs. Where do you predict your residence to go for these needs? Your lack of resources will put extreme pressure on College Park East, Seal Beach, Rossmoore and West Garden Grove to provide recreation and basic needs for your residence. Our roads, parks, playgrounds, and sidewalks cannot handle this amount of overcrowding and will suffer from extreme wear and tear. What city will pay for the damages caused to our community's resources? This is a very delicate situation. Adding housing for one group of people will hurt the quality of life and resources for another group of people. The huge amount of negative effects that your housing development will bring to College Park East and its surrounding cities/environment will outweigh the small amount of positivity it will bring to Los Alamitos. There needs to be a balance between your development and our communities . We need to protect the environment and the people who already live in these cities. I don't see compromise helping due to your lack of parking and resources. Please find a new more appropriate location for your poorly planned project.

17-243

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender chrisheble@gmail.com

Mr. Oliver,

I wanted to voice my family's concerns about the Lampson project. I will be as brief as possible as I'm sure you will be getting many emails about this.

The obvious concern is traffic and parking. To have possibly a thousand people housed in such a compact space is very concerning. If I have the numbers correct 557 parking spaces for 246 homes. The biggest concern would be the 77 affordable multi family homes with only 98 parking spaces. How do you see this working? Even if these are mostly one bedroom units there would obviously be many with couples living there. Larger units could house four or five people. Even if the families have small children those children will quickly grow up and be driving. That could easily mean that the affordable housing would need more than twice as many parking spaces than is planned. Without enough spaces those residents will come to College Park East to park. There is not enough parking already on Ironwood and I can see Heather being inundated with unwanted cars. That's just the affordable housing. The same problem to a lesser extent will be true of the rest of the residences. There is no way that there is enough parking for this project. 17-244

I realize that the more housing that is planned the more motivated investors will be and more taxes will be paid. It is a money maker for the developer and the city and the state and housing is at a premium right now. With that said, building 35 ft tall buildings close to Lampson- because you'll have to build close to the street in order to fit that many units on the property, means that they will over look the houses and yards directly across Lampson in College Park East. So not only will we feel crowded because of traffic and parking we will literally feel eyes on us anytime we go into our yards. 17-245

Probably the most important issue will be safety. Lampson is a dangerous thoroughfare running parallel to the 405 freeway. Not more than a few weeks ago a driver was killed on Lampson. I have only lived in this area for four years and I personally have seen 5 major accidents on Lampson. When you double or triple the traffic on this four lane road it will only get worse. 17-246

There are other issues- Where will the Soccer families park, where will the dog park people park- I assume that these current parking spaces behind the property will be prime targets for the new residents for the necessary overflow of cars that haven't been planned into the development. The impact of parking and use of the College Park East parks and green spaces is also a concern. The new residents will obviously cross the street to use our tennis courts, playgrounds and parks because the green space and parks in the new development will not be sufficient for as many residences that have been planned.

This is a terrible idea for all of College Park East. It's just too many people squeezed into too small of an area. Keep the feel and zoning of the area that already exists for your development rather than shoe horning as many cubicles as possible into the space. We are a great neighborhood of single family homes with some "more affordable" condos at one end. This development will destroy what was the reason most of us moved into College Park East. Its a neighborhood, not a hive. 17-247

Thank you for your time and consideration,

Chris Eble

Subject: Lampson Project Comments - 4665 Lampson
Date: Tuesday, November 1, 2022 10:33:22 PM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender christopherderry@yahoo.com

As a 25 year resident of College Park East in Seal Beach I have some serious concerns about the proposed high density housing project at 4665 Lampson.

1. At first glance, 246 housing units and 500 plus people and all of their cars crammed into 12.3 acres seems ridiculous. It feels like cruel and unusual punishment to those who would live in the new development, and those who live near it. 17-248

2. Ingress and egress for the 500 plus residents into and out of the project would be onto Lampson Ave at uncontrolled intersections. Many drivers travel on Lampson at freeway speeds and safety would be a real issue. 17-249

3. Where is the open space/park/recreational area for the residents of the project? 17-250

4. Where is the parking for guests of the project's residents? 17-251

5. What exactly does "Affordable" housing mean? I think many of our area's residents have concerns about what that term means and would be opposed to subsidized housing. 17-252

6. How much will demolition and construction affect those of us who live near the site? Will Lampson, our only artery to the outside world, be torn up and blocked again? If so, for how long? The constant parade of trucks and construction equipment, noise, and disruption to the quiet surrounding neighborhoods will be painful. 17-253

7. The purpose of zoning and urban planning is to segregate incompatible use of land, to prevent new development from interfering with existing uses and to preserve the character of a community. The character of the community surrounding this project is a quiet, bedroom community of single family homes. The developer should have to create a project within the existing zoning. The city should not change the zoning to fit what a developer wants to do. This project is incompatible with the surrounding community. 17-254

8. This project will have a direct negative impact on College Park East in the form of construction noise, pollution, road closures, increased traffic, increased parking issues, increased use of Heather Park, increased crime, and lowered property values.

For the above reasons, I oppose the development of this project as it is currently planned, and you should too. 17-255

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender josburn@triplelift.com

Hello Los Alamitos City Officials,

I am writing you this email to inform you of my concerns and disagreement with the project on Lampson, located at the current California Department of Fish and Wildlife building. I'm a homeowner who lives very close by in the College Park East neighborhood in Seal Beach and this will negatively impact the well being of my family. 17-256

I understand the desire to create affordable housing, but I don't think this is the proper location to construct such a massive project, for the following reasons:

- **Traffic Safety**: Lampson St. is already very crowded with many cars, lots of traffic and not to mention, accidents. Adding a 240+ housing development will only make this worse, with additional cars flooding into other parallel streets, causing danger to kids who play in the neighborhood and pedestrians. Traffic is also pushed one way, which will force users to make u turns at Heather Park, where many children currently play and walk around surrounding areas as pedestrians. 17-257
- **Air Quality**: will also be affected as a result of the increased traffic and cars. We already have enough issues with air quality with the various helicopters and planes roaming the area from the base. 17-258
- **Noise pollution**: The area already has enough noise coming from the 405 and 22 freeways, adding more traffic on Lampson will only magnify this and cause issues for residents who seek peace and quiet at their residence. 17-259
- **Parks and Recreation challenges**: When College Park East was built in the late 60's, it didn't get assigned the proper amount of parks for the total size of the housing tract area. It's already crowded at our current parks and with no parks in this project, this will only make things worse and decrease the quality of life for kids that live in this neighborhood (such as my daughter) with kids from other areas coming to overcrowd the parks. 17-260
- **Parking**: With limited parking in the housing project, this will in turn create issues and an overflow of people parking cars in the surrounding neighborhoods. College Park East already has limited parking. 17-261
- **Fire/Police/Medical Response**: with ongoing labor shortages and adding more people to the surrounding area, this will increase overall response time for first responders, creating more risk for current residents.

I hope you will take my concerns into consideration and appreciate your time. Please reach out with any questions. 17-262

Thanks,

To whom it may concern,

We have been residents of College Park East since 2002. This letter is to request that you stop the Lampson Project. The project is not taking into consideration many negative environmental effects on our community.

The project will not add anything to our community but will affect the quality of life for our families. Lampson is not designed to take the proposed project. It is a small street that already causes traffic issues. We moved to CPE because of its location, which is not on a main thoroughfare. Moving forward with such a project will create noise pollution and will become unsafe for our children.

Thank you for your consideration.

Regards,

Scott & Maria Melendres

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender alison.toda@yahoo.com

To the Proposed Lampson Project Developer,

As a College Park East resident in Seal Beach, I am very concerned about the many negative impacts the proposed new project will have on our community.

We already have a lot of noise from the freeway and overhead from the Joint force training base. Adding so many new houses with residents probably having at least two cars per family would increase the noise pollution level dramatically. The increased air pollution would also be detrimental to our health. In essence we would be sandwiched between the pollution from the freeway and the high density housing.

17-271

Lampson already has potholes when trucks over a certain weight are supposed to be prohibited. Adding the new housing, heavy road equipment, and all the additional cars would certainly degrade the roads even more causing more frequent road closures and repairs. This would end up costing the CPE residents more in time and money for car repairs and maintenance.

Traffic is getting worse along Seal Beach Blvd. and Valley View. Those are the two major entry roads into our neighborhood as you are aware. Adding even more commuting time just to get through Lampson sounds very frustrating. We could potentially have traffic until we literally arrive at our driveway.

17-272

Lampson has only two lanes in each direction. I'm certain cars will be cutting through the residential streets to take short cuts since the cars will be congested on Lampson. This means neighborhood children, walkers, runners, dog walkers, etc. will be more put more in harm's way with drivers rushing about. U turns will have to be made at Heather Park, which is my major cross street. That means the wait time at that light will definitely increase each time I drive back and forth to my house.

The physical safety of residents is also at stake. I've lived here a long time and seen numerous cars crash into the cinder block walls of neighbors' backyards along Lampson. There have even been fatalities due in part to the curve along the road on Lampson. An increased number of cars and traffic will increase the likelihood of this happening more often.

17-273

Since ample parking and parks are not provided for the proposed project, we are worried that cars will need to come into CPE to park . The residential streets are crowded enough. CPE parks only have a limited amount of resources: tennis courts, playground equipment, open grassy areas, etc. It will not be as enjoyable if there are too many people there. More cars and more people likely means more crime, especially if there are affordable apartment units where people are more in transitional phases.

Please take into consideration that this new project will adversely affect our quality of life in more ways than I have the time to list.

17-274

Sincerely,
Alison Toda

Hello,

I am concerned about the high density housing development being planned in Lampson Avenue. This project could negatively affect our community. Some examples are below.

17-275

Aesthetics
Air Quality
Cultural Resources
Construction Noise and road closure
Fire / Police / Medical Response
Greenhouse Gas Emissions
Hazards & Hazardous Materials
Land Use & Planning
Noise Pollution (vehicles on Lampson)
Population & Housing
Parking in our neighborhood
Public Services

Recreation, as I have toddlers who play in park and I am pregnant as well

Road impacts from heavy equipment
Rodents
Schools / Libraries
Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc)
Utilities & Service Systems
Views from our backyards

17-276

Please consider my concerns.

Thank You,
Nimfa Taylor

To Whom it May Concern,

My name is Grace Hughes and I live in College Park East. These are my questions/concerns about the lampson project: 17-277

1. As you know, there are no schools in CPE. During school drop off and pick up times, there is a lot of traffic to Rossmoor. It is already nearly impossible to take a right onto Seal Beach Blvd and a left onto St. Cloud Dr from 745am-8am. How is the developer planning to help alleviate the congestion during school drop off hours? 17-278

2. Parking - in the completed high density housing project off of Chestnut st and Sausalito St, there is never any parking. Although the developers are abiding by parking requirements, in practice, there are always more cars per unit than anticipated. How will the developer plan for overflow/guest parking? 17-279

3. During demo of the existing building, how can we make sure the air quality remains safe for families and children? 17-280

Thanks,
Grace Hughes

Hello,
I am concerned by the planned housing development on Lampson and the impacts it will have on the surrounding area.

I would like studies to be done to ensure that there is sufficient park space for the residents within the development and parking in the new development to avoid impacting College Park East and any other neighborhoods. Additionally, that area has no essential services like groceries or schools in walking distance to the planned development. I request that environmental studies be done on the increased traffic and pollution (noie and smog) that will be generated by the development to ensure that it stays within regulatory limits.

Thank you,

I am a concerned resident in opposition of this project. This project will negatively affect the neighborhood and surrounding communities. I am highly concerned about the increased traffic impact it will have on surrounding streets. We already have high traffic incidents and congestion on Seal Beach Blvd and Valley View. This project will negatively impact the traffic on surrounding streets and create a dangerous driving environment.

Not only that, but rezoning the park for residential, will take away the opportunity for hundreds of children from our community and surrounding communities use the park to play soccer and practice. It is a wonderful, inviting, and inclusive family environment. I would hate to see that taken away.

Importance: High

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender kingsvacations@hotmail.com

To whom it may concern:

My family and I have lived in College Park East for 24+ years. This project will have a negative effect to our neighborhood for many reasons .There will be many negative effects; coastal property values will be effected, construction& road closures ,public services (fire/police/medical response) , traffic - safety & noise on Lampson ,air quality & green house gas emissions , street parking in the neighborhood, pressure on the schools & parks , rodents & sanitation , just to name a few. 17-283

Effect on property values is a big issue. There are limited coastal communities, we invested in coastal property which is always at a premium, this project will have a negative impact. Low income housing does not belong in this area. This should be a consideration. 17-284

With construction road closures are always part of the formula. Lampson is a very busy street and is the only street feeds into College Park East as well as into the neighboring Garden Grove neighborhoods and into the Los Alamitos townhomes on Lampson. Definitely a foreseeable problem. 17-285

Public services such as police, fire and medical response is concerning. With increased traffic, construction road closures this will put the current residents at risk of decreased responses to potential needs. 250 homes equals at a minimum 500 more cars traveling multiple times a day on a road with very heavy traffic road. This increased traffic leads to less safety for our children and increased noise. The increased traffic also has an ill effect on air quality and green house gas emission. Street parking will then become a problem in College Park East. 17-286

With the addition of 250 home comes an increase of children, putting pressure on the schools and parks. There is already not enough parks to handle local sports for the kids (AYSO, baseball, softball, 17-287

football, Lacrosse).

The construction will also effect the sanitation of the area, pushing existing rodents, racoons & cayotes into the neighboring neighborhoods. Just to name a few concerns. This project was thrown upon us without a conversation or vote.

COMMENT CARD
4665 Lampson Avenue
Scoping Meeting
October 20, 2022

Please identify any areas of concern you may have regarding the scope and content of the 4665 Lampson Avenue Draft EIR, including any additional environmental topic areas, potential mitigation measures, or project alternatives (please print):

1. The mixed use density of 20 dwelling units is too high to accommodate adequate parking. Spill over parking onto College Park East residential streets will result. The AYSO games will be impacted and not be able to continue with limited parking. 17-288

2. Vehicle access to the project site via two driveways on Lampson is not safe. Ingress and egress are severely limited due to the greenbelt divider on Lampson. This limitation becomes a safety issue for school buses and emergency vehicles. Cars will be making U-turns at Heather and at Rose to accommodate driving on Lampson for the development. 17-289

3. Project open space area should be converted into a recreational park with playground equipment for neighborhood children. If doing so results in fewer housing units, then so be it. Without a designated play area, the Kids will be dangerously crossing Lampson via walking or biking to access Heather Park.

4. Vehicle miles travelled (VMT) will significantly increase within the development, on Lampson, Seal Beach Blvd and Valley View at a minimum. The current Park N Ride lot that supports carpooling and vanpooling will be eliminated, increasing VMT. Adding a formal telework center in the project for those living in or near the development might mitigate by giving an option to reduce their commute to work, saving mobile source emissions and ensuing mobile source air pollution. 17-290

5. California State law requires solar roof panels on new housing and zero emission electric vehicle charging infrastructure. Neither are mentioned in the proposed draft plan and are not indicated on the schematics.

6. This development should be state of the art so project and CPE residents can be proud of it! 17-291

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender shannon.r.shondeff@gmail.com

Dear Personnel:

We have recently purchased a home in Rossmoor. We are absolutely hands down against a new development and hundreds of new homes adding traffic to our daily commute to sports practices and preschool in Seal Beach.

17-292

This will negatively affect so many things in our community including but not limited to:

Aesthetics
Air Quality
Cultural Resources
Construction Noise and road closure
Fire / Police / Medical Response
Greenhouse Gas Emissions
Hazards & Hazardous Materials
Land Use & Planning
Noise Pollution (vehicles on Lampson)
Population & Housing
Parking in our neighborhood
Public Services
Recreation
Road impacts from heavy equipment
Rodents
Schools / Libraries
Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc)
Utilities & Service Systems

17-293

Our children also play soccer at Arbor Park and our family uses the dog park. This would have a huge impact on this area in all the ways described.

This area is a lovely and relatively quiet community where most households are families. Where we feel safe and it's not congested by traffic, pollution or too much housing squeezed into a small area. This is absolutely a HUGE loss to the hundreds of families already calling College Park east and the surrounding area home. Only a win for the developer.

Please listen to the residents and consider stopping this potentially devastating change to our community.

Regards,

Shannon Shondeff

Lampson Project Concern

Arbor Park is a huge part of the Seal Beach - CPE community. This project would affect current residents, parking as well as sports activities. The affected sports activities would be felt in multiple communities since families all over cypress, long beach, Seal Beach, CPE all use the park for organized sports and events.

There will not be enough parking available at Arbor Park or the dog park. There would be major parking overflow into surrounding neighborhoods and Lamposn is a dangerous street to have children and families crossing to get to the soccer fields and dog parks.

There would not be enough parking for new residents and that would lead more traffic into the CPE neighborhood and lampson as well. There is not street parking so people would be forced to park in neighboring residences.

17-294

CPE has less park acreage than other neighborhoods in Seal Beach, Los Alamitos or Rossmoor. Arbor Park has helped fill that void by providing a large grass area to support organized and unorganized sports including soccer and baseball. Playground equipment in CPE is small and outdated. New development would increase traffic to the small playgrounds in CPE.

The area is not walkable for kids traveling to school or for families with no cars. Public transportation in the area is lacking. There are no walkable convenience stores, restaurants or grocery stores.

I believe with increased foot traffic and vehicles in the area could and would lead to additional targeting for crimes such as car break ins, porch thefts, vandalism.

Home values in the area would decline in the higher income housing. I also think that because of the higher end community that minorities and low income families would be excluded by neighboring residents.

Tom Oliver
Los Alamitos Planning Division
3191 Katella Avenue
Los Alamitos, CA 90720

Dear Tom,

I am writing regarding the city's request for comments and concerns related to the 4655 Lampson Avenue Project.

I write to you as a 6 year resident of Seal Beach (College Park East), a 47 year resident of OC (grew up in Huntington Beach), an AYSO Region 159 soccer coach, husband and a father of a 5 year old daughter.

I appreciate your time in reviewing my comments and those of my neighbors throughout our wonderful community that extends well past my neighborhood into Los Al, Rossmoor, Cypress, and Garden Grove nearby.

Like many I have spoken with in person and read in comments on social media (NextDoor and Facebook), the Lampson Project proposal is not only unpopular, it does NOT make sense. My concerns are as follows:

17-296

Transportation and Traffic

Lampson Avenue is not only used by the over 1,700 households in College Park East, but those who live nearby in Rossmoor, Los Al, and Garden Grove to go shopping, drop/pickup kids at school, and bypass freeway, for example. Lampson is only a two-lane street with constant use and at times, extremely congested causing long lines and waits for those turning north and south on Seal Beach Blvd. By adding an estimated 615 residents (246 units x estimate from consultant at scope meeting of 2.5 per household) and potentially over 500 additional cars daily, travel on Lampson Avenue will be a nightmare and for those of us who live in College Park East, we have no other options to enter/exit our neighborhood.

The plans drawn up for the new project show that the residences will only be able to turn right onto Lampson towards Seal Beach Blvd. For those who need to head east towards Garden Grove, they will need to make a U-turn at Heather Street, or Seal Beach Blvd, which will only exacerbate the traffic problem.

17-297

You do not have to talk to College Park East residents old or new for very long before the topic of conversation turns to safety. Lampson between Seal Beach Blvd and Rose St. is notorious for excessive speeding, traffic accidents, and fatalities. I live closer to Lampson and Basswood near the gas station, and I see people running the red lights all the time. I spoke with the owner of the car repair shop located at the gas station and he sees accidents at the intersection numerous times a month. Lampson in this area is known as "Dead Man's Curve" due to all the fatalities. There is a reason large rocks were put in the median on Lampson. Adding more cars in the area will only make things worse and by that being

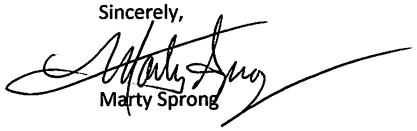
foreseen, opens up potential litigation to both Seal Beach and Los Alamitos. As far as a reasonable alternative and mitigation measure, that is up to the paid professionals to come up with, but the only ideas I have is either you completely stop the project or reduce the number of residences drastically.

I would also like to bring up parking for the new residences and their guests. There has not been enough parking planned for the new residences and their guests, which means they will walk across a busy Lampson street into the College Park East neighborhood and take up their parking spaces used for themselves or their guests. This will force Seal Beach to enforce permit parking, which will take Seal Beach city dollars to enforce. In speaking with neighbors near Heather Park (some are former and current police officers), they are concerned about people parking there as it invites crime. People not from around here will see open garages, nice homes, etc, which may lead to unwanted criminal activity.

17-297 (CONT.)

Recreation

As I mentioned earlier, I am an AYSO Region 159 coach and have been involved and influenced by AYSO since I first played soccer 44 years ago. Arbor Park has hosted countless soccer games for thousands of the communities' kids. Almost every kid in our community has experienced soccer and the sense of a team sport at one time or another due to AYSO. I can't stress enough how important this exposure is to our kids even if they decide not to further their soccer endeavors. It's a gateway to other sports and activities that are important to our kids, our community and ultimately leads to stronger students both academically and athletically.



We have used the site on Lampson as parking for many years because clearly, with 100 or less parking spots available currently at Arbor Park, it wouldn't be possible for us to play, or we would have to park in College Park East. That is not only a nuisance to the residences, but also very dangerous for those crossing the very busy Lampson Avenue. This needs to be avoided. As proposed, the Lampson project does not leave enough parking for the new residences and their guests, nor considers the people who use Arbor Park for soccer, general recreation, and use of the dog park. It's imperative that ample parking is made available for those that have used Arbor Park all these years.

Traffic, Safety, Parking, and Recreation – These are my main concerns that I am addressing here, but obvious issues like noise, additional pollution from more cars, stress on public services in both Los Al and Seal Beach are some of the others that I look forward to reading about in the EIR.

17-298

Thank you again for taking the time to review my comments. As a Seal Beach resident who lives in the community across from the proposed project, this is a big deal to me and my neighbors. I hope that you see that this will impact a few cities, not just yours and some will be impacted more than others; None more than your neighbors in Seal Beach. I ask that you take a moment and put yourself in my shoes. If this project goes through, it cannot be undone. I ask that you put our health, safety, and happiness in our community into consideration.

Sincerely,

Marty Sprong

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender heathcreightonrn@gmail.com

Dear Mr. Oliver,
I am writing to you to express my concerns over the Lampson project. There are many concerns regarding this project that are alarming. We are already challenged with medical response times and medical facilities are overcrowded. Adding additional volumes to this already overburdened system is very concerning. With the increased traffic that would be forced to use Lampson and make U-Turns at Heather Street only increases the risk for serious or fatal accidents. The lack of parks and play areas will overcrowd Heather Park which is already undersized for the CPE community. 17-299

The other area of concern that I have is related to the increased traffic. Lampson is the only street that connect to Seal Beach Blvd. this is the only access to all of the elementary schools that will be affiliated with this project. The traffic in the mornings is already very hectic and backed up on Lampson every school morning. Adding all of these additional residents would make it impossible to turn onto Lampson from Heather or Candleberry. With all of these additional vehicles I would request that an environmental study be conducted to see what the true impact is, not only with traffic, accident risk, but also emissions. Thank you for taking the time to read my concerns. I am very passionate about my community and am very concerned about the harm this project would cause to the community that I serve. 17-300

Thank you,
Heath Creighton

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender dbrandt660@gmail.com

Good morning,

I am writing to you as a resident of the City of Seal Beach, who is concerned about the proposed project at 4665 Lampson Ave. My name is Daniel Brandt and I have lived at 3761 Oleander Street for the past 6 years. Our neighborhood in the Seal Beach subdivision is referred to as College Park East (CPE). This neighborhood is a quiet suburb of single family residences. My wife and I moved to CPE from Long Beach to get away from the busy city life and enjoy a neighborhood which is safe for my children to grow up. We feel safe allowing our young children to ride their bikes in the street and play in our small, but quaint parks. I heard about the project when I saw a post on Nextdoor less than 2 weeks ago. I was shocked that the commenting period for the draft EIR was coming up on November 2nd. It appeared that there was no public outreach other than the mandated 500 feet notifications from the project site.

17-301

I attended the project scoping meeting, which was held at the Los Alamitos City Council Chambers on October 20th. Since the meeting, I have thoroughly reviewed the project proposal, met with the developer (George Voit), and met with the owner of C&C development (affordable apartment's developer). The glaring fact was that there was not enough parking for the density of the project. I was also concerned that with the increased number of vehicles that will be on Lampson, and no additional traffic control devices added to Lampson Ave. Lampson Ave. has been a dangerous street and has been the scene of many serious/deadly traffic collisions.

17-302

During my meeting with the owner of C&C development, he went over the scope of the development and provided me with information on their other prior affordable housing developments. I subsequently looked up the C&C development website and did a deep dive into their other affordable housing projects. What I concluded was that none of their prior projects were similar to the proposed Lampson Ave. project. Their other projects were located in true commercial areas, with plentiful street parking, away from residential neighborhoods. Other projects had much more parking and some even had underground parking structures and many of the projects were located near mass transit stations. A lot of the projects were affordable housing for seniors, which does not require as many parking spots. My

17-303

conclusion was that this high-density affordable housing build would be a first of a kind for this developer. The impacts of this development that they would be unable to quantify based on the unique location of the proposed development.

I understand that Lampson Ave. is technically considered a "commercial corridor," but the reality is that this area is a residential area, surrounded by two golf courses. First, there is no street parking on Lampson Ave. Second, Lampson Ave. is a two-lane highway, with many curves and only one sidewalk. Lastly, the area of the proposal is not walkable or safe for bicyclists (little to non-existent bike lanes). Furthermore, Lampson Ave. is already overused and underdeveloped to handle additional vehicles.

17-303 (CONT.)

After my meetings with the developers and reviewing the proposed plans, I have identified many potential negative impacts on the communities surrounding the proposed development at 4665 Lampson Ave. I will address those potential negative environmental impacts and require and answer to each of the following concerns:

Traffic

I believe there will be approximately 500 plus vehicles that will be utilized by residents of the project, based on the potential occupancy levels, which I will describe later in this email. I will specifically address the potential impacts the additional vehicles will have on Lampson Ave.

1) Lampson Ave. is a two-lane east/west asphalt street with a posted speed limit of 45 MPH. Between Seal Beach Blvd. and Valley View Ave. on Lampson Ave. there are six curves, which decreases visibility and braking reaction times for drivers approaching intersections on Lampson Ave. In the past, there have been many traffic collisions on Lampson Ave. between Seal Beach Blvd. and Valley View St. Many of these collisions have occurred at intersections with drivers making U-turns from westbound Lampson Ave. to eastbound Lampson Ave. In addition to the curves in the roadway, there are raised center medians with large trees and boulders, which also decreases visibility of drivers. Due to these trees and boulders, vehicles traveling eastbound Lampson Ave. approaching Candleberry Ave. and Heather Dr. have reduced visibility of vehicles traveling westbound on Lampson Ave. Based on the fact that vehicles exiting the project must make right turns out of the project, vehicles will be forced to make U-turns at either Basswood St., Candleberry Ave., and Heather Dr. if the drivers wants to travel to Valley View St. They will likely make U-turns at the three aforementioned intersections to drive towards Valley View St. Based on the speed limit of 45

17-304

MPH on Lampson Ave., the curves on the roadway, the reduced visibility from the boulders and trees in the center medians, I believe the added vehicles will be a safety hazard and will result in additional traffic collisions. I am requesting technical studies on the braking reaction times for vehicles traveling eastbound Lampson Ave. at the intersections of Basswood St., Candleberry Ave. and Heather Dr. I would like the study to address any additional traffic control signals devices or modifications needed to the existing devices.

2) During the morning hours, traffic becomes heavily congested for vehicles traveling westbound Lampson Ave. at the intersection of Seal Beach Blvd. In this area, there are two dedicated left turn lanes and one dedicated right turn lane for vehicular traffic intending to turn northbound or southbound Seal Beach Blvd. Just south of Lampson Ave. at Seal Beach Blvd. is the 405 Freeway. With the additional traffic intending on traveling to the 405 freeway, I am concerned about the two-left turn lanes on Lampson Ave. at Seal Beach Blvd. will not have the capacity to handle the additional vehicles. There will be additional congestion in the two dedicated left turn lanes for vehicles traveling to the 405 Freeway.

17-304 (CONT.)

Also, many of the residents of the development will have young kids, who will attend schools in the Los Alamitos Unified School District. The schools are located in the cities of either Rossmoor, Los Alamitos, or Seal Beach. In order to transport their children, they will need to travel westbound on Lampson Ave. towards Seal Beach Blvd. The new residents will increase the traffic congestion during the morning hours. Based on the fact that only one elementary school is located south of Lampson Ave. and the fact that the other five elementary schools, two middle schools, and one high school are located north of Lampson Ave., drivers will most likely travel northbound on Seal Beach Blvd. from Lampson Ave. The already congested one dedicated right turn lane westbound Lampson Ave. at Seal Beach Blvd. will become increasingly congested. I believe a second dedicated right turn lane should be added to handle the addition vehicles making right turns onto northbound Seal Beach Blvd. I am requesting a technical study on the phasing of the traffic control devices at Lampson Ave. and Seal Beach Blvd. and whether a right turn lane should be added.

Lastly, the vehicles stopped in the westbound lanes of Lampson Ave. in the right turn lane at Seal Beach Blvd. frequently back up to the intersection Lampson Ave. and Old Ranch Plaza. This additional traffic would impact the intersection of Lampson Ave. and Old Ranch Plaza. I am requesting a technical traffic times study of the traffic control devices at the intersection of Old Ranch Plaza and Lampson Ave. and would like to know what changes or modifications to these traffic control devices would be.

17-305

3) In the morning and afternoon hours, traffic from southbound Seal Beach Blvd. to eastbound Lampson Ave. is often congested. There are two dedicated left turn lanes at this location. I am concerned that traffic will be backed up to St. Cloud Dr. and cause a safety issue for those at the intersection of Seal Beach Blvd. and St. Cloud Dr. I do not believe the two dedicated left turn lanes are sufficient for the influx of vehicles wanting to make a left turn onto eastbound Lampson Ave. in the mornings and afternoons. I am requesting a study of the traffic control devices at southbound Seal Beach Blvd. at Lampson Ave. and additional lanes or modifications to the traffic control devices. I believe the two-way left turn lanes need to be lengthened to handle the additional vehicles making left turns.

4) Lampson Ave. is a two-lane highway in each direction between Seal Beach Blvd. and Valley View Dr. The marked bicycle lanes have a width of a few feet to non-existent in some locations. I am concerned that the additional traffic from the development will be a safety hazard for bicycles traveling on Lampson Ave. in the bicycle lane. I do not believe that the bicycle lanes are safe to use and should not be considered as a transportation source for new residents at the proposed development.

17-306

5) Lampson Ave. only has a narrow sidewalk on the south side of the street on Lampson Ave. between Seal Beach Blvd. and Tulip Dr., with the exception of a sidewalk on the north side in front of the proposed development. I am concerned about pedestrians crossing Lampson Ave. to walk to Heather Park in Seal Beach. The development does not have a planned park and Arbor Park does not have any play structures. It is likely that residents will use Heather Park as their primary recreational activity location. In addition, California's “jaywalking” law will change in January of 2023 and allow for people to cross any street, as long as they safely cross, without impeding vehicular traffic. I believe this will lead pedestrians crossing from the development to cross Lampson Ave. outside of the crosswalk. I am concerned that with the decreased visibility of drivers traveling eastbound Lampson Ave. due to the curves in the roadway, as well as the boulders and trees in the center medians, there will be an increase in pedestrian injuries /fatalities. I am requesting a study on the impact of foot traffic on Lampson Ave. due to the development. I also would like a sidewalk added to the north side of Lampson Ave. between Seal Beach Blvd. and Tulip Dr.

17-307

6) Valley View St. is a major arterial highway, which intersects with Lampson Ave. and this intersection is located east of the development. The eastbound Lanes of Lampson Ave. already become congested at the intersection. Eastbound Lampson Ave. at Valley View St. consist of two dedicated straight

17-308

lanes for eastbound traffic and one dedicated left turn lane for vehicles traveling northbound Valley View St. Based on the additional added vehicles of the development, I am requesting a technical study on the traffic signal time and where additional traffic signal devices need to be added or modified. Also, based on the additional traffic will add congestion to the number two lane of eastbound Lampson Ave. at Valley View St. Vehicle intending on traveling southbound Valley View St. in order to drive to the 405 Freeway / 22 Freeway will be slowed. I am requesting a dedicated right turn lane be added in this area for vehicles making a right turn from Lampson Ave. to southbound Valley View Dr.

7) Vehicles leaving the project intending to travel to Valley View St. will take the quickest route possible. Many vehicles traveling eastbound Lampson Ave. towards Valley View St. currently make a right turn onto Blackmer St. and to cut through the residential neighborhood to reach Valley View St. The vehicles will exit on Cerulean Ave. or Tiffany Ave. (Garden Grove) to Valley View Dr. in order to bypass traffic congestion on eastbound Lampson Ave. at Valley View Dr. I believe the additional vehicles from the development will impact the safety of the following street in Garden Grove: Blackmer St., Trinette Ave., Cerulean Ave. Tunstall St., St. Mark St., and Tiffany Ave. Based on the additional vehicle cut through traffic, I am requesting a technical traffic study on the aforementioned streets in Garden Grove.

17-308 (CONT.)

Parking

In addition to traffic issues, below I have broken down the potential occupancy of the apartment development, as well as the cluster/townhomes development.

Apartment Occupancy

	Quantity	Occupancy	Minimum	Maximum
77 total units				
(1) bedrooms	36	1-3 people		
36	108			
(2) bedrooms	20	2-5people		
40	100			
(3) bedrooms	21	3-7people	63	
147				
Total:	77			139
355				

Possible registered occupants range is 139-355 residents in only 77 apartment

17-309

units.

Lack of parking:

- 98 parking spots for between 139-355 residents.

- 30 assigned garages and 68 open parking spaces (first come, first serve)

Conclusion: The lack of parking will lead to residents and guests parking in CPE and surrounding communities. There is no parking on Lampson Ave.

17-309 (CONT.)

Cluster and Town Homes Occupancy
Cluster Homes
55 total units/ 220 total bedrooms
Townhomes
114 units / 321 bedrooms

Lack of parking:

- 54 driveways

- 90 open parking spaces

- 338 garage spaces

Conclusion: There is no street parking in the proposed neighborhood and garages many times are not used for parking. Enforcement of using garages would have to be carried out by the planned HOA for the cluster and townhouse communities. HOA's are ineffective in enforcing people to keep their garages open for parking. Many of the vehicles will be parking in CPE and surrounding communities. The lack of parking will not impact the City of Los Alamitos, but will impact residents of Seal Beach (CPE).

17-310

I believe that based on the number of occupants in these developments and the limited amount of planned parking, there will be approximately 250 plus vehicles parked on CPE streets on a daily/nightly basis. This lack of parking will increase vehicular traffic on the streets of CPE. I would like a comprehensive study on the potential occupancy of both developments and how many vehicles would be associated with the residents. The additional vehicles parking in the streets nightly will have an impact on roadways in CPE. I would like a technical study of how the extra vehicular traffic from the development will have cause wear and tear of the streets within CPE and Lampson Ave.

Parks

17-311

The proposed development only has a 14,000 open area for recreational activities. There are no play structures proposed except for a "tot lot" in the apartment building Arbor Park has open fields and a dog park, but no play equipment. Without a park

being built in the community, Heather Park across the street from the development will be heavily impacted. Heather Park is the most used park in CPE. The additional residents in the proposed development will primarily utilize Heather Park, making an aging and overused park more crowded. Due to the lack of parking in the development, many of those vehicles will take up the street parking surrounding Heather Park, restricting access to Heather Park by CPE residents.

Parking spaces at Arbor Park will also be used by residents and guests of the development rather than visitors of Arbor Park and the dog park.

I am requesting a technical study on the impact of parking at Arbor Park, which will be impacted by the development and restrict park use.

17-311 (CONT.)

Public Service

The development is located in the City of Los Alamitos, which is located far away from the Los Alamitos Police Department. The distance from the Los Alamitos Police Department will decrease response time for the residents in the proposed development. In addition, the Los Alamitos Police Department (LAPD) and the Seal Beach Police Department (SBPD) utilize the same radio frequency and respond to each other's calls for service. I believe that the Seal Beach Police Department will be utilized to respond to priority calls to the development in Los Alamitos and decrease the service level to Seal Beach residents. I am requesting a technical study of the impact the development will have on the SBPD services being deployed to the development to assist LAPD.

Residents of the development will be parking on CPE streets in the daytime and overnight hours due to the lack of parking in the development. SBPD will have increased calls for service from residents regarding illegally parked vehicles. These increased service call volumes will decrease the capacity of SBPD to respond to priority calls in the City of Seal Beach. I would like a technical study on whether additional police officers will need to be hired by the Seal Beach Police Department.

The Orange County Fire Department (OCFA) services many cities in Orange County, including Los Alamitos, Rossmoor and Seal Beach. The closest OCFA station is at Seal Beach Blvd. and Beverly Manor (Station 48). This station primarily services Leisure World, which is a large senior community, which places a high demand on this fire station. With the addition of approximately 800 residents in the development, the services from OCFA will be strained and residents of CPE and the surrounding communities will be impacted. Additional response time to Leisure World and their elderly population will be decreased because of the reallocation of service calls to the development. The next closest OCFA fire station is in Los Alamitos, which primarily services Los Alamitos and Rossmoor. I am requesting a technical study on the impact of the additional residents and the response times of the OCFA to the proposed development residents and residents of CPE and Leisure World.

17-312

Road impacts from heavy equipment

The City of Seal Beach prohibits trucks with a gross vehicle weight over 6,000 pounds from traveling on Lampson Ave., with limited exceptions. This prohibition is due to the damage heavy vehicles can do to the roadway. I would like this weight limit to be enforced during the demolition and construction of the proposed development. I would like a comprehensive study of how the developer would manage the demolition, removal of debris, and transportation of construction equipment and materials. This study should include the impact of the heavy equipment and loads will have to the integrity of Lampson Ave.

Construction Noise and road closure

The backyards of the homes on Ironwood Ave. directly across from the development will be severely impacted by construction noise and excess debris (dirt). The cinder block walls along the Lampson Ave between the sidewalk and their residents are short and need to be reconstructed to decrease the impact of construction noise. The residents between 4509 Ironwood Ave. and 4701 Ironwood Ave. will be impacted and need to have their cinder block walls rebuild higher. I am also requesting a technical study on the construction decibel noise levels and the impact on the Ironwood Ave. resident's health. What will be in place to monitor the decibel levels during construction?

Due to the road closures during the construction there will be an increase in cut through traffic in the CPE neighborhood. Lampson is only a two lane highway situated between to major arterial highways (Valley View St. and Seal Beach Blvd.). If there is construction and lane closures on Lampson Ave. vehicles cut through CPE and Garden Grove to reach Valley View St. or Seal Beach Blvd.This cut through traffic will decrease the safety of CPE and Garden Grove residents. I would like a study on cut through traffic in CPE and Garden Grove from construction on Lampson Ave.

17-313

Aesthetics

The front of the development directly off of Lampson Ave. will be two-stories high. Then all of the other residences will be three stories high. The affordable apartment building will be 3 stories high facing Lampson Ave. Based on the height of the construction and the low cinderblock walls of residents on Ironwood Ave. there will be several impacts to their environment.

One impact will be on the glare from the sun, which is overhead to the south in the afternoon. This will cause a bright glare from the reflection off the windows of the two and three story building of the development into the residents located between 4509 Ironwood Ave. and 4701 Ironwood Ave. I am requesting a technical study of

17-314

the impact of the angle of the sun and the potential glare from the developments residents and the Ironwood Ave. residents.

Secondly, the height of the two and three-story construction of the development and the short cinder block walls will lead to a lack of privacy for the Ironwood Ave. residents. I am requesting a visual simulation from the residents between 4509 Ironwood Ave. and 4701 Ironwood Ave.

17-314 (CONT.)

Rodents

During large construction projects rodents are dispersed into nearby residential neighborhoods. What are the plans to control and abate the influx of rodents in the Los Alamitos (Parkewood), CPE, and Garden Grove neighborhoods? Rodent displacement occurs during the excavation portion of the development, construction phase, and at the completion of the construction. I am requesting a comprehensive study on the rodent population in the development and the impacts to the surrounding communities.

17-315

Wildlife

The Joint Forces Training Base (JFTB) is home to a large coyote and rabbit population. I am concerned about the developments impact on their eco-system and I am requesting a technical study on the construction of the development and the impacts to the coyote and rabbit population on JFTB, which is located adjacent to the development.

17-316

Lighting

There is limited lighting on Lampson Ave. between Valley View St. and Seal Beach Blvd., with limited public transportation in the area of the development. There is a sidewalk in front of the development on the north side of Lampson Ave., but not east and west of the development. The sidewalk on the south side of Lampson is small, with limited lighting. Based on the need for residents of the new development to walk across Lampson or ride their bicycle in limited bicycle lanes, I am requesting a technical study on the street lighting in the area.

17-317

Thank you for listening to my concerns regarding this development and I look forward to answers to my issues and concerns, including the studies to lessen the impacts of this development.

Please feel to contact me with any questions:

Dear Personnel:
We have recently purchased a home in College Park East. We are absolutely hands down against a new development and hundreds of new homes adding traffic to our daily school commute to old town Seal Beach. As part of this community we never would have purchased our home in August if we knew hundreds of new households with cars and added traffic would be soon converging onto Lampson Ave every day. This will negatively affect so many things in our community including but not limited to:

17-318

Aesthetics
Air Quality
Cultural Resources
Construction Noise and road closure
Fire / Police / Medical Response
Greenhouse Gas Emissions
Hazards & Hazardous Materials
Land Use & Planning
Noise Pollution (vehicles on Lampson)
Population & Housing
Parking in our neighborhood
Public Services
Recreation
Road impacts from heavy equipment
Rodents
Schools / Libraries
Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc)
Utilities & Service Systems
Views from our backyards

17-319

Our children also play soccer at Arbor Park and our family uses the dog park. This would have a huge impact on this area in all the ways described. We already have a commute to McGaugh that is about 10-15 minutes. With this disproportionately large (relative to the area) addition of households to the proposed area this could add a huge burden for families already here in terms of commute time to school as well as be problematic in all the areas listed above.

This (on Lampson aka College Park East) area is a lovely and relatively quiet community where most households are families. Where we feel safe and it's not congested by traffic, pollution or too much housing squeezed into a small area. This is absolutely a HUGE loss to the hundreds of families already calling College Park east and the surrounding area home. Only a win for the developer.

Please listen to the residents and consider stopping this potentially devastating change to our community.

17-320

To Whom it May Concern,

I was born in Los Alamitos 53 years ago living in Carrier Row, Rossmoor and now College Park East. I was recently made aware of a building project that is set to go in on Lampson across from College Park East. Development is inevitable. I understand that. Our community is growing and being that we are Los Alamitos/Seal Beach, we will always continue to be a hotspot for young families. But I was appalled to hear that this project is moving quickly with little resistance or compliance to impact studies.

17-323

Since this is my first time ever addressing city officials regarding a development in our town, I want you to know that this project should have to submit to every study possible before being granted permission to build. Nobody should be above the rules and you folks should have all of the information as it pertains to environment, traffic, Fire and Police services, parking, overall population impact as well as school impact on our already overpopulated school district. This decision should not be taken lightly.

I would like to see our City of Seal Beach politicians getting involved in this fight against this project. How convenient is it for Los Al to approve this build when the majority of the impact is on the community College Park East (CPE). We would deal with the noise pollution, air quality, traffic and parking issues that come with building that many new homes not the City of Los Alamitos.

Somebody over there in the City of Seal Beach needs to stand up and fight for us in this neighborhood. **I DO NOT WANT THIS BUILD TO HAPPEN IN OUR NEIGHBORHOOD WITHOUT ALL THE PROPER IMPACT STUDIES DONE AND REVIEWED.**

17-324

Respectfully,

Terri Hubert

Good morning Tom,

The tone of my comments may overshadow the message. I would like to amend my comment to the following extent:

Please delete the last paragraph of the email I sent to you. I think the first paragraph I wrote conveys the message clearly. The last paragraph begins with, "Many of the residents…." Please delete this paragraph.

Thank you,
Nick Papadakis

The developer is required to review each Environmental concern.

They are counting on us not saying anything and breezing through the process.

Now is our time to stop this. Mention as many examples and be specific in asking for environmental/technical studies.

Please be generous when providing examples of how this project could negatively affect our community. Some examples are below, and don't forget to include your name, address, and contact information!

17-326

Aesthetics
Air Quality
Cultural Resources
Construction Noise and road closure
Fire / Police / Medical Response
Greenhouse Gas Emissions
Hazards & Hazardous Materials

17-327

Low income housing may include Section 8 government supported housing. Unfortunately there is a high incidence of crime associated with Section 8 tenants. Whether the proposed housing is Section 8 or not, why would any responsible city government permit low income housing to exist adjacent to relatively low crime neighborhoods such as Los Alamitos, Rossmoor, Seal Beach? Why would a responsible city council permit such an element into this area? Nonsense.

17-328

Many of the residents of this area own fire arms for good reason. Crime is rampant generally. People own fire arms for personal protection because the police have been hand cuffed. Imagine turning loose a low or no income population in the streets of the areas mentioned above. Such people are looking for opportunities to steal and maybe worse. Guns will be used.
Does the city council want gunfights in the streets? Keep the undesirable element away from this area. That is part of your job as public officials. As public servants you should protect your constituents from crime we see on TV occurring in other cities.

We have lived in College Park East for over 27 years. Our daughters went to McGaugh Elementary, McAuliffe Middle School and Los Alamitos High School. Our nice, quiet, peaceful area is going to be ruined by overbuilding on Lampson. I saw this happen when they tore down the movie theater on Seal Beach Blvd and put in more shops and stores and built The Target Center across the street. They have overbuilt and that brings more traffic which causes more car accidents just in sheer volume alone. They are ruining the area with over building and making it turn into a miniature Los Angeles. We moved to this part of Orange County to escape the LA congestion and traffic and if this project goes forward we will be truly following in the footsteps that have made living in Los Angeles a nightmare for so many. Either stop the project altogether and leave the open space on Lampson as it is or scale back the project in a huge way. Otherwise our beautiful small town will truly turn into Los Angeles. It is already heading in that direction, judging by the construction on continual construction on Katella.
Thank you for listening.

As a concerned citizen, mother and grandmother, I can't even believe that this project would even be considered. I have lived in this community for 36 years and have seen changes and growth for the most part that has been beneficial to the community. This project is definitely not beneficial to anyone except maybe the developer! There are so many negatives more than positive features that it is truly hard to imagine that a project like this could even be considered. 17-331

Air quality has already been compromised by the expansion of the freeway. My daughters live in College Park East and I have seen the traffic increase on Lampson in the last 5 years. The accidents have also increased even if some have only been fender benders. Where is the extra water supply going to come from for all these units? Arbor Park has been a great resource for the youth of our community for many years. My children and now my grandchildren have played soccer and even baseball there. Where would the parking be for the participants and spectators if housing was built on that property where there would probably already be not enough parking for the residents of the new project? The College Park East residents already know that parking is at a premium.Our children need a place to exercise and maintain a healthy lifestyle. The parks that are available cannot handle the extra influx of people. Please, please reconsider this project and vote down this horrendous idea!! 17-332

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender skfpowell@gmail.com

Good morning,

I am writing in regards to the proposed housing development on Lampson Avenue. As a resident of College Park East living in a home which backs directly up to Lampson Avenue our family has first-hand knowledge of the traffic, noise and safety of this already busy section of road. In fact, a car once lost control and crashed through our back wall and into our back yard several years ago. Fortunately, no one was seriously injured in that case. The many other traffic accidents that occur, however, haven't had the same outcome. Such a large increase in traffic on an already busy road will undoubtedly increase these accidents, injuries and fatalities, and this is not acceptable. 17-334

In addition to the increase in accidents, the increase in traffic noise as well as construction noise and pollution will be greatly detrimental to the quality of life for those of us in the surrounding areas. The air quality will be negatively affected as well. 17-335

While these are some of the biggest concerns we have, they are definitely not the only detriments this project will force on the current residents, both human and animal alike. There is already a scarcity of green space available for human recreation, as well as area wildlife, including many bird species and the burrowing owl. For an area that is already densely populated and resource thin, the addition of this high number of new residents is not supported. We strongly object to this proposed development and ask that this project be halted. 17-336

Dear City Officials,

I recently moved to College Park East from Los Angeles. Having lived in various parts of LA my entire life, I was ready for a better quality of life. So I made the move to the beautiful city of Seal Beach. I wanted to leave behind the overpopulated streets and parks, traffic, noise and air pollution, and crime. So I was very disheartened when I heard about the Lampson project. I know what it's like to drive for 50 minutes to go 3 miles on surface streets. On really bad days, my husband used to park his car on the street in rush hour traffic and walk home because the cars wouldn't move. He'd go back at 10pm to get his car. There is already a long line to turn right onto Seal Beach Blvd. from Lampson in the mornings when I take my kids to school. If the housing development goes up, there will be too many cars, people driving more recklessly, and more accidents.
I don't want to see 4 cars turning left at the end of the signal light when it should be 2. I don't want angry drivers and people. I don't want the parks and schools to get overcrowded. In short, I don't want our neighborhood to turn into LA.

I earnestly urge you to please consider how detrimental this housing development would be not only to the current residents but to the environment as well. Please help us to keep Seal Beach a safe and beautiful place to call home. Thank you very much.

Sincerely,

Jarnette Lee

As a resident of college park east I am worried about Noise Pollution (vehicles on Lampson). Parking in our neighborhood will be impacted severely along with Road impacts from heavy equipment. 17-338

Most importantly I'm worried about Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc) lampson is such a dangerous street as is I feel like this is not the right area for this new development. Because there is no parks in the plan! The parks in college park east will be impacted. these parks are already needing safety updates and renovation 17-339

Dear Mr Oliver and the City of Los Alamitos Planning Division,

My name is Suzy Mokhtari I wanted to voice my concern for the proposed development at Arbor Park. While it is a beautiful concept to provide safe housing opportunities for lower income families, we all deserve a plan for parking, open play spaces, and traffic rules. As a pediatrician, CPE homeowner, mom of 3, and human rights advocate, I am concerned this project has not been fully thought out in providing safe living spaces for all.

I appreciate your diligence in keeping our community safe!

Suzy Mokhtari, MD, MPH

Please don't allow this project to move forward. It will have a lasting impact that will negatively affect our city.

Why do we need more housing like this? The revenue from it is not worth the:
Additional Traffic which impacts Air Quality

Construction Noise and road closure in order to build it

Noise Pollution (vehicles on Lampson)

Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc)

Loss of Parking in our neighborhood

Last but not least, the impact to our Schools. Increased class size is not ok.

Thank you for your consideration.

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender tiffanyjoyner13@gmail.com

To The Cities of Los Alamitos and Seal Beach,

I wanted to voice my opinion and concerns about the Lampson Project. I currently reside at 4448 Hazelnut Ave in Seal Beach. We are located directly across from Heather park.

We have 2 small children, ages 7 and 10, who play at heather park as well as play outside and ride bikes outside our house. I am concerned for their safety as the project will increase traffic and cars significantly in our neighborhood. I am also concerned about the impact it will have on our already run down parks in college park east as well as parking. Another huge concern is the safety on Lampson, as it is already a dangerous stretch of road with MANY accidents and even fatalities.

This project will also impact College Park East housing prices in a negative way and will make this community lose its feeling of being a small quiet community.

17-342

Other concerns are;

Aesthetics
Air Quality
Cultural Resources
Construction Noise and road closure
Fire / Police / Medical Response
Greenhouse Gas Emissions
Hazards & Hazardous Materials
Land Use & Planning
Noise Pollution (vehicles on Lampson)
Population & Housing
Parking in our neighborhood
Public Services
Recreation
Road impacts from heavy equipment
Rodents
Schools / Libraries
Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc)
Utilities & Service Systems
Views from our backyards

Please hear our voices of concern as the whole neighborhood and surrounding areas do NOT want this to happen.

Thanks you,
Tiffany Joyner

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender fredschutz@roadrunner.com

I am writing you to disclose how your Lampson Project will create a negative effect to my personal health. I have respiratory issues. As my backyard sits on Lampson, the dust during the construction will be intolerable. In addition, the dust from the additional traffic after the construction is complete will further contribute to my breathing issues. 17-344

Beyond my personal health, not one neighbor has welcomed this plan.

There is no plan for the increased traffic on Lampson. No additional traffic lights. No left turn signals. Cars traveling east will need to make U turns on Rose or Heather Street going west. It is likely these new neighbors will increase traffic inside CPE because Lampson was not designed for so much more traffic. And there is no plan for increasing lanes on Lampson. And even if there is, who wants to live behind a 6 lane road? It would be like living behind Beach Blvd. 17-345

The current level of noise is barely acceptable. When we bought our house, we were told the price was lower than the houses a few streets inside CPE because we were on Lampson, and it might be a little more noisy. Now that you are planning on having 550 cars (not to mention the guests of these new neighbors) in addition to what we have been suffering, I can only imagine how much more my home will depreciate, and how much more outside noise we will have to tolerate. 17-346

CPE has delightful little parks. Based upon the projected map of the project, there are no parks included. Which means we can expect to have a few thousand new neighbors overcrowding the small parks we have. 17-347

I haven't seen any proposal for additional fire or police. Even though our neighborhood will be increasing by several thousand people. Speaking of which, aren't projects like this one reserved for non-residential areas? Clearly one building does not define a commercial area. 17-348

What will happen when I can't even park in front of my house because there won't be enough spaces in the proposed development?

I do not feel a change in this community should be left to one investor or a few city managers. You have no right to affect my health or quality of life. At the very least, it should be put on a ballot. And not a Los Alamitos ballot, but a Seal Beach one. 17-349

Thank you for your time.

Regards,

Fred Schutz

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender jessica.polye78@gmail.com

Mr. Oliver,

I am a resident of the College Park East community in Seal Beach and I am writing to express my grave concern regarding the impacts of a potential housing development slated to be built at 4665 Lampson Avenue in Los Alamitos ("Lampson Avenue Project").

This new, high-density development will have a myriad of negative impacts on our community both from a quality of life AND environmental standpoint. As a College Park East resident who lives on Ironwood Avenue, which runs parallel to Lampson Avenue, I already experience a great deal of sound pollution from the ever-increasing traffic just beyond my backyard wall. Adding a development to accommodate 800+ additional residents, along with their guests, will only add to the sound pollution from the added traffic and make the northside Ironwood Avenue residents' backyards unbearable during certain times of day.

17-350

Just as concerning as the sound pollution from additional vehicles on Lampson is the increased traffic as a result. Lampson is already a very dangerous road with numerous accidents occurring on a regular basis. The area of Lampson that runs along the community of College Park East has historically been known as "The Alley of Death," due to the significant number of fatalities that have occurred in the area. With no space to expand Lampson, the increased traffic will only add to the number of dangerous and deadly accidents. Below are some examples worth noting of accidents in this area of Lampson. One of these is from this past month (October 2022). Another involves a child. I have 3 children of my own, who often ride their bikes in the area, and I do not want their abilities to ride in the area to be hindered by uncontrollable traffic that cannot be accommodated by the Lampson intersections.

General safety and pedestrian safety should be a top priority for both the city of Los Alamitos and Seal Beach. An increase in injury and death rates in the area should not be on anyone's conscience.

https://www.sunnews.org/drunk-driver-gets-15-to-life-for-lampson-avenue-death/
https://www.latimes.com/archives/la-xpm-1989-09-11-me-1559-story.html
https://www.oc-breeze.com/2022/10/04/219326_seal-beach-police-investigating-serious-traffic-collision-involving-two-vehicles-on-lampson-avenue/
https://www.laweekly.com/rider-hospitalized-motorcycle-crash-lampson-avenue-seal-beach-ca/
https://www.ocregister.com/2013/06/17/lampson-speeds-scrutinized-after-accidents/

17-351

While dangerously increasing traffic and noise pollution are of utmost concern, there are also several other factors that are essential for the City of Los Alamitos to investigate. Below is a list of concerns that MUST be addressed in the environmental impact assessments:

- Aesthetics (visual perception of environment)
  - Daytime glare and its impact on drivers, cyclists and neighboring homes
  - Nighttime illumination
  - Existing visual characteristics

17-352

- Property Values
  - Existing home values are likely to decrease and be adversely impacted due to additional multi-family dwellings alleviating housing pressure in an area that is primarily single family homes
- Air Quality and Environmental Conditions
  - Increased carbon monoxide emissions
  - Increased particulate matter
  - Increased greenhouse gas emissions
- Biological Impacts
  - The appropriate agencies must investigate how this development will impact local wildlife
  - There are a large number and variety of birds in the area – hawks, falcons and other large birds of prey, as well as squirrels and other varieties of smaller birds
    - Do any of these birds nest and feed in the vicinity of the development site?
    - Do any of these birds of prey have special environmental protective or endangered status?
  - How many trees will be eliminated for this project and how will this impact shade and air quality?
- Geology and Soils
  - Impact on drainage in the area
  - Runoff concerns
  - How will the local soccer field conditions be impacted?
- Public Protection Services Impact
  - Fire protection
    - High population density requires additional fire protection services
    - Multi-family dwellings tend to require more fire protection
  - Police protection
    - High population density requires additional fire protection services
    - Is there an expectation that crime may increase in the general vicinity due to a higher population density?
    - Additional police support from the City of Seal Beach will be required as a result of a development that is taking place in a separate city (Los Alamitos), which will impact Seal Beach taxes
- Other Public Services
  - Library
    - Can local libraries accommodate the additional residents?
  - Parks and Recreation (There are no planned parks or play areas for the residents of this development which will directly impact College Park East parks)
    - Can local parks accommodate the additional residents causing an increased rate of wear and tear?

17-353

17-354

17-355

17-356

17-357

As the leader of the city council in Los Alamitos, it is imperative that you perform the necessary steps and due diligence to halt the Lampson Project. I urge you to disapprove the current proposed development plan, reassess and preserve the well-being of the surrounding communities.

Regards,

Mike and Jessica Polye

Hello,
I strongly oppose the Lampson housing project. The project will cause many problems such as traffic congestion on Lampson, parking problems for nearby home owners, noise pollution, increased need for fire/police resources, construction noise and impact public services. There will be a large impact to the homeowner of the College Park East neighbor with no benefit to them.

I hope you consider these effects on the nearby homeowners in the neighborhood and oppose this new development.

Thank you,

Matthew Stachowiak

Dear City of Los Alamitos,

I have been living in Seal Beach College Park East for 3.5 years now. We moved here for larger space and the school district for my three little girls. The many things I love about this area is the beautiful environment, places to play and ride around, and the easy flow of traffic on Lampson to get my kids to school on time. Unfortunately, I am fearful of this Lampson Project going through for two main reasons:

1. My house happens to be on Ironwood, the closest street from Lampson, where most outside cars will inevitably have to park.
2. Impact on Lampson traffic. Lampson is a quick flowing street which tends to back up if there is any hiccup. Adding more housing to this street, practically a one-way- out street will make everything more difficult for all involved in a daily basis.

I am hoping to be heard on this issue. I love this area and didn't settle into this expensive home to be impacted so much in such a negative way.

I am hoping the plans get revamped or moved altogether, in an area where it makes more sense.

Thank you for your time.

Sincerely,
Chrysanthi & Nick Davilas

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender jaclynpow@gmail.com

To whom this may concern,

You cannot build the projected Lampson Ave. development for multiple reasons. I am a young mother living in College Park East with two young children aged 7 and 4. Our 4 year old son has environmental allergies and skin eczema, which is impaired with poor air quality. When the air quality is poor, he suffers from asthma attacks. His skin also flairs up with itchy eczema. The machinery and vehicles needed for the development on Lampson Ave. will produce pollutants and impact the air quality. This will cause an asthma attack that could send my son to the emergency room, which is a financial burden, even having health insurance. His skin will be itchy and he itches until he bleeds when it's bad. Will you provide financial assistance to cover this cost?

What about those living nearby without the resources that I have, such as health insurance? What can you provide for them? I have transportation, it will be halted by your project and cause a burden to them. What about those without health insurance and the impact the air quality you produce will cause them? That will be a huge detriment to them.

17-361

The absurd amount of traffic we will all experience is going to be horrific. We have 9 schools in Seal Beach, Rossmoor and Los Alamitos that are impacted with kids coming and going to school. As a mother who drives her kids to and from school, I do not welcome any road closures. The parking within College Park East is going to be completely insane. Car break ins are going to increase! Crime is going to increase near my home with my small children! No!! If my husband works late, I cannot imagine having to experience criminals in our neighborhood alone.

Closing the road will hurt emergency responders helping anyone in need who live off of Lampson Ave. and nearby. My children and my family are my world and if anything happened and God forbid I had to call 911 for help, your project would lengthen the time it would take him to get to us. Every second counts in an emergency. Whether a child is choking, bleeding badly, having an asthma attack, etc.

17-362

There are a lot of new families close the projected area on Lampson. As a mother, I know very well how important the quiet is for (a baby especially) sleep. If there are loud noises from this that wake up sleeping babies, toddlers, children, adolescents, young adults needing to go to work, that would be a huge stress and burden to all of those families. My family included.

17-363

Traffic safety on Lampson with this project is going to be critically low. The u-turns needing to be made, road rage it will cause, the cut-thru traffic into the neighborhood I live in is unwelcome. There will be extra cars with more frustrated drivers and that is a dangerous combination.

17-364

The Lampson Ave. is already a busy street that goes through many cities. It is heavily trafficked and does not need any more traffic. Especially right by our small neighborhood. It is NOT welcomed and will produce more pollution, car accidents, traffic, unsafe driving, and delay commutes for everyone.

17-364 (CONT.)

Youth sports at Heather Park and Arbor Park will be stopped during this project. AYSO soccer plays at Heather Park and your project will stop and relocate all of hose practices and games. That is a burden of time for all of those children and their families, please respect us local families and our time.

This is not a positive project either. The housing and population you want is completely unwelcome by my whole family and many of my neighbors and friends. Please do not do this project, please. My family is my world and my life savings have gone into our home. If you make our home a lower value from this project, we will be devastated. Please do not build low income homes there. We are a nice city with high property value that we paid for. We are good people with honest jobs, kids in school and pets in our home. My parents and grandparents live in college park East on Sunflower and on Ironwood. We live on Dogwood and cherish this small city and quaint neighborhood. Please do not put in low income housing on Lampson Ave. I beg of you. We do not want it. Please stop this project. We do not see any positives from it, and only many negatives that I have mentioned above.

To: The City of Los Alamitos,
From: Marilyn Riordan
Resident of CPE,
Seal Beach, CA

I am strongly opposed to the proposed housing project on Lampson Avenue between Seal Beach Boulevard and Valley view Boulevard in Los Alamitos. I am a tax paying homeowner with many objections. The following are my concerns:

Aesthetics
Air Quality
Water
Cultural Resources
Construction Noise and road closure
Fire / Police / Medical Response
Greenhouse Gas Emissions
Hazards & Hazardous Materials
Land Use & Planning
Noise Pollution (vehicles on Lampson)
Population & Housing
Parking in our neighborhood
Public Services
Recreation
Road impacts from heavy equipment
Rodents
Schools / Libraries
Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc)
Utilities & Service Systems
Views from our backyards

Awaiting your reply,

Marilyn Riordan
CPE Home owner
Seal Beach, CA

Dear All

It is remarkable to propose this location for such a high density, boilerplate housing project. The idea of state mandating housing is rather ridiculous by itself and most likely won't achieve the results it is intended to, but proposing this right next to a neighborhood with completely different characteristics defies pretty much every urban planning principle in the book. Self inflicted wound is perhaps best way to describe this, very short sighted. Destroying livability is essentially akin to asking those who live there to move somewhere else. Perfect way to diminish the attractiveness of the city in the long term by making life miserable for those who live there.

17-367

Clearly this can have a significant impact on our neighborhood and such consequences will be unacceptable and unfair but ultimate losers will also include the city of los Alamitos and city of seal beach.

This project location appears to be ill conceived in many ways. Right next to Arbor and Dog parks, which are two of the busiest recreation areas in the city, with arbor park hosting soccer events every week. There is absolutely no way lampson can handle this added traffic due to this development. There is absolutely no way our parks can handle this additional demand from the new condensed housing. It will create parking issues in our neighborhood, crime will go up. It will be a disaster from urban planning perspective and not only diminish value of our neighborhood but our city as well.

17-368

As a CPE resident, and an engineer/consultant who has contributed to many planning studies as part of numerous developments across California, I strongly recommend reconsidering the proposed location for the high density housing. This will certainly have a significantly negative impact to its neighbors. And those "neighbors" will likely use every legal tool they have to oppose this development location of which not only defies common sense but likely would not pass any objective criteria/test either. Hopefully, this idea goes away but if not an extensive due dilligence process should be expected and planned. Studies by reputable consultants/experts that investigate and quantify the short/long term impact of the proposed location on its surrounding communities and the city overall should be performed. If these studies are done by the developer, they should be independently peer reviewed by the city and findings should be objectively reconciled. Community members also should be given access to these studies and also an opportunity to perform independent peer reviews, and city should collect their comments. All comments need to should be addressed satisfactorily.

17-369

To whom it may concern,

I am a resident of the College Park East neighborhood and strongly oppose building housing of any kind off of Lampson. I have lived in the area since I was 12 years old, went to Pacifica High School and then CSULB. My first job was at the shopping center in Rossmoor. I love this area so much I bought my first home here at 4424 Ironwood ave in 2019. I walk my dog to the dog park daily and watch fireworks in the open field on fourth of July. Putting housing here will destroy my neighborhood for all of the reasons below, do not let this happen!

17-370

Aesthetics - this will be a major eye sore and disrupt all our mature greenery and open space that we enjoy
Air Quality - more emissions from new drivers will cause terrible air quality
Cultural Resources - low income housing will only bring crime and addiction and problems to our quiet neighborhood. Even normal housing will cause a strain on our natural and government resources as it is
Construction Noise and road closure - Lampson is the only route through this area and will force countless people all the way to Katella and major traffic problems. The noise will be unbearable and we already have problems with the base and airplanes at all hours we cannot accept any more noise
Road safety - this road is not safe for a higher volume of drivers and it will become extremely unsafe for pedestrians and kids in the area
Fire / Police / Medical Response - los alamitos response time to emergencies is frightening and already causes Seal beach to assist calls, this will strain neighboring city resources
Greenhouse Gas Emissions - cars are terrible for the environment we cannot accept any more emissions on top of what we handle from the 405 and airport
Hazards & Hazardous Materials - the runoff from new buildings will be a major problem and we already have a flooding issue in this area, more water and sewage will only exacerbate this problem
Land Use & Planning - we dont have enough natural resources for more bodies and Lampson cannot handle additional drivers
Noise Pollution (vehicles on Lampson) - low income housing will bring people who have noisy cars and work odd hours causing too much noise
Population & Housing - there are too many people here we dont want a higher population
Parking in our neighborhood
Public Services - police and fire are already understaffed they cannot handle more of a burden which means we are all in greater danger
Recreation - this will drastically impact the dog park and the ayso fields and the green space in our community. We cannot accept more people in our limited spaces.
Road impacts from heavy equipment - lampson will get destroyed
Schools / Libraries - the schools are already overburdened and wont get any additional funding from this for years to come
Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc) this is a major concern as this area is already extremely dangerous!
Utilities & Service Systems - we dont have the natural resources to support more families in this area
Views from our backyards - will destroy my view of the Base and the fields

Hi !
I am writing an email to stop the Lampson project! This project will negatively affect our community.
Here are my concerns :

Air Quality/ noise pollution/transportation and traffic- the housing project will create more traffic and congestion on Lampson Ave which is already congested to begin with . This can affect the neighborhood air quality /noise pollution in addition to the 405 freeway close to our neighborhood. More traffic on Lampson is dangerous and can create more accidents. I've seen a lot of accidents on Lampson because it is a busy street. There is a lot of traffic especially in the morning when parents are rushing to get their kids to school on time. There are times when I leave 20 min early to drop off my kid to school, my kid has been late to school because the amount of traffic on Lampson and on Seal Beach Blvd . There is only 1 Turing lane to get to the schools on Lampson. Imagine 1 turning lane for all the families who live in the neighborhood to get to school.

With the amount of traffic added due to the Lampson project, I wouldn't feel safe to walk or jog in the neighborhood. Our street is already narrow and most of the sidewalks in College Park East are partial so we are compelled to walk on the street. More traffic equals more air pollution and is unhealthy for us and our children who plays outside. My child already suffers from asthma.

And what about parking? The housing plan may not have enough parking spaces for tenants. People will use the neighborhood for parking and will create congested with more cars on the street which can be dangerous for our kids who ride their bikes and walk on the streets.

17-372

Hazards & Hazardous Materials: building new homes can create dust and hazardous materials into our neighborhood. We take pride in keeping our neighborhood clean and safe.

17-373

Land Use & Planning: the housing plan is to create more housing in such a small space . We need the area for our kids to play and use the field for recreation purposes such as utilizing the field for soccer games and for our dogs to play. Our family also use the field to picnic and enjoy the wide space for activities.

Low income housing : low income housing will increase crime in our neighborhood.

Please, do not build this housing project on Lampson! It is not safe and will lot work with our already congested neighborhood. Thank you!

IRONSCALES finds this email suspicious! We know Chris Stone by name, but the email was sent from an unfamiliar address cmstone4525@yahoo.com | Know this sender?

I am writing to express my deep concern re: the Lampson Project. I live in College Park East. Lampson is already a busy street with a high accident rate; adding more traffic does not make sense. I anticipate drivers will elect to cut through our neighborhood using Ironwood and Hazelnut to avoid the inevitable delays along Lampson. This will put our children at risk. I'm also concerned the increased traffic and additional residents will affect our police and fire response in emergencies.
I can only imagine the nightmare it will be during construction.
I hope you will consider the negative impact this Los Alamitos project will have on the citizens of Seal Beach. Residents of Los Alamitos will not be affected at all, yet Seal Beach residents will truly suffer.
Sincerely,
Christine Stone

17-375

THIS IS A TEMPLATE, PLEASE REVIEW AND WRITE YOUR OWN EMAIL USING THE SUGGESTED TOPICS BELOW

The developer is required to review each Environmental concern.

They are counting on us not saying anything and breezing through the process.

Now is our time to stop this. Mention as many examples and be specific in asking for environmental/technical studies.

Please be generous when providing examples of how this project could negatively affect our community. Some examples are below, and don't forget to include your name, address, and contact information!

Aesthetics
Air Quality
Cultural Resources
Construction Noise and road closure
Fire / Police / Medical Response
Greenhouse Gas Emissions
Hazards & Hazardous Materials
Land Use & Planning
Noise Pollution (vehicles on Lampson)
Population & Housing
Parking in our neighborhood
Public Services

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender mike.polye@gmail.com

Mr. Oliver,

I am a resident of the College Park East community in Seal Beach and I am writing to express my grave concern regarding the impacts of a potential housing development slated to be built at 4665 Lampson Avenue in Los Alamitos ("Lampson Avenue Project").

This new, high-density development will have a myriad of negative impacts on our community both from a quality of life AND environmental standpoint. As a College Park East resident who lives on Ironwood Avenue, which runs parallel to Lampson Avenue, I already experience a great deal of sound pollution from the ever-increasing traffic just beyond my backyard wall. Adding a development to accommodate 800+ additional residents, along with their guests, will only add to the sound pollution from the added traffic and make the northside Ironwood Avenue residents' backyards unbearable during certain times of day.

17-377

Just as concerning as the sound pollution from additional vehicles on Lampson is the increased traffic as a result. Lampson is already a very dangerous road with numerous accidents occurring on a regular basis. The area of Lampson that runs along the community of College Park East has historically been known as "The Alley of Death," due to the significant number of fatalities that have occurred in the area. With no space to expand Lampson, the increased traffic will only add to the number of dangerous and deadly accidents. Below are some examples worth noting of accidents in this area of Lampson. One of these is from this past month (October 2022). Another involves a child. I have 3 children of my own, who often ride their bikes in the area, and I do not want their abilities to ride in the area to be hindered by uncontrollable traffic that cannot be accommodated by the Lampson intersections.

General safety and pedestrian safety should be a top priority for both the city of Los Alamitos and Seal Beach. An increase in injury and death rates in the area should not be on anyone's conscience.

https://www.sunnews.org/drunk-driver-gets-15-to-life-for-lampson-avenue-death/
https://www.latimes.com/archives/la-xpm-1989-09-11-me-1559-story.html
https://www.oc-breeze.com/2022/10/04/219326_seal-beach-police-investigating-serious-traffic-collision-involving-two-vehicles-on-lampson-avenue/

https://www.ocregister.com/2013/06/17/lampson-speeds-scrutinized-after-accidents/

17-378

While dangerously increasing traffic and noise pollution are of utmost concern, there are also several other factors that are essential for the City of Los Alamitos to investigate. Below is a list of concerns that MUST be addressed in the environmental impact assessments:

- Aesthetics (visual perception of environment)
    - Daytime glare and its impact on drivers, cyclists and neighboring homes

17-379

- Nighttime illumination
- Existing visual characteristics

- Property Values
  - Existing home values are likely to decrease and be adversely impacted due to additional multi-family dwellings alleviating housing pressure in an area that is primarily single family homes
- Air Quality and Environmental Conditions
  - Increased carbon monoxide emissions
  - Increased particulate matter
  - Increased greenhouse gas emissions
- Biological Impacts
  - The appropriate agencies must investigate how this development will impact local wildlife
  - There are a large number and variety of birds in the area – hawks, falcons and other large birds of prey, as well as squirrels and other varieties of smaller birds
    - Do any of these birds nest and feed in the vicinity of the development site?
    - Do any of these birds of prey have special environmental protective or endangered status?
  - How many trees will be eliminated for this project and how will this impact shade and air quality?
- Geology and Soils
  - Impact on drainage in the area
  - Runoff concerns
  - How will the local soccer field conditions be impacted?
- Public Protection Services Impact
  - Fire protection
    - High population density requires additional fire protection services
    - Multi-family dwellings tend to require more fire protection
  - Police protection
    - High population density requires additional fire protection services
    - Is there an expectation that crime may increase in the general vicinity due to a higher population density?
    - Additional police support from the City of Seal Beach will be required as a result of a development that is taking place in a separate city (Los Alamitos), which will impact Seal Beach taxes
- Other Public Services
  - Library
    - Can local libraries accommodate the additional residents?
  - Parks and Recreation (There are no planned parks or play areas for the residents of this development which will directly impact College Park East parks)
    - Can local parks accommodate the additional residents causing an increased rate of wear and tear?

As the leader of the city council in Los Alamitos, it is imperative that you perform the necessary steps and due diligence to halt the Lampson Project. I urge you to disapprove the current proposed development plan, reassess and preserve the well-being of the surrounding communities.

Regards,

Mike and Jessica Polye

Hello,
I strongly oppose the Lampson housing project. The project will cause many problems such as traffic congestion on Lampson, parking problems for nearby home owners, noise pollution, increased need for fire/police resources, construction noise and impact public services. There will be a large impact to the homeowner of the College Park East neighbor with no benefit to them.

I hope you consider these effects on the nearby homeowners in the neighborhood and oppose this new development.

Thank you,

Matthew Stachowiak

Dear City of Los Alamitos,

I have been living in Seal Beach College Park East for 3.5 years now. We moved here for larger space and the school district for my three little girls. The many things I love about this area is the beautiful environment, places to play and ride around, and the easy flow of traffic on Lampson to get my kids to school on time. Unfortunately, I am fearful of this Lampson Project going through for two main reasons:

1. My house happens to be on Ironwood, the closest street from Lampson, where most outside cars will inevitably have to park.
2. Impact on Lampson traffic. Lampson is a quick flowing street which tends to back up if there is any hiccup. Adding more housing to this street, practically a one-way- out street will make everything more difficult for all involved in a daily basis.

I am hoping to be heard on this issue. I love this area and didn't settle into this expensive home to be impacted so much in such a negative way.

I am hoping the plans get revamped or moved altogether, in an area where it makes more sense.

Thank you for your time.

Sincerely,
Chrysanthi & Nick Davilas

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender jaclynpow@gmail.com

To whom this may concern,

You cannot build the projected Lampson Ave. development for multiple reasons. I am a young mother living in College Park East with two young children aged 7 and 4. Our 4 year old son has environmental allergies and skin eczema, which is impaired with poor air quality. When the air quality is poor, he suffers from asthma attacks. His skin also flairs up with itchy eczema. The machinery and vehicles needed for the development on Lampson Ave. will produce pollutants and impact the air quality. This will cause an asthma attack that could send my son to the emergency room, which is a financial burden, even having health insurance. His skin will be itchy and he itches until he bleeds when it's bad. Will you provide financial assistance to cover this cost?

What about those living nearby without the resources that I have, such as health insurance? What can you provide for them? I have transportation, it will be halted by your project and cause a burden to them. What about those without health insurance and the impact the air quality you produce will cause them? That will be a huge detriment to them.

17-388

The absurd amount of traffic we will all experience is going to be horrific. We have 9 schools in Seal Beach, Rossmoor and Los Alamitos that are impacted with kids coming and going to school. As a mother who drives her kids to and from school, I do not welcome any road closures. The parking within College Park East is going to be completely insane. Car break ins are going to increase! Crime is going to increase near my home with my small children! No!! If my husband works late, I cannot imagine having to experience criminals in our neighborhood alone.

Closing the road will hurt emergency responders helping anyone in need who live off of Lampson Ave. and nearby. My children and my family are my world and if anything happened and God forbid I had to call 911 for help, your project would lengthen the time it would take him to get to us. Every second counts in an emergency. Whether a child is choking, bleeding badly, having an asthma attack, etc.

17-389

There are a lot of new families close the projected area on Lampson. As a mother, I know very well how important the quiet is for (a baby especially) sleep. If there are loud noises from this that wake up sleeping babies, toddlers, children, adolescents, young adults needing to go to work, that would be a huge stress and burden to all of those families. My family included.

17-390

Traffic safety on Lampson with this project is going to be critically low. The u-turns needing to be made, road rage it will cause, the cut-thru traffic into the neighborhood I live in is unwelcome. There will be extra cars with more frustrated drivers and that is a dangerous combination.

17-391

The Lampson Ave. is already a busy street that goes through many cities. It is heavily trafficked and does not need any more traffic. Especially right by our small neighborhood. It is NOT welcomed and will produce more pollution, car accidents, traffic, unsafe driving, and delay commutes for everyone.

17-391 (CONT.)

Youth sports at Heather Park and Arbor Park will be stopped during this project. AYSO soccer plays at Heather Park and your project will stop and relocate all of hose practices and games. That is a burden of time for all of those children and their families, please respect us local families and our time.

This is not a positive project either. The housing and population you want is completely unwelcome by my whole family and many of my neighbors and friends. Please do not do this project, please. My family is my world and my life savings have gone into our home. If you make our home a lower value from this project, we will be devastated. Please do not build low income homes there. We are a nice city with high property value that we paid for. We are good people with honest jobs, kids in school and pets in our home. My parents and grandparents live in college park East on Sunflower and on Ironwood. We live on Dogwood and cherish this small city and quaint neighborhood. Please do not put in low income housing on Lampson Ave. I beg of you. We do not want it. Please stop this project. We do not see any positives from it, and only many negatives that I have mentioned above.

I am writing to you about the Lampson Project. Even though I live in Huntington Beach, I use Lampson almost everyday to go to my daughter or my mom's house. I also pick up my grandchildren from a school in Rossmoor and travel to and from the school on Lampson. I am concerned about an increase in the traffic which not only includes many vehicles, but also more car noise, and traffic safety.

I am also concerned about the impact to the schools in Rossmoor. The possibility of more busses, cars, and pedestrian traffic will negatively impact the roads in Rossmoor. In addition, the schools will have the possibility of being overcrowded.

I respectfully ask that you carefully consider how this development project will impact College Park East, Rossmoor, and those of us who use Lampson on a daily basis.

Sincerely,
Debbie Ramsey

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender fredschutz@roadrunner.com

I am writing you to disclose how your Lampson Project will create a negative effect to my personal health. I have respiratory issues. As my backyard sits on Lampson, the dust during the construction will be intolerable. In addition, the dust from the additional traffic after the construction is complete will further contribute to my breathing issues.

Beyond my personal health, not one neighbor has welcomed this plan.

There is no plan for the increased traffic on Lampson. No additional traffic lights. No left turn signals. Cars traveling east will need to make U turns on Rose or Heather Street going west. It is likely these new neighbors will increase traffic inside CPE because Lampson was not designed for so much more traffic. And there is no plan for increasing lanes on Lampson. And even if there is, who wants to live behind a 6 lane road? It would be like living behind Beach Blvd.

17-397

The current level of noise is barely acceptable. When we bought our house, we were told the price was lower than the houses a few streets inside CPE because we were on Lampson, and it might be a little more noisy. Now that you are planning on having 550 cars (not to mention the guests of these new neighbors) in addition to what we have been suffering, I can only imagine how much more my home will depreciate, and how much more outside noise we will have to tolerate.

17-398

CPE has delightful little parks. Based upon the projected map of the project, there are no parks included. Which means we can expect to have a few thousand new neighbors overcrowding the small parks we have.

17-399

I haven't seen any proposal for additional fire or police. Even though our neighborhood will be increasing by several thousand people. Speaking of which, aren't projects like this one reserved for non-residential areas? Clearly one building does not define a commercial area.

What will happen when I can't even park in front of my house because there won't be enough spaces in the proposed development?

I do not feel a change in this community should be left to one investor or a few city managers. You have no right to affect my health or quality of life. At the very least, it should be put on a ballot. And not a Los Alamitos ballot, but a Seal Beach one.

Thank you for your time.

Regards,

Fred Schutz

I am a resident of this community. I grew up in Seal Beach in College Park East. I lived there for 4 years as a parent and am still in the area for community events.

My children do soccer at Arbor Park every weekend. My children play at Heather Park near your proposed project site.

I am very concerned about your proposed project will negatively affect our neighborhood. This is our community and I don't want to ruin our community and keep it true to our roots.

Please strongly consider my concerns for our community. I strongly oppose this project.

Dear Mr. Oliver,

Please see planning issues regarding the proposed Lampson property development below

Significant concerns are the loss of open space for wildlife and traffic impact with no alternative route.

Great Blue Herons, Great Egrets, Osprey, Hawks (several varieties) Barn Owls (protected), doves, finches and many migrating birds are all seen using the quiet lawn/redwood tree areas on the current California Dept of Fish and Game/former WestEd property.
This doesn't begin to consider the mammals and reptiles which use the site.

Los Alamitos has no other uncrowded open space area, epecially along this corridor.

17-402

The adjacent human population will also be impacted...traffic, no alternative route for College Park East, Parkewood Los Alamitos, West Garden Grove.Lampson, a curving 2 lane per side street, already heavily traveled, is the only access. This was especially evidenced in 1995 when drainage culverts overflowed in a dramatic rainstorm. Lampson was closed from Manley Ave in Garden Grove to Seal Beach/Los Alamitos Blvd in Los Alamitos. Many residents could not return home. This impacted nearby Rossmoor also, since many were stuck there. FEMA responded to the flooding.

I realize that my concerns, as a College Park East/Seal Beach resident, may be of little importance to Los Alamitos. I understand the federal guidelines for affordable housing are valid. However, to place so many with no major road access is imprudent. The area near Oak Middle School or the Los Alamitos race track could be considered since major streets are available.

Perhaps Orange County planners can be helpful.

Thank you for your attention.

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender jeffreycsmith32@gmail.com

Hello Representatives of Seal Beach and Los Alamitos,

I am writing this email to express my deep concerns about the Lampson Project. I have been a College Park East resident since 2016 and love the neighborhood that I have decided to raise my family of five in.

To start, I was born and raised in Los Alamitos (Suburbia Estates neighborhood) and graduated from Los Alamitos High School. I know and understand the deep connection between Seal Beach and Los Alamitos.

That being said, what I don't understand is how a housing development from one city (Los Alamitos) is able to have such a profound impact on the residents of another city (Seal Beach).

Such would be the case if this development comes to fruition. While there are merits to building residential housing, the size and stature, as well as the location, will have a detrimental impact to the residents and overall community of College Park East.

17-404

Here are my concerns that I would like addressed:

- **Traffic** - The number of cars on Lampson would increase exponentially. This is one of the main thoroughfares to get from Seal Beach Blvd to Valley View. If you increase the car population by hundreds, I believe traffic would get significantly worse. Additionally, the speed limit is 45mph and as you know, that is exceeded by a number of drivers. I believe my safety and the safety of my family and community members would be in jeopardy. I would like to get a report on the number of tickets that are written for speeding and to see if there is a higher percentage of tickets on Lampson than in other like areas. Additionally, I would like to receive a report on accidents along Lampson in relation to other like areas.
    - Traffic to and from school - As previously mentioned, I have a family of five (three children) who all attend schools in Los Alamitos Unified. I believe this development would dramatically affect my ability to get my children to and from school in a timely manner. Other than leaving earlier, which is difficult since my wife and I both work and have three children, what can you do to address this?
    - Only right turn out of the development - The fact that residents of this proposed development can only make a right turn (west direction) will lead to a traffic backup on Heather, the very street I take to enter my neighborhood. Many families in our neighborhood walk to Arbor to play AYSO and use the dog park and having hundreds of cars daily make a U-turn to then head east on Lampson creates a safety hazard. How do you plan to address this issue?
    - Emergency Response - this is a major sticking point. More traffic leads to a less

17-405

quick response and when you are dealing with emergencies and every second counts, this impact cannot be overlooked. How will response times be affected with this new development?

- **Parking** - The amount of parking spots in relation to residences for this new development is grossly under-represented. Additionally, the garage parking spots that are being allocated for the single family homes will not actually be used for parking, but instead used for storage, further reducing the amount of available spots. I live right off of Heather St. and know that from this development, the parking in College Park East will be 100% impacted, thus not allowing me to park within a reasonable range of my house. While the convenience of being able to park by my house is extremely important, it isn't actually the number one concern for parking. My number one is that with having our streets flooded with cars that do not live in the neighborhood, nor the city of Seal Beach, my children's ability to play in the streets would be negatively impacted. You may say, they can play at the park. Yes that is true, but not all games/activities can be played at Heather Park. My sons like to play roller hockey, basketball, and ride bikes (etc). They will not be able to do those things or at least not to the extent as they currently are able to.
    - With more people parking in our neighborhoods, I am fearful that our children, and even adults, will suffer from potentially being struck by cars pulling in and out. The stop sign on Heather and Hazelnut is routinely run. I know that because I see police by my house watching for that specific traffic violation. The law of averages suggest that with an exponential increase in traffic/parking, the risk of accidents (car to car and car to human) will increase. How do you plan to address this?
- **Recreation** - In looking at the plans, I see that the new development has a common area (open space). While common areas are nice, kids, especially little kids, will not find it all that attractive. There is currently no play structure at Arbor Park. The residents of this Los Alamitos Development will nonetheless use Heather Park as their "go to" means of recreational activity, thus overcrowding the area. Heather Park is already a very dated park and that will only increase with the amount of new individuals frequenting it. I know there are plans to rejuvenate Heather Park, but with an increase in hundreds of kids, the park and its new facilities will quickly wear, thus creating a less enjoyable experience and potential safety hazards. How do you plan to address this?
- Construction Noise and Road Closure - I chose to live in College Park East to provide a great quality of life for my family; having a development of this scale will surely impact our quality of life for a number of years. Construction has collateral damage. With the heavy machinery, road closures, workers coming to and from, the amount of noise, etc. will undoubtedly have a negative impact on my family and others in our community. How will this be addressed?

I kindly ask that you please reconsider this development and the negative impact that it WILL have on the residents of College Park East and the surrounding area. I will patiently await a response to my concerns listed in this email.

Thank you for your time and consideration

Jeff Smith

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender jengrahammd@gmail.com

To whom it may Concern,

I am writing in response to the proposed Lampson housing project.

My name is Jennifer Graham and I have been a homeowner in College Park East since 2009. I also grew up in West Garden Grove(right off Lampson/Valley View). I believe the proposed project will negatively impact the area. This will significantly increase the traffic on Lampson in both directions. Over the years, there has been issues with speeding, leading to terrible accidents on Lampson(some fatal). The timing of the signal at Candleberry has also lead to horrible t-bone accidents for cars leaving the neighborhood(it is a blind corner exiting the neighborhood with a very short transition from red on Lampson to green on Candleberry, Lampson drivers speed through the light). Also, on a busy morning for AYSO and the dog park, Lampson becomes dangerous due to increased traffic and people not knowing what driveway to turn into. The left hand turn into these driveways often spills out of the turn lane into traffic reducing it to one lane in the east direction.

17-409

My questions are:
1)Are additional traffic signals being planned?
2)Is the overflow parking expected to be College Park East? If so, is Seal Beach planning overnight permit parking only in College Park East?

17-410

3)Is Los Alamitos planning to compensate Seal Beach for increased use of its Public Services(i.e. police who patrol and investigate accidents on Lampson)? Will the Los Al police/fire departments be responsible for responding to incidents in the proposed neighborhood, and will potential tenants be informed on potentially longer response times due to distance from the rest of of Los Al?
4)How will this affect public utilities(especially in summer months)? Is the proposed project on the Los Al grid or Seal Beach electrical grid?

Thank you in advance for your attention on this important issue. I look forward to your response.

17-411

Sincerely,
Jennifer Graham M.D.

Hello Mr. Oliver,

As residents of College Park East in Seal Beach, we have concerns about the new housing development planned along Lampson Avenue in Los Alamitos.

As we're sure you've received many letters, we hope that the concerns are taken seriously. We understand that demands for additional housing are being placed on cities. That we have accepted.

Our concern lies in how the new development will negatively impact the quality of life for residents living in the surrounding areas. And in this scenario, it is hard to come up with a positive outcome for nearby residents in Seal Beach and Los Alamitos.

17-414

As plans are evaluated, please consider the following:

- Visibility: The 3-story portions of the development will be visible from homes. These buildings will not only be seen from people's front and back yards, but from inside the house as well. This seems like an unreasonable level of infringement just to be able to add density to a project that will end up having 2-3x the density of the surrounding neighborhoods. Please consider: (1) scaling back the height of the project or (2) including landscaping to help screen buildings.

17-415

- Traffic: This is a very real concern. Not only is the traffic on Lampson dangerous, but residents tend to use the inlets/outlets as an extension of Lampson. So not only should the traffic on Lampson be a consideration, traffic within the existing and proposed communities should be as well. Many will attest to the number of fatal and serious accidents along Lampson, and we too have seen the aftermath of many. Additionally, Lampson is the only way in and out of the neighborhood. Anytime there is an accident or nearby construction, traffic gets routed to Lampson, creating additional traffic. With the anticipated increase in traffic on Lampson, please consider: (1) adding signals (2) additional policing of the roads and (3) improvement of center medians to reduce risk of crossing across medians.

17-416

- Parking: This is something that we deal with already. What is the contingency, should the new development lack adequate parking for residents, roommates and visiting guests? Also, what happens during weekend soccer tournaments? There are currently times when people park in CPE on the weekends. Since we park our cars in our garage, we already know the frustration of empty curbs being filled by CPE residents with 4+ cars per household. Who wants a street lined with parked cars? Or without a place for guests to park?

17-417

- General overflow into neighborhood: The proposed community appears to lack many amenities that could improve the quality of life for the new residents as well as increase property values. There appears to be very little grass, no playground, and no sports courts (basketball, volleyball, etc.). As a community, how does that fit with the values of Los Alamitos? While it's speculation, there will likely be overflow into CPE for use of parks and dog walking.

  We are concerned with the additional CPE foot traffic and park use that will surely come as a result. Please consider: (1) Adding additional parks or greenbelts for people to relieve their dogs. (2) Some sort of playground equipment and courts for the residents of the community. Make it a community that is worthy of the values of the city. Not just another high-density project that will appease the state.

17-418

There are many other ways we believe the new development will have an adverse impact on the existing community, but we will leave it at these four. Please consider, seriously, all the concerns sent to you as many are rooted in safety and a reduced quality of life for neighboring communities. While we understand the state requires additional density, we believe cities need to push back in any way possible to make these new developments livable and reflect the standards and values of the community.

Thanks for your time and consideration.

Best Regards,

Valerie and Don Munro

Hello,
My parents moved to college park East when I was in 3rd grade. I lived here until I went to college. Then, when my husband and I had our second (of three) children, we wanted to move to a safe, quiet neighborhood and we decided to move back. We are completely against adding additional housing especially the volume currently projected. This will cause additional traffic and pollution. This will crowd our parks and our neighborhood with cars and change our quiet neighborhood. Our area is not equipped for this plan and will likely cause people to move out of our neighborhood.
Thank you for your time,
Rebekah Smith

Good Afternoon,
I am writing to you as a concerned parent, who, over the course of thirty-eight years living in CPE, has watched the traffic on Heather St become increasingly more congested and the drivers too become increasingly more dangerous. Please take the time to watch this phenomenon for yourselves at 5pm PST on ANY weekday. The parade of cars returning from work is seemingly never ending. And there, right on the side of the street, zooming down the slope (directly next to the mailbox) is your constituents on their scooters and skateboards. I know this because I used to skate that very same slope into the street. A collision is inevitable. Injuries TO KIDS is inevitable. The addition of residents to 'The Lampson Project' as they look for a means to park their cars and u-turn their vehicles will make this even MORE likely and MORE frequent. You have a chance to prevent it from happening.

17-420

I appreciate your consideration.

PS. I debated bringing this to your attention, but it too is a legitimate concern of mine, I am worried about the plague of gophers this project will unearth. I've sprained many an ankle in gopher holes way too many times at WestEd. Im mortified at the thought of how many gophers are living under that grass. Where will they relocate to?

17-421

To Whom It May Concern:

I am writing regarding the Lampson housing project. My understanding is that this will create a total of 246 housing units for 800+ residents. I am extremely concerned that this development would create more traffic on Lampson, which is already congested during rush hour. Lampson is the only street College Park East residents can utilize in order to get to the freeways and adding so many more residents would only increase traffic on the street.

17-422

I recently moved to College Park East from Los Angeles and one of the main reasons for moving down here was to live in a safe neighborhood where our children can ride their bikes or walk around without constantly having to worry about getting hit by cars. I am worried that more cars would be on the road putting our children in danger. Additionally, more people would mean more cars and more cars would lead to more pollution and noise.

I hope you take these areas of concern from the residents of College Park East before proceeding with the project. Please let me know if you would like me to address any other concerns. Thank you for your consideration.

17-423

Please consider all the traffic for lampson. We are very much against a large development that this was not zoned for. Seal beach Blvd is already too crowded and this will even cause more problems. Can our schools handle all of this too? Our college park neighborhood doesn't want the traffic it will cause either! I know California is working to provide housing but this high density hurts everyone. We did not pay high housing prices to have this happen to our area. Do we have enough emergency services, parks, libraries, schools? I hope the community is more important than developers making a lot of money. Please consider all of this in your plans. Thank you. Dear City of Los Alamitos,

As a resident in College Park East in Seal Beach for over thirty years, the planned development north of Lampson causes me great concerns.
1. Lampson Avenue is a heavily traveled thoroughfare from West Garden Grove to Los Alamitos/Seal Beach. Adding this number of housing units/residents to the area north of Lampson Avenue will only exacerbate an already congested street. There does not appear any access to the proposed development other than off of Lampson.
2. Parks and open spaces add to the quality of life. This proposed development does not add additional parks and diminishes open space.
3. Should this proposed development come to fruition, the traffic density on Lampson at peak times will lead to the use of College Park East residential streets (i.e., Ironwood and Hazelnut) to be used by drivers as alternate "cut through" routes to avoid Lampson traffic.
4. While there may be plans that I have not seen, what resources in terms of fire and police service are included with this proposal?

I would like to request the results of an environmental impact / technical studies regarding how the proposed development will impact the area.

Please reconsider how this development proposed by the City of Los Alamitos will negatively impact their neighbors in College Park East (Seal Beach), West Garden Grove, and Rossmoor.

Sincerely,
Gregg Stone

To whom it may concern:
I am a resident and home owner in Los Alamitos. I have three young daughters, all active in AYSO soccer, which utilizes Arbor Park for practices and games 3 times a week (each child!) during the Spring and Fall seasons. Arbor Park is one of the only parks in Los Alamitos large enough to accommodate the cities youth sports, such as AYSO. Additionally, the parking is already an issue during the soccer season. Fish and Game has generously allowed the use of their parking lot to accommodate parking issues, but what is this going to look like when this new development comes in? Has this been taken into consideration?

17-426

My concerns specifically are with:

Aesthetics
Construction Noise and road hazards
Land Use & Planning
Noise Pollution (vehicles on Lampson)
Population & Housing
Parking in our neighborhood
Recreation
Road impacts from heavy equipment
Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc)
Views from our backyards

Please stop this development lampson street is already over crowded and hundreds of animals are being killed on a yearly basis this will only make things worse we have to remember we've taken away all the nature from the creatures around our area please do not take more they need a place to live as much as we do also both my grandparents died of lung cancer from the carcinogens neither of them smoked a day in there life just from the traffic from the freeway alone let alone another 500 cars a day on Lampson It will put my family at risk as well the noise from traffic is already almost forcing me out on lampson this area used to be the most Desired place to live now alone with the added traffic from the freeway construction and new phone apps that take people around traffic we have enough as it is you're bringing the property value of my property down

Opposed to the Lampson project, housing development.

I've lived in Seal Beach off of
Lampson for more than 25 years and have enjoyed our neighborhood.

This would lead to more traffic on Lampson in addition to more accidents on Lampson. Alot of parking congestion in addition to more noise pollution, construction issues, poorer air quality, crowded parks, more crime to our vehicles and our homes,, more vehicles in our neighborhood, lower house values, and more rodents due to construction and hurt the aesthetics we have known for many years.

Please consider stopping the Lampson Project.

Thank you.

From: Marjorie Morley, Dogwood Ave CPE

Aesthetics- As a resident of CPE for 20 yrs I purchased my home because of the beautiful drive down Lampson which will be forever changed with this new development. No more country setting! Will be too city-like!

Air quality is already bad with constant 405 widening! This area already has a bad AQMD rating. I have constant black dust in my house. Driveway & pavers also black when rinsed down. It will only be worse with pollution all around our tract.

Construction Noise and road closure -Too much traffic & accidents without the increased amount. Lampson is a speedway as is. Years of accidents will now increase. Noise of medical vehicles will be the norm.

Fire / Police / Medical Response-Will it be Los Al located? Not use SB city services.

Greenhouse Gas Emissions- Will the development be built with with Green Emmisions in mind?

Hazards & Hazardous Waste- Hopefully up to code &`properly stored/disposed of!

17-431

Land Use & Planning- Hopefully the beginning of this deveoplment will be set back away from the street! Worried about my property value being decreased. Katella developments are enough & ugly looking driving down that street. A mish- mash of looks! I don't want our area looking commercialized.

Noise Pollution (vehicles on Lampson) And how long will this development take from start to finish? Like years?

Population & Housing- Will the new tenants be told of the noise they will have from the Joint Base, eg: helicopters taking off & landing frequently, training sessions, air show yearly. Those planes rumble my house while they practice. Noise level high. Still too many people in a small area.

Parking in our neighborhood should not be allowed in CPE or use of our parks. Don't want dogs polluting our common areas. Want a protocol fir eliminating this problem.

Public Services -Street sweeping & trash pickup will add to noise & pollution. Maybe rodents & such.

17-432

Recreation- should be contained within the new development.

Road impacts from heavy equipment- what will Lampson road condition look like. Will we get flat tires from construction debris. Have to dodge construction debris & be involved in an accident. To the new tenants. Driving from Valley View is very dangerous during the time the sun is at its worst location & you can't see what's coming down the road.

Schools / Libraries- Can Los Al handle an increase in students?

Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc) Just increased incidents off accidents.

Taxes- Hope this development doesn't effect any of my already high taxes.

Utilities & Service Systems Will all be underground & out of site?

Views from our backyards- Im sure those houses on Lampson will be affected. Those on corners(Rose) more so! Glad I dont live close to Lampson

This new development will change the lives of the entire CPE community! And not in a positive way!

Mr. Tom Oliver,

I have several questions and comments on The Lampson Project proposed in Los Alamitos:

Site Access- Can the project utilize the existing traffic signal at Rose Street by acquiring needed land from the Navy Golf Course to allow a full access entrance at the existing signal- much safer for everyone.

Left turn access at the proposed east entrance- is the proposed left turn lane long enough to handle trips/stacking distance for PM peak hours?

Vehicles exiting site and wanting to travel east have to either make a dangerous left turn out across the WB lanes and incoming EB left turn or go west and make a u-turn at Heather Street- can the WB left turn lane at Heather Street handle all these u-turns (length of left turn lane and traffic signal timing)? Is there an impact at this intersection (Lampson and Heather) due to more than 50 trips in the peak am or pm hour?

17-435

Isn't the proposed west entrance too close to the existing driveway to the dog park/soccer fields (200feet)? The WB left turn lane at the entrance to the dog park/soccer field is only 40 feet long and results in vehicles entering the left turn into the dog park to back out into the EB thru lane.

WB vehicles entering the west entrance turn right from a 45 MPH travel lane into a parking lot that has vehicles possibly backing out of a parking space directly into the entry drive aisle and possibly causing a collision between a car entering and a car backing out of their parking stall. Possibly require a deceleration lane into each/both entrances for WB traffic. West entry should have a sufficient throat distance to allow vehicles to enter the site while safely getting out of the WB lane of travel, without possibly encountering a vehicle backing out or parked in the drive aisle.

17-436

What are the regulations that govern development adjacent to the Joint Forces Training Base (JFTB)?

What are the regulations that govern the Airport Land Use Committee regarding JFTB and proposed developments adjacent to the JFTB?

17-437

What is the impact on Police and Fire response for Los Alamitos emergency programs? I assume the existing Federal building pays zero property tax to Los Alamitos; does property tax on proposed housing units pay for emergency services required? Roof tax = community facilities district to offset financial impacts to city?

17-438

Is the developer proposing financial assistance from the Statewide Community Infrastructure Program (SCIP) or another financing mechanism and/or eligible for other subsidies for housing projects to entice home building and address Los Alamitos' Regional Housing Needs Allocation (RHNA) requirements?

Will the cost of private and public improvements be financed by a community facilities district/Mella Roos Act in effect and passed onto the future home buyer?

17-439

Are internal drive aisles wide enough for fire apparatus/vehicles and are there sufficiently sized vehicle turnaround areas for large fire vehicles?

Are internal streets/drive aisles private and privately maintained or public and City responsibility? Will parking be prohibited on internal drive aisles to maintain proper clear space for emergency vehicles? Emergency vehicle access easements?

17-440

Does Los Alamitos have a tree ordinance regarding mature trees on a development site?

17-441

How is the impervious surface area proposed to be treated to meet water quality requirements for priority development projects?

17-442

Is the project requesting a parking concession due to the project providing affordable housing? Where will the project residents park when there is no parking left on site? Will they park on College Park East streets and cross at the Heather and Rose Street intersections and/or in between the signals on Lampson?

17-443

Are proposed Green House Gas emissions significant and/or unacceptable for this change in land use designation?

Thank you for the opportunity to comment on the project and I look forward to your response.

Bob Moehling

To whom it may concern,

I am writing in protest of the plan to build a 500 unit complex off Lampson Blvd by the Navy Golf Course.

17-446

This area cannot sustain the congestion of cars this would create, not to mention, The safety of the bicyclists that use Lampson on a regular basis.

The noise pollution and major impact of the surrounding neighborhoods would become high. There would not be enough park space for all the people that would be moving in. We regularly use the dog park and area next to it which would be taken away.

17-447

What would happen with the wild life and Rodents that occupy that area? How would there be a guarantee this would not spill over to the neighboring area?

I have lived in this area for over 15 years and do not want to have to watch how this would destroy this area.

I ask that this be stopped..

17-448

Best regards,
Sarah Kennedy

17-449

Please reconsider the development planned for Lampson in Seal Beach. Adding this community would negatively affect Seal Beach, Los Alamitos and Rossmoor.

First, our schools are already overcrowded and by adding these additional homes and apartments will only add to our current problem. Have you visited the high school recently and seen the amount of portable classrooms they currently have? Have you heard of the parking issues for students at the high school? I think it's important that you address the community and let us know good plans for how the school district will plan for the additional families moving to the neighborhood.

17-450

Also, the increased traffic on Seal Beach Blvd / Los al Blvd during the morning and afternoon hours will be horrible. Try driving to the high school at 8:00 am any Monday through Friday and then imagine adding an additional 100 families to the neighborhood taking that same path.

Our small community is built with one major roadway and by adding these additional homes you will drastically change the lives of current community members for the worse.

17-451

Ryan Marshall
Resident of Rossmoor for the past 16 years.

Good morning Tom,

The tone of my comments may overshadow the message. I would like to amend my comment to the following extent:

Please delete the last paragraph of the email I sent to you. I think the first paragraph I wrote conveys the message clearly. The last paragraph begins with, "Many of the residents…." Please delete this paragraph.

Thank you,
Nick Papadakis

The developer is required to review each Environmental concern.

They are counting on us not saying anything and breezing through the process.

Now is our time to stop this. Mention as many examples and be specific in asking for environmental/technical studies.

Please be generous when providing examples of how this project could negatively affect our community. Some examples are below, and don't forget to include your name, address, and contact information!

Aesthetics
Air Quality
Cultural Resources
Construction Noise and road closure
Fire / Police / Medical Response
Greenhouse Gas Emissions
Hazards & Hazardous Materials
Land Use & Planning
Noise Pollution (vehicles on Lampson)
Population & Housing
Parking in our neighborhood
Public Services
Recreation
Road impacts from heavy equipment
Rodents
Schools / Libraries
Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc)
Utilities & Service Systems
Views from our backyards

17-453

Low income housing may include Section 8 government supported housing. Unfortunately there is a high incidence of crime associated with Section 8 tenants. Whether the proposed housing is Section 8 or not, why would any responsible city government permit low income housing to exist adjacent to relatively low crime neighborhoods such as Los Alamitos, Rossmoor, Seal Beach? Why would a responsible city council permit such an element into this area? Nonsense.

17-454

Many of the residents of this area own fire arms for good reason. Crime is rampant generally. People own fire arms for personal protection because the police have been hand cuffed. Imagine turning loose a low or no income population in the streets of the areas mentioned above. Such people are looking for opportunities to steal and maybe worse. Guns will be used.
Does the city council want gunfights in the streets? Keep the undesirable element away from this area. That is part of your job as public officials. As public servants you should protect your constituents from crime we see on TV occurring in other cities.

We have lived in College Park East for over 27 years. Our daughters went to McGaugh Elementary, McAuliffe Middle School and Los Alamitos High School. Our nice, quiet, peaceful area is going to be ruined by overbuilding on Lampson. I saw this happen when they tore down the movie theater on Seal Beach Blvd and put in more shops and stores and built The Target Center across the street. They have overbuilt and that brings more traffic which causes more car accidents just in sheer volume alone. They are ruining the area with over building and making it turn into a miniature Los Angeles. We moved to this part of Orange County to escape the LA congestion and traffic and if this project goes forward we will be truly following in the footsteps that have made living in Los Angeles a nightmare for so many. Either stop the project altogether and leave the open space on Lampson as it is or scale back the project in a huge way. Otherwise our beautiful small town will truly turn into Los Angeles. It is already heading in that direction, judging by the construction on continual construction on Katella.
Thank you for listening.

Sent from my iPhone, please excuse any typos

Dear Los Alamitos City Council,

I am writing to you as a College Park East resident who is concerned about the proposed project at 4665 Lampson Avenue. After reviewing the plans, and discussing some of the details with neighbors, it appears that the project developers have underestimated the potential negative impact on surrounding communities regarding traffic safety, parking, and quality-of-life issues. One project design aspect that I find concerning is that the housing development will only have two entry points (right hand turns essentially), if traveling west on Lampson Ave. towards Seal Beach Blvd. The lack of additional entry points will result in drivers making dangerous U-turns near Heather Park. As College Park East residents know, the section of Lampson Ave. between Heather and Tulip already experiences numerous auto accidents—many involving U-turns. Likewise, this project design issue will result in increased traffic on residential streets closest to Lampson. Streets such as Ironwood, Hazelnut, and Fir Ave. will experience more usage as Lampson Project residents attempt to bypass congestion and access their homes and apartments using alternative routes. This type of increased traffic on residential streets will not support the peaceful and safe environments that residents have come to expect in communities such as Los Alamitos and Seal Beach. 17-458

With a housing development that will include 240 units, many with multiple tenants, the issue of parking availability has naturally caught the attention of College Park East residents. While the development firm has included parking availability in their proposal, the number of spaces does not realistically meet the potential need. According to the most recent numbers for the project, a total of 557 parking spaces have been allotted. 459 spaces are connected to the cluster homes and townhomes; while 98 are associated with 77 multifamily apartment homes. At first glance this might seem like enough parking spaces for the number of proposed units, but many of these spaces are confined to traditional garages. As many of us know, garages are often used for household storage purposes and quickly lose the capacity to house even a modestly sized car. Also, 98 parking spaces assigned to 77 multifamily apartment homes will most likely be insufficient to meet the needs of families who own multiple cars. Given these problems, a likely outcome would include Lampson Project residents parking on nearby residential streets. With many College Park East streets already lined with the cars of its own residents, any additional cars would be difficult to incorporate without feeling a sense of parking overflow. 17-459

Even though the proposed project is a matter primarily for the City of Los Alamitos and its representatives to decide, I believe it would be short-sighted to ignore the historical ties that exist between the communities of Seal Beach, Rossmoor, and Los Alamitos. Our residents share schools, parks, libraries, and other public spaces. Our children have friends in these communities, where we socialize and patronize local businesses. With this in mind, I hope the leaders of the City of Los Alamitos will recognize and strengthen our collective well-being by taking into consideration the safety and quality-of-life issues at stake for their College Park East neighbors. More specifically, I would like to see the City of Los Alamitos (and surrounding cities and related public entities) initiate further study as to how the proposed Lampson Ave. development will impact use of public resources. As someone who regularly visits and supports our local public libraries with their children, I wonder if adding 240 units of housing will place an undue burden on the OCPL branch libraries in Rossmoor and Garden Grove. Also, as someone who regularly visits Heather Park, Arbor Park, and other local public parks, I question whether these locations (which are in states of disrepair) can accommodate new groups of families and children safely. I believe only further study can answer these questions and put the minds of College Park East residents at ease. 17-460

Sincerely,
Tim Ream

To whom it may conern,

As a College Park East resident i have the following environmental concerns with the intended proposal:

Construction Noise and road closure (Lampson ave) during construction period.
Overflow Parking in CPE.
Road impacts from usage of heavy construction equipment.
Traffic Safety (u-turns at heather, left / right turns at Seal Beach Blvd and Valley View, cut through traffic, etc)
Noise Pollution and overall traffic impacts due to excessive amount of vehicles on Lampson.
Public Services/Recreation: Parks (Heather Park usage)

Dave

I am writing as a concerned resident of Seal Beach with respect to the new housing development project on Lampson Avenue. I would like to request environmental/technical studies to address the issues listed below.

I am especially concerned with the traffic disruption of the only street that provides access to College Park East. The morning traffic around school times already cause large backups and with added housing will magnify the impact. Additionally, Lampson is a street that causes violent car accidents with vehicles traveling at high rates of speed. Having new access points directly entering Lampson that are heavily used by residents will create many new violent accidents.

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender marendermody@gmail.com

To Whom is May Concern:

My name is Maren Jackson and I live at 4557 Ironwood Ave. in Seal Beach with my husband, six year old daughter and two month old son. I can be reached via email or on my cell at 760-604-0404. We just recently learned that there are plans to put a 240 unit complex almost directly behind our home. I am extremely troubled by this news. Further, there are so many unknown factors related to how this construction will affect the environment, the rodent issues, the visibility into our backyard, the increased traffic behind our home, and more. 17-464

What studies/projects have been done to assess what the effect will be for the local residents? In the city my parents live in, they put up a small flag to the height that the proposed construction will be so that local residents can see how their property will be viewed by the new build. Has this been done? Further, we have a terrible rodent problem in this neighborhood and this construction and displacement of these rodents will only cause an influx of them in our neighborhood.

I am also very concerned about traffic, noise, hazardous materials, thr lack of parks in the community causing the 240 units to use the local neighborhood parks, accidents and the environmental impact. What has been done to asses these? 17-465

Please advise ASAP at the contact info listed above.

Hi City Staff Members,

Please stop the Lampson project. This project unfavorably impact our kids future with more traffic, cars and reduce the parks and open green spaces per person. This new housing will make Rossmoor, Los Alamitos and Seal Beach less desirable places to live and have a long term unfavorable impact on house prices (less taxes for the city in the long term).

Other unfavorably impacts are:
Poor Aesthetics
Worsening Air Quality and Greenhouse Gas Emissions
Increasing Hazards & Hazardous Materials
Increasing Noise, Population & Housing

Please stop this project for our kids' future.

Thanks,

Gizem Gulec

To politicians and city officials behind this proposal,

You are proposing to destroy a community with your greed.

In return, you will destroy the aesthetics of such green space with nice family neighborhoods around it and more importantly worsen the air quality which is already unhealthy due to existing traffic.

We just went through the worst pandemic, that will have long term impact on our children's health, and your proposed project will cause more respiratory issues, potentially lead to mutations and much serious respiratory diseases. CDC already published their opinion on the long term impacts. You would be guilty even proposing this development

Moreover, you are proposing an attack to our culture and livelihood here. You are proposing to destroy decades of unique tradition and culture

We, including our children, will never forget you, politicians and investors, who are behind this terrible proposal.

You are proposing to benefit a 'small group of people', financially, and they are not even the future residents of the proposed development.

If you are with the people of your city, you withdraw this proposal. Then you will have our support, otherwise we will never give up

Hello,

I live in College Park East at 4748 Fir Ave.

I am incredibly concerned about the planned high-density housing development in the works and the impact it will have on our environment, traffic, recreation services and noise levels in the area.

We have spent countless hours in the area watching birdlife and animals in the open green space. The elimination of the field along lampson will be a huge loss and feeding ground. The elimination of parking and park and drive lot will be incredibly difficult for AYSO members and dog park goers.

17-468

We already experience a high level of traffic along lampson due to the size of the neighborhoods. Adding up to 500+ cars to the neighborhood will become incredibly problematic from spill over parking coming into the neighborhood and backup coming in and out of Lampson (the only way to get in and out of the neighborhood).
Explain how this project will negatively affect our community.

The huge appeal of this neighborhood is the quiet atmosphere which will be greatly hindered by the addition of over 200 new homes and large increase in vehicle traffic.

Don't forget to include your name, address, and contact information!

Please do not ruin this beautiful natural environment and impinge this neighborhood with increased safety risks with such a huge volume of traffic in a small area.

17-469

Sincerely,

Angela Lyons
805-573-0765

Hello Tom,

We are against this Project because it will have significant impact on environmental resources, and it will disturb our quiet and green community.

This project will help in the increase of Greenhouse Gas (GHG) emissions within a local area of the project. Some construction work may result in the exceed of some hazardous waste thresholds established by the California Code of Regulation (CCR) and may produce toxic fumes when heated which is very dangerous on Health.

Some soil disturbance may result in Aerially Deposited Lead (ADL) which is very contaminated substance and toxic to human health. Soil disturbance also may result in toxic dust.

Please keep our community safe, sustainable and green to enhance our health and livability.

Regards,

Abraam & Mirna

Dear Sir,

I am writing because I have been worried ever since the Lampson Project came up, even though I am happy to see this parcel used for badly needed housing.

But I am not happy about the planned density. I would like to believe that the plans can be reworked to include more parking and a playground for children so that CPE is not used for those needs by default.

We already have parking issues ourselves because few people use their garages for parking cars -- a practice I fear the new residents there will follow as well.

And I hope children will not be tempted to cross dangerous Lampson on their own to come to Heather Park.

Lampson is already known as Death Alley. I hate to think what the added traffic will mean. Are there any plans to mitigate this problem?

Thank you for considering my comments.

To whom it may concern,

The Lampson Project is a bad idea. Lampson Avenue serves three communities—Los Alamitos, Seal Beach, and Garden Grove— as well as several dense housing areas between Seal Beach/Los Alamitos Blvd and Valley View Blvd.

Adding more homes, cars, and people to this family residential area will create traffic issues severely impacting our commutes to work, school, and local shopping. It will negatively impact our quality of life by overcrowding the area causing increased noise and traffic, and stressing local utilities and service systems. Furthermore, Lampson Avenue is a busy roadway where there are several traffic accidents each year, some being severe. If more housing is added along Lampson, there will likely be more accidents, making an already existing issue worse.

17-472

Los Alamitos already has several mixed areas of housing that include apartments, condos, duplexes, and single family homes. The aesthetic quality of those areas is poor and demonstrates poor planning. The housing along Lampson Avenue currently makes up a nice family housing area. Please do not make the same mistake by making this a mixed housing area too. It will change the feel of the neighborhood and cause our home values to decrease//diminish. And it will diminish the Lampson corridor's reputation of being a desirable residential area.

Lampson avenue is an important thoroughfare for several communities. What you choose to do with this project goes far beyond the borders of the city of Los Alamitos. If you want more housing to increase your tax base, annex Rossmoor, which is an unincorporated area of Orange County and a community already using school district and community resources. That would be far less expensive and more profitable for our city.

17-473

Please be a good neighbor to us all.

Sincerely,

Lorna Cloke

I am very concerned about the impact this planned community will have on our existing community, including Los Alamitos, Seal Beach, Rossmoor and West Garden Grove.

Traffic in the mornings is already tremendously busy on Lampson. Adding several hundred cars a day will only increase congestion, noise, pollution, and accidents.

There does not appear to be adequate parking within the proposed developments and I fear the excess parking will fill into Arbor Park and across the street into College Park East.

17-475

Additionally, there are over 1000 families that are involved in AYSO Region 159 soccer every year, the organization plays and practices at Arbor year round and they use the Existing parking lot to provide parking for games and practices at Arbor.
With the proposed development, AYSO will lose 350 parking spaces, meaning hundreds of cars will have to park across busy and dangerous Lampson into College Park East creating a parking nightmare and dangerous street crossing for parents and small children.

Additionally, there is no playground for all the new residents, meaning they will also be regularly crossing a busy Lampson road and inundating Heather park with families.

I strongly oppose this project.

Justin

The Lampson project is a very big concern not only for the residents of College Park East but surrounding communities. Lampson Ave is already prone to problems and the addition of 240+ units would make it worse. Unfortunately with the way College Park East was designed Lampson has very little clearance for residents coming out of the neighborhood to see oncoming traffic which results in accidents. The development of so many new units would impact the street of Lampson even more. I grew up in Rossmoor and now live in College Park East. The speeding down Lampson was always a concern and I remember those boulders/rocks being put into the center dividers to prevent speeding cars into oncoming traffic (or at least that is what I was told). What is the City of Los Alamitos going to provide to better this street? There are no turn signals at the lights except where old ranch country club is and the major cross streets, the streets flood and the speeding is always a problem. The traffic at Seal Beach Blvd. and Lampson is already bad and with additional housing this is only going to be a nightmare to try and get kids to school on time! Also what parks are these residents going to use? College Park East's parks, which was even a fight to get in the development to begin with?Where are residents going to park? There is not enough parking with what is proposed and there is no parking along Lampson. Are they going to park in the tract of College Park East where parking is already limited. The residents of Parkewood in Los Alamitos already come into College Park East to walk their animals since Parkewood does not allow animals in the common area. Is this going to happen with this new development too? What about Arbor Park and AYSO soccer that benefits the kids of Los Alamitos, Seal Beach and Rossmoor? Where would anyone park? I am all for making a better and inclusive community but within reason and to benefit all the residents/surrounding residents not just developers and cities pockets.

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender jkirby@tfpgroup.com

This project directly threatens the quality of life of everyone in College Park East and surrounding West Garden Grove and Rossmoor. While we are in Seal Beach, we directly face the proposed project, as you know, and would have to share the already busy Lampson Avenue with over 500 new vehicles daily. Not to mention bringing this many new residents and cars to one of the busiest freeway intersections in the country.

Lampson cannot accommodate this traffic, and the project as proposed does not include enough parking for the proposed # of housing units and guests. There is no place for anyone to park other than in College Park East (CPE) when the new neighborhood fills with cars.

CPE has already been encroached upon by the 405 freeway expansion. This proposed development also negatively impacts this quiet neighborhood where some residents have lived their whole lives. My parents were original owners, and my mom is in her 3rd home in CPE. Many current residents returned here to raise their families in the neighborhood they grew up in, myself included, not to raise their families in what will become an overflow parking lot for the City of Los Alamitos.

17-479

The initial negative impacts that are apparent include:

- The noise, dirt, and traffic caused by the construction itself
- The lack of adequate parking - leaving the new residents nowhere to park but across an already busy street and in the CPE neighborhood
- The dramatic increase in traffic will contribute to poor air quality, increased noise, increased commute time to school and work, and increased chance of accidents on an already dangerous “Lamspon curve.”
- An increase in illegal parking and u-turns on Lampson, which would also endanger the lives of the many active residents in CPE who exercise along Lampson
- Overuse and overcrowding of the parks in CPE, which are maintained with City of Seal Beach tax dollars
- The influx of new residents that will overflow onto the already busy Seal Beach Blvd and Valley View (to the west and east) will severely overcrowd the surrounding areas
- An increase in crime – within CPE, we already see an increase in car break-ins and non-residents trolling the streets in the late night hours; adding to the volume of homes in

17-480

close proximity will provide a bigger target for criminals. The proposed high-density housing plan is an easy target for these criminals to be in and out and jump right across the street to CPE

17-480 (CONT.)

None of the plans we can see, or have been shared to date with the public, have improvement plans for Lampson, additional ingress/egress for the new residents that could avoid Lampson, or any consideration for the neighboring community. No proposal to provide funding to make CPE a gated community to secure us from the public parking fiasco this project will create. No consideration for this community in the planning at all.

We have always considered Los Alamitos, a good neighboring community, and this blatant disregard for the CPE community is disheartening.

While we all grew up with "SWRL," no one expected the land never to be developed. But the proposed plan is unreasonable, overreaching, and unduly burdens the residents of CPE.

I urge the City Council of Los Alamitos to work with the developer team to modify the proposal. To eliminate the negative impact on CPE and create a quality of life for your new residents that does not diminish the quality of life for CPE residents in any way.

I urge the City Council of Seal Beach to stand up for its CPE residents to the fullest extent possible, including legal action if necessary.

17-481

Thank you.

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender mrush2827@yahoo.com

Good Morning,

My name is Matthew Rush and I currently live at 4564 Ironwood Ave in the College Park East area of Seal Beach. I email you to voice my concern of the effects the Lampson Project will have on not only College Park East but surrounding neighborhood as well. My wife and I purchased this home just over a year ago in the hopes that it would be a place we could really lay down roots. We had a baby on the way who is now 1 years old and felt like this was the perfect neighborhood to start our family. A hidden gem in a beautiful city that is safe and family oriented with many like minded people. We, like many others in recent years, paid we over asking price in order to get into this prestigious neighborhood. The Lampson project counteracts many of the great values of this neighborhood. I have been a firefighter for the city of Los Angeles for over 8 years and have seen first hand what a large housing project can do to a small, safe, family neighborhood. The most obvious problem is the traffic. Being that Lampson is the only way in or out poses a glaring traffic issue not only in regard to congestion but also in accidents. If you have ever driven Lampson in this area you know that there are a lot of blind turns and cars seem to like to drive very fast. Recently there was an accident near the intersection of Heather and Lampson closing traffic in both ways for nearly all Lampson from Seal Beach Blvd to Valley View. This type of accident, with the addition of 200plus more homes would pose a chaotic problem. The addition of this many home/tenants/cars seems grossly irresponsible to those who live in the neighborhood. Additionally, the proposed family gathering area for such a large complex is unrealistic to say the least and will do nothing more than flood a Heather Park that is outdated and needing of upgrades. A Heather Park that is the main gathering area of a community, the epicenter of family and community gatherings (ie Christmastime, movies at the park, Halloween, Etc) with one portapotty for an entire neighborhood is borderline gross negligence. The idea of cramming more people into our parks is a recipe for disaster. The project plans also lack sufficient parking for the new housing. Most families do not have the space or luxury to be able to park one, let alone multiple cars in the driveway/garage resulting in mass street parking. Being that there is no parking in this new complex poses yet another problem that will soon become College Park East's. Crossing the street will be the only way tenants and visitiors of tenants will be able to park their car leading me to my last and most important issue, safety. I'm sure whoever reads this can agree safety is the biggest factor for moving to a neighborhood. As the father of a 1 year old it would be irresponsible and ignorant to think that this housing project would have no effect to the safety of my family and my neighborhood for reasons I have already discussed. Traffic, overcrowding and an influx of people parking in our streets pose an immediate threat to our safety as well as our current way of life, and our home value. If this were just a matter of changing our day to day a bit this would not be something the community would feel so strongly about. I hope that you can see, because it is so obvious, that this is so much more than that. I appreciate your time in reading and allowing the community to voice its concerns.

Hello,

My name is Luie Rodriguez, I live at 4580 Ironwood Ave. Please DO NOT approve the housing project being considered off Lampson and Rose.

The impact to our wonderful community would be upsetting to say the least. Not to mention how it would affect the safety of our children and general population.

I plead with you to reconsider as this would be a great detriment to the fine residents CPE and West Garden Grove.

Thank you for listening and I am available to discuss further if you wish.

Regards,

Luie Rodriguez

One of the reasons I moved to this area was due to abundance of space and beauty this neighborhood has to offer.

I can't even stomach the idea of all that housing and traffic it will bring. This city in the past few years seems to only care about the mighty dollar. I understand that money brings wealth but to what expense.

Please don't move forward with this disaster. It really will be a huge disaster. Please think of your community, not the money. Please put us first.

Good evening,

My name is Amira Michael. I live in Birchwood Ave, Seal Beach and I strongly believe that this project will bring nothing but chaos to CPE, Seal Beach city and all the neighboring cities. This project will bring more traffic than it's already congested on our everyday life. I already have hard time driving through Lampson during rush hours with the amount of residents we have now. The schools are crowded with large numbers of students, our parks will also be taken and used by others. Lastly our safety will be jeopardized. Please stop this nonsense greedy project and protect our Seal Beach beautiful city.

17-490

Other things affected by this nonsense project:
Aesthetics
Air Quality
Cultural Resources
Greenhouse Gas Emissions
Hazards & Hazardous Materials
Land Use & Planning
Noise
Population & Housing
Public Services
Recreation
Transportation & Traffic
Utilities & Service Systems.

Amira Michael

To whom this may concern,

Writing to voice concern for the Lampson Project. Please stop the project.

We believe this will negatively impact our community where were are raising our three young children by:

Creating overpopulation in this small, safe area. Overstress the resources. Creating massive traffic and access issues to/from our home.

17-492

With Gratitude,

Tim Sams

Dear Mr. Oliver,
I am writing to you to express my concerns over the Lampson project. There are many concerns regarding this project that are alarming. We are already challenged with medical response times and medical facilities are overcrowded. Adding additional volumes to this already overburdened system is very concerning. With the increased traffic that would be forced to use Lampson and make U-Turns at Heather Street only increases the risk for serious or fatal accidents. The lack of parks and play areas will overcrowd Heather Park which is already undersized for the CPE community. 17-493

The other area of concern that I have is related to the increased traffic. Lampson is the only street that connect to Seal Beach Blvd. this is the only access to all of the elementary schools that will be affiliated with this project. The traffic in the mornings is already very hectic and backed up on Lampson every school morning. Adding all of these additional residents would make it impossible to turn onto Lampson from Heather or Candleberry. With all of these additional vehicles I would request that an environmental study be conducted to see what the true impact is, not only with traffic, accident risk, but also emissions. Thank you for taking the time to read my concerns. I am very passionate about my community and am very concerned about the harm this project would cause to the community that I serve. 17-494

Thank you,
Heath Creighton

Mr. Oliver,

I am concerned about the housing project the City of Los Alamitos is considering along Lampson Avenue. While it will not directly impact the residents of Los Alamitos, it will heavily impact those who live in the adjacent area. I am requesting environmental/technical studies address, at a minimum, the items listed below.

1) Traffic on Lampson. Lampson Ave is already busier than usual with those who use Lampson to bypass the freeways. This will not be alleviated with the addition of toll lanes. Lampson is also already busy during peak hours with parents taking their kids to school.

2) Traffic Safety. U-turns at Heather St. are already an issue with users of the Arbor Dog Park. A community of the planned size will create additions traffic hazards.

17-495

3) Noise Pollution. Additional vehicles along Lampson will create additional noise at all hours of the day for the surrounding community.

4) Air Quality. Additional vehicles along Lampson will create additional pollution in the surrounding community.

17-496

5) Parking. Enough parking needs to be provided for residents and guests such that they do not impact adjacent non-Los Alamitos neighborhoods. These roads are maintained and monitored with non-Los Alamitos funds.

17-497

6) Environmental Drainage. Parts of Lampson are already subject to flooding when there are heavy rains. This development could cause more run-off onto Lampson.

17-498

7) Public Space for Recreation. Not enough recreation areas for residents will lead to them using parks and courts in adjacent neighborhoods that are paid for by other cities.

17-499

8) Aesthetics - Views from along Lampson. Impact of property values in dissimilar single-family neighborhoods next to the project.

I look forward to the results of your environmental/technical studies in this matter.

17-500

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender kdkalish2@yahoo.com

Hi, I live in College Park East, right across Lampson Avenue from where this proposed project will be. Our neighborhood has concerns regarding the extra traffic, particularly in the morning rush hour, this will create by the intersection of Lampson and Seal Beach Boulevard. That is the ONL Y Way we can get from our neighborhood to all the area schools. They will also be the only way for people living in this new development to get to those same schools. We only have two ways to get out of our development. We also have to deal with all the traffic cutting through Lampson Avenue when there's an accident on the 405. I also fear that when the 405 construction is done, there will be log jams where the freeway narrows going into Long Beach, causing even more cars to take shortcuts on Lampson Avenue. I hope your environmental impact study will take this into account. 17-501

I also have concerns about inadequate parking, which is going to cause people to come across the street and park in our neighborhood. I also have concerns that you are not building tennis courts. We only have two for entire development, and I'm sure people in this new development will come across the street and play on our tennis courts, financed by the city of Seal Beach. You really need to provide tennis courts for your own development, to prevent this from happening. It is the only fair thing to do, since it is already hard enough for us to get an empty court. I have to sit there with my daughter for over an hour sometimes waiting. We shouldn't have to wait longer because we paid for the upkeep of this court with our Seal Beach tax dollars, and people from another city will be using our facilities at our detriment, if you don't provide adequate recreational facilities for your residents. Yes, it would be less land to build more houses, which means less tax revenue, but please be fair to your neighbors in Seal Beach! 17-502

I want you to remember when the people of Rossmoor complained about the LA fitness that was proposed to go into the shops at Rossmoor, within the city of Seal Beach, many people in Seal Beach had their backs (I was one of them), and fought with them to help defeat that proposed construction. We didn't have to do that, because that location didn't really affect our day-to-day lives. Just like this development happens to be in a location that won't affect anyone else from Los Alamitos, so it's easy for you to just push the development where it impacts residents of other cities, not your own city. I'm not saying you shouldn't build anything in that area, but I think the project should be much less ambitious than what you are proposing, to not result in a huge detriment to your neighbors in Seal Beach. 17-503

Sincerely,
David Kalish

Hello, good day.

I would like to suggest building a sound wall on the Los Alamitos side of the Lampson Project to help muffle the noise which so many new residents will inevitably generate into the now peaceful neighborhood of Seal Beach College Park.

I would like to suggest not building quite as many new homes, thereby making room for a park in the new development.
It is important.

17-504

Lastly I would ask that the developers provide funding for anyone in the Seal Beach College Park area, whose backyard fence borders Lampson, so that those residents may heighten their backyard fences to the maximum height allowable at no cost to the residents themselves.
The developers should also provide funding for air purifiers for those Seal Beach residents, as the air quality will suffer greatly with the influx of so many additional vehicles.

17-505

Thank you,
C Reynolds

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender kellien@gmail.com

I am writing to express my concerns about the Lampson Housing Project. I live in the College Park East neighborhood and have lived here for 5 years and think the plans proposed for the West Ed location do not make sense for the area and should not be approved. I have concerns about parking, safety, traffic, noise, and services.

17-506

The proposed number of parking spots allocated to the community is highly insufficient. A little over 2 parking spaces per home is not sufficient for any neighborhood. Prior to moving to Seal Beach my husband and I lived in the 360 at South Bay planned community in Hawthorne, CA. It was new construction consisting of condos, townhouses, and single family homes. Each home had a garage and there were also street parking spots (both parallel parking along streets as well as pull-in spots on side streets). We parked our cars inside our garage and only needed street parking for our guests. Even with this, parking was a nightmare. We had many occasions where we had to have guests park outside the community and we had to go pick them up and shuttle them to our home. The amount of parking proposed at this location seems very similar and therefore very inadequate. Residents and guests are going to end up parking in the College Park East neighborhood and trying to cross a very dangerous street, Lampson. Even in our single family home community I find that our street is always full of cars because people don't use their garages and have more than 2 cars, filling our streets with overflow from another community will only make it worse. If this is to proceed then I think fewer homes should be planned and more space allocated to parking so that all of the residents and their guests can easily park in the community without needing our streets for overflow.

17-507

Earlier I mentioned Lampson being a dangerous street and this community would make it even worse. In my short 5 years here there have been an extreme amount of accidents on Lampson, including fatalities. People drive too fast and don't notice people pulling out of the CPE community and the West Garden Grove community and adding a new community is not going to change that. Additionally, the project indicates no traffic light will be added meaning people that need to head south on Lampson will need to make a right and then a u-turn on Heather. Forcing tons of cars into u-turn situations is extremely dangerous and opening the street up to more accidents than it already has, and it already has too much.

I also have concerns about traffic. The intersections of Seal Beach Blvd and Lampson and Valley View and Lampson are very congested today with the existing communities and the traffic they produce that adding many more people and homes is only going to make it worse. Additionally, if a portion of this community is truly allocated for low income housing (I have my doubts that any of these properties will actually be affordable for low income families but that is beside the point) then public transportation will need to be easily accessible. To my knowledge there are no bus stops along Lampson and if they were to be introduced (if they aren't, people are going to walk 1.5 miles to Seal Beach Blvd or 1.1. miles to Valley View to catch the bus one way?!?!) then that would make traffic even more of a problem along

17-508

Lampson.

17-508 (CONT.)

My additional concern is the noise that this new community will create. We have been dealing with the base jack hammering for the last 4 weeks starting at 6:15am with no information on an end date and no explanation as to why the jack hammering needs to start earlier than 7am. I have reached out to my city representative and have received no response. This location would be even closer to my home and therefore even louder. We have endured massive amounts of freeway construction noise, now this base construction, and now we're going to deal with this? The communication has been great regarding the freeway construction but we received no notification of the base project and no notification about this proposed project either. I find this highly unacceptable and don't feel like we need this on top of everything else that has and hasn't been communicated to us.

17-509

Finally, I feel as if we do not have the appropriate amount of services in the area to accommodate a new community. We have very few grocery stores in the area and some of them are very old. The stores in the strip malls at Valley View and Lampson which would be the closest for this community are closing down, are very run down, or have been left empty for years. People in the community have raised concerns to the city of Garden Grove and to the owners of the properties and nothing is being addressed. We also have very old infrastructure for electricity, internet, cable, etc. and are well overdue for upgrades for the existing communities. And now we're proposing adding new residents and communities with no plans to address any of these issues. It feels like we're maxed out based on the current population unless changes to services are made and I think the priority should be the existing residents instead of new ones.

There are other concerns in addition to these but I feel like this is a long and very concerning list as it is. I do not think this is the right solution and the whole plan needs to be revamped and really should not be approved at all.

17-510

Thank you,
Kellie DuRose

Subject: Lampson Project Parent Concerns
Date: Wednesday, November 2, 2022 12:46:59 PM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender clyonmft@aol.com

To Whom it May Concern:

My daughter participates in the AYSO Region 159 program that is held weekly at Arbor park and we want to echo their concerns about the proposed Lampson project as follows:

AYSO Region 159 environmental concerns regarding the proposed 246 Residential Unit Project for 4665 Lampson Ave a.k.a. West Ed Property

17-511

1. Arbor Park has approximately 100 parking spots, with 30 of those parking spaces located on the south side of the dog park. Region 159 has always strived to provide adequate parking for the dog park, which leaves roughly 70 parking spaces available on Saturdays. Therefore, Region 159 families and volunteers utilizing Arbor Park on Saturdays routinely park in the 4665 Lampson Avenue parking lot. That parking lot provides over 300 parking spaces that are essential to our use of Arbor Park and ensure soccer families are not parking in the nearby neighborhood of College Park East (CPE). The proposed project at 4665 Lampson Avenue states it will provide 557 parking spaces that will be entering and leaving the property from Lampson Avenue between traffic lights at Heather Street and Rose Street. The lack of signal control currently planned for traffic in and out of the development will adversely impact traffic safety on Lampson. It is already a dangerous street with a history of serious accidents. The number of planned parking spaces is insufficient for the number of planned residences. Garage spaces will be used as storage, or other purposes other than parking. Many of the homes will have more than two or three cars and drivers. These homes will have guests that will need parking as well. Region 159 is concerned Arbor Park or CPE residential streets will then become overflow for the planned development.

17-512

2. CPE has less park acreage than other neighborhoods in Seal Beach, Los Alamitos or Rossmoor. Arbor Park has helped fill that void by providing a large grass area to support organized and unorganized sports including soccer and baseball. The proposed new development details do not show any park space, such as a playground for residents. Region 159 requests the EIR include a listing of existing parks within a ½ mile of the planned development. In addition, we request the EIR include an evaluation if the planned development should include park space, such as a playground, basketball court, etc. for the residents of the planned development, to not further impact already limited nearby park facilities.

17-513

3. Arbor Park is currently home to many recreational activities, some of which begin in the early hours of the morning, plus a portion of Arbor Park is used for a very popular dog park. Region 159 requests that the EIR include an evaluation of noise at Arbor Park during busy weekends when the park is filled with soccer matches and the dog park is being utilized. To avoid future complaints from the new residents of the planned development about noise from soccer Saturdays and the dog park, noise impacts should be studied and if necessary, mitigation measures proposed. The noise study should be conducted to include all hours of the day on Saturdays when whistles, loud voices, cheering and other noises are made.

17-514

Thank you for your time and consideration in this important matter.

Sincerely,

Christina Zandi

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender mautado@gmail.com

Hi!

As a resident of CPE I support the development of the new neighborhood off of Lampson, but I'd like to bring attention to a few things:

Parks: Our parks in Seal Beach need a lot of TLC and it's very important that the new neighborhood has a great recreational area with a park.

Dog park: Talk to the city of Seal Beach and see if one of the parks in CPE could have a dog park area.

Parking: Make sure there's enough parking available for residents in new neighborhood.

Bike lane: the bike lane on lampson needs to be widened and segregated. There are just too many accidents on Lampson including cyclists.

Lampson x Seal Beach blvd.
No stop right turn to Seal Beach blvd North would be essential to keep morning traffic flowing when everyone is trying to get their kids to school in Los Alamitos and Rossmor.

17-515

From: Alan De La Vara
To: Tom Oliver
Subject: Lampson Project Proposal
Date: Wednesday, November 2, 2022 3:21:52 PM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender alandelavara@gmail.com

Good afternoon Mr. Oliver,
I am Alan De La Vara, homeowner at 4565 Ironwood Ave, Seal Beach, CA 90740.
My home's back wall faces Lampson Ave., almost directly across the street from where the proposed project is to be located.
I would like to inquire as to what steps the city and developer have taken to address many of the concerns of the community residence, environment, pets, nature and natural resources.

17-516

- Has a study been conducted regarding traffic loads on Lampson?
- Can the current drainage etc handle the increased homes?
- Is there a completed design of the project and consideration to privacy for those who may have back yards with children viewed from residents in the new construction?

17-517

- Has a study been conducted regarding; dust, pollution, noise to be created by the additional residence

17-518

- Will the walls along Lampson be raised to combat increased noise pollution? Who pays for this? The city? the developer?
- Are the roads on Lampson equipped to accommodate the increased vehicle traffic

17-519

- Will the developer conduct studies to the noise levels created by increased traffic on Lampson
- Have any animal rights groups been contacted to test noise levels / pollution levels and potential life threatening harm to the pets that live in homes along lampson who reside in backyards that now will have their

I believe this is a VERY bad idea for this particular area.
Lampson is already prone to accidents as it is used as a thoroughfare between two major streets and is an almost exclusive access point to thousands of residents.
Congestion, accidents and possibly deaths from people now entering and exiting to and from the development to Lampson are sure to follow.

17-520

Please don't let your name go in history as someone who was attached to this horrible idea.

Best,
Alan De La Vara

Dear City of Los Alamitos and Seal Beach,

As a resident of College Park East in Seal Beach, I strongly oppose the Lampson St. housing project. This high density housing project, as planned, will cause major traffic issues (safety, backed-up traffic, etc.), impede parking in our own neighborhood by the overflow of cars in the proposed neighborhood, make the soccer field and dog park less accessible, cause a burden on the school district and it doesn't just impact CPE, it impacts West Garden Grove as well.

Please stop this project or at least enforce a plan with less homes and more parking for the new community.

Thanks,

Tamee MacKay

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender vergarar@gmail.com

Good Afternoon,

I'm writing to voice my objection to the Lampson high density housing project. As a current resident in College Park East, I feel that this project will negatively impact not only our neighborhood, but Seal Beach and Los Alamitos as a whole.

Aesthetically, these mid-rise buildings will dilute the intimate neighborhood setting that we currently have. But that's almost the least of our potential issues.

17-522

Construction will produce pollution on various levels. Years of air pollution with the dust, on site field fabrication and construction will affect breathing conditions for everyone, including the elders and children of the neighborhood, The noise will be a hindrance to residents living in CPE. Traffic will be congested on Lampson. With those roads only being two lanes each way with no space to expand, there will be a noticeable difference in driving conditions.

17-523

I'm mostly concerned about what adding close to a thousand more residents will do. More traffic means less safety along Lampson and nearby major intersections. Higher population means overloading nearby grocery stores, restaurants, local businesses, and local resources like libraries. A potentially higher number of students would make a higher student to teacher ratio at our schools, which would impact our education system. Without its own dedicated park, we could be seeing higher traffic and use of the parks we have in CPE that already need improvements with the younger families moving in. We already have an increased younger family population moving into CPE which is great for the neighborhood and community, but we need to continue to keep it safe by limiting overall population in the surrounding area. We already have a healthy, steady growth and adding such high density housing will quickly create a situation that the infrastructure and resources cannot quickly keep up with.

17-524

I feel extremely blessed and grateful for our small community here in Seal Beach and Los Alamitos, and hold CPE close to my heart as a resident. It's the last small pocket of a city that resides close to the beach that is tucked away between Long Beach and Huntington Beach, and I strongly hope that you, your colleagues, and city recognize that we want to keep our community safe, maintained, and it's unique intimate personality where everyone knows everyone.

Thank you for your time in reading this.

A grateful resident of CPE,

Ryan Vergara

> Mr. Oliver-
>
> Please consider the negative impact the housing project at 4665 Lampson will have on Arbor Park, which is widely used by the community and specifically for AYSO purposes. AYSO has served the families of our community for over 40 years and taking away the fields will have an adverse effect on families and the community. For those players that don't have the skill set to play for a club team, or their family does not have the resources to spend on playing club soccer, AYSO is the only recreational option.

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender dberger@crescentsolutions.net

Hello Tom,

I am a resident of College Park East in Seal Beach and I would like to write you to oppose the project for 4665 Lampson Avenue for the following reasons:

- The new project would increase traffic on Lampson to an unsafe level
- Overflow parking from the new residents would overflow into CPE, reducing available street parking to CPE residents.

17-527

- Arbor Park will not have enough parking spots for the hundreds of families who attend AYSO soccer at Arbor Park. AYSO region 159 is an amazing organization who has been in the community for decades and have used Arbor Park for decades as well. The reduction of parking caused by the proposed unit project would jeopardize the success of playing soccer at Arbor Park and will negatively affect the children and families of our community.

I am hoping you will take into account the concerns of CPE residents and the detrimental effect this project would have on AYSO region 159 and the children.

17-528

Thank you,

Derek Berger

Tom
As a long time resident of Seal Beach and College Park East (CPE) I am very concerned, for a number of reasons, about the proposed development of the former West Ed property. My concerns include:

1. elimination of the parking historically made available by the property to support AYSO and other Arbor Park activities.
2. the proposed development has inadequate parking planned for the number of units so it is highly likely overflow will migrate into adjacent CPE
3. the proposed development does not include reasonably safe access to Lampson Ave (access is not via traffic signals) and will also substantially increase traffic both during construction as well as post construction
4. the proposed development does not include an adequate park (playground, basketball courts, etc.) for the size of the development and so families will be flocking to the CPE (Seal Beach) parks

I hope you will take these into consideration for any approvals for development of the property.

Sincerely

Jeff Grgas

Hello,

I am a soccer parent new to the AYSO region 159 serving kids and family for decades. I just wanted to share couple of my concerns with this new project. First, the impact on traffic when Arbor Park is in full operations during peak soccer seasons and the neighboring dog park. I don't think residents of the new units, as well as neighboring communities, would appreciate the potential delays and stresses that come with such situations. Not to mention the risk increase of accidents when traffic may be at such a high density.

The second is the impact of noise for neighboring communities as well as for the new residents. Noise not only from activities of the park during busy times on the weekends, but also from the Los Alamitos Joint Forces Training Base which is virtually right next door. The airfield traffic consists of certain civilian, law enforcement and military traffic, with occasional visits from tactical jets. When these tactical jets break overhead to enter the traffic pattern, their flightpath goes right over the proposed units. Believe me, the sudden blast of jet noise from these jets will be quite alarming and has the effect of disturbing the peace, waking children and babies from their naps to even causing adverse medical conditions for any elderly residents. From history, airport neighborhoods that complain about airplane noises were always built well AFTER the establishment of the airfield/airport and this situation is looking like yet another example of airport vs. neighboring communities.

Please consider these factors before preceeding,

Thank you,
Tony Sun
Garden Grove, CA

Subject: PROPOSED 246 RESIDENTIAL UNIT PROJECT FOR 4665 LAMPSON AVENUE A.K.A. WEST ED PROPERTY
Date: Wednesday, November 2, 2022 11:29:41 AM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender anthony.aboseif@gmail.com

Good morning Mr. Oliver,

I am a parent whose children participate in AYSO159 in both the fall and spring and I would also like to echo the concerns expressed by AYSO 159 (below) regarding the proposed project at 4665 Lampson Ave. I am also concerned about increased traffic and noise as well as overall pedestrian safety on Lampson that would result from the proposed project. 17-532

1. Arbor Park has approximately 100 parking spots, with 30 of those parking spaces located on the south side of the dog park. Region 159 has always strived to provide adequate parking for the dog park, which leaves roughly 70 parking spaces available on Saturdays. Therefore, Region 159 families and volunteers utilizing Arbor Park on Saturdays routinely park in the 4665 Lampson Avenue parking lot. That parking lot provides over 300 parking spaces that are essential to our use of Arbor Park and ensure soccer families are not parking in the nearby neighborhood of College Park East (CPE). The proposed project at 4665 Lampson Avenue states it will provide 557 parking spaces that will be entering and leaving the property from Lampson Avenue between traffic lights at Heather Street and Rose Street. The lack of signal control currently planned for traffic in and out of the development will adversely impact traffic safety on Lampson. It is already a dangerous street with a history of serious accidents. The number of planned parking spaces is insufficient for the number of planned residences. Garage spaces will be used as storage, or other purposes other than parking. Many of the homes will have more than two or three cars and drivers. These homes will have guests that will need parking as well. Region 159 is concerned Arbor Park or CPE residential streets will then become overflow for the planned development. 17-533

2. CPE has less park acreage than other neighborhoods in Seal Beach, Los Alamitos or Rossmoor. Arbor Park has helped fill that void by providing a large grass area to support organized and unorganized sports including soccer and baseball. The proposed new development details do not show any park space, such as a playground for residents. Region 159 requests the EIR include a listing of existing parks within a ½ mile of the planned development. In addition, we request the EIR include an evaluation if the planned development should include park space, such as a playground, basketball court, etc. for the residents of the planned development, to not further impact already limited nearby park facilities. 17-534

3. Arbor Park is currently home to many recreational activities, some of which begin in the early hours of the morning, plus a portion of Arbor Park is used for a very popular dog park. Region 159 requests that the EIR include an evaluation of noise at Arbor Park during busy weekends when the park is filled with soccer matches and the dog park is being utilized. To avoid future complaints from the new residents of the planned development about noise from soccer Saturdays and the dog park, noise impacts should be studied and if necessary, mitigation measures proposed. The noise study should be conducted to include all hours of the day on Saturdays when whistles, loud voices, cheering and other noises are made. 17-535

Thank you for your consideration.

Sincerely,
Anthony Aboseif

Subject: Proposed Housing Project on Lampson Ave.
Date: Monday, October 31, 2022 10:53:06 AM

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender ddelaterre@aol.com

Hi Tom.

Just want to touch base with you regarding the proposed project on Lampson Ave. I would like to know where the water is going to come from to service the residents of this proposed project? We are constantly told we must save water. Yesterday I saw a news article stating our federal government is warning Western States it may impose Colorado River cuts. My husband and I are very involved with the Aquarium of the Pacific. We have heard many scientists speak about this. It is not a hoax as some seem somehow to believe. In addition, there is a problem the adequacy of the electric grid. 17-536

In addition, there is the matter of the traffic on Lampson. Is the City of Los Alamitos Police Department even going to bother to patrol the area? How is all of the traffic going to be handled. It appears to me there is no concern for this. 17-537

This development as it stands is way too large for the area. If it does happen it needs to be drastically scaled down.

One more thing, I do not feel there is any such thing as affordable housing in this area. What are the proposed prices?

Also I do not feel that the parking alloted is anywhere near what would be needed. We do not want these people parking in our College Park East neighborhood. We do not have enough parking as it is when the holidays are here. Also we do not want the children of these people using our parks and playgrounds. The City of Los Alamitos will not pay for anything damaged or any thefts, etc. that occur as a result of people from the proposed project. 17-538

Thank you for your consideration.

4665 LAMPSON AVENUE VEHICLE MILES TRAVELED (VMT) ANALYSIS

Ms. Nicole Morse,

Urban Crossroads, Inc. has completed the following Vehicle Miles Traveled (VMT) Analysis for the 4665 Lampson Avenue (**Project**), which is located in the City of Los Alamitos.

PROJECT OVERVIEW

The Project consists of the development of 55 single-family detached residential dwelling units (cluster homes), 114 multi-family (low-rise) residential dwelling units, and 77 affordable apartment dwelling units (total of 246 dwelling units). A preliminary site plan for the proposed Project is shown in Exhibit 1.

EXHIBIT 1: PRELIMINARY SITE PLAN

BACKGROUND

Changes to California Environmental Quality Act (CEQA) Guidelines were adopted in December 2018, which require all lead agencies to adopt VMT as a replacement for automobile delay-based level of service (LOS) as the measure for identifying transportation impacts for land use projects. This statewide mandate went into effect July 1, 2020. To aid in this transition, the Governor's

Office of Planning and Research (OPR) released a Technical Advisory on Evaluating Transportation Impacts in CEQA (December 2018) (**Technical Advisory**) (1). On December 19, 2022, the City adopted VMT thresholds of significance for purposes of analyzing transportation impacts under CEQA, consistent with OPR's Technical Advisory.

VMT SCREENING

As part of the Technical Advisory, a project may be determined to have a less than significant impact and may be screened out of requiring a detailed VMT analysis if either the daily vehicle trips generated by the project criteria, or the land use type criteria are met.

The following screening criteria are described within the Technical Advisory:

- Small Project Screening
- Map Based Screening
- Transit Priority Area (TPA) Screening
- Affordable Residential Development Screening
- Local Community Serving Project Type Screening

A land use project need only meet one of the above screening criteria to result in a less than significant impact.

SMALL PROJECT SCREENING

The Technical Advisory indicates that projects generating fewer than 110 daily vehicle trips may be presumed to have a less than significant impact. Trips generated by the Project's proposed land uses have been estimated based on trip generation rates collected by the Institute of Transportation Engineers (ITE) Trip Generation Manual, 11th Edition, 2021 (2). The proposed Project is anticipated to generate 1,658 vehicle trip-ends per day, which exceeds the 110 vehicle trips per day threshold. (See Attachment A.)

Small Project screening criteria is not met.

MAP BASED SCREENING

As noted in the Technical Advisory, "residential and office projects that locate in areas with low VMT and that incorporate similar features (density, mix of uses, and transit accessibility) will tend to exhibit similarly low VMT." It is our understanding that the City of Los Alamitos has not established screening maps to depict areas of low VMT within the City. Alternatively, the Orange County Transportation Model (**OCTAM**) was utilized to obtain the Project's transportation analysis zone (TAZ) existing VMT information. The Project was located in the OCTAM model, and the Project was found to be located in TAZ 634. Project TAZ 634 was identified to have an existing VMT per capita of 22.71. The OCTAM model was then used to calculate the County of Orange regional average VMT per capita of 17.42. The Project is not located in a low VMT area.

Map Based screening criteria is not met.

TPA SCREENING

The Technical Advisory states that projects located within a TPA, ½ mile of an existing "major transit stop,"[1] or an existing stop along a "high-quality transit corridor"[2] will have a less than significant impact on VMT.

Once a project is determined to be within a TPA, the Technical Advisory also recommends consideration of secondary screening checks. For example, a proposed land use project is **not** eligible for TPA screening if the project meets any of the following sub-criteria:

1) Has a Floor Area Ratio (FAR) of less than 0.75;
2) Includes more parking for use by residents, customers, or employees of the project than required by the jurisdiction (if the jurisdiction requires the project to supply parking);
3) Is inconsistent with the applicable Sustainable Communities Strategy (as determined by the lead agency, with input from the Metropolitan Planning Organization); or
4) Replaces affordable residential units with a smaller number of moderate- or high-income residential units.

Utilizing Graphical Information System (GIS) data obtained from Southern California Council of Governments (SCAG), the Project's location relative to its proximity to TPA area was mapped. The mapped results identify the Project is not located within a TPA. (See Attachment B.)

TPA screening criteria is not met.

AFFORDABLE RESIDENTIAL DEVELOPMENT SCREENING

The Technical Advisory states "Adding affordable housing to infill locations generally improves jobs-housing match, in turn shortening commutes and reducing VMT." Furthermore, "low-wage workers in particular would be more likely to choose a residential location close to their workplace, if one is available." In areas where existing jobs-housing match is closer to optimal, low-income housing nevertheless generates less VMT than market-rate housing. Therefore, a project consisting of a high percentage of affordable housing may be a basis for the lead agency to find a less-than-significant impact on VMT. The Project is proposing 77 affordable housing units, or 31% of the total 246 dwelling units. As previously discussed, since the City of Los Alamitos has not formally adopted thresholds to determine the amount of affordable housing applicable to screening within the City, an affordable housing screening qualification cannot be made.

Affordable Residential Development screening criteria is not met.

[1] Pub. Resources Code, § 21064.3 ("'Major transit stop' means a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.").
[2] Pub. Resources Code, § 21155 ("For purposes of this section, a high-quality transit corridor means a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.").

LOCAL COMMUNITY SERVING RETAIL SCREENING

The Technical Advisory indicates local serving retail uses are presumed to have a less than significant impact absent substantial evidence to the contrary. By adding retail opportunities into the urban fabric and thereby improving retail destination proximity, local-serving retail development tends to shorten trips and reduce VMT. The Project does not intend to develop any local serving retail uses.

Local Community Serving Project Type screening criteria is not met.

The Project does not meet any of the Screening Criteria for land use projects which would allow a determination of a less than significant impact on VMT. Therefore, a project-specific VMT assessment is required.

VMT ANALYSIS

VMT MODELING

The Technical Advisory indicates the correct tool to perform a VMT analysis should be consistent with the tool that was used to generate the jurisdictional averages for which a project resides, for an apples-to-apples comparison. The OCTAM sub-regional model is the appropriate tool for conducting VMT analysis for land use projects in Orange County, as it considers interaction between different land uses based on socio-economic data, such as population, households, and employment. The calculation of VMT for land use projects is based on the total number of trips generated and the average trip length of each vehicle. Therefore, the vehicle trips and average daily trip length for project-related vehicle trips are model derived from the OCTAM model.

VMT METRIC AND SIGNIFICANCE THRESHOLD

The Technical Advisory includes the following threshold recommendations for assessment of residential projects:

> "Recommended threshold for residential projects: A proposed project exceeding a level of 15 percent below existing VMT per capita may indicate a significant transportation impact. Existing VMT per capita may be measured as regional VMT per capita or as city VMT per capita. Proposed development referencing a threshold based on city VMT per capita (rather than regional VMT per capita) should not cumulatively exceed the number of units specified in the [Sustainable Communities Strategy] SCS for that city, and should be consistent with the SCS.
>
> Residential development that would generate vehicle travel that is 15 or more percent below the existing residential VMT per capita, measured against the region or city, may indicate a less-than-significant transportation impact. In MPO areas, development measured against city VMT per capita (rather than regional VMT per capita) should not cumulatively exceed the population or number of units specified in the SCS for that city because greater-than-planned amounts of development in areas above the region-based threshold would undermine the VMT containment needed to achieve regional targets under SB 375."

Based on the State-recommended threshold for residential projects and the existing regional VMT, as discussed below, a VMT impact is considered significant if a residential project generates more than 15% below the existing regional residential VMT per capita.

The existing regional average VMT per capita was calculated using the OCTAM model for the regional area, in this case Orange County. Table 1 identifies a summary for Orange County's county-wide average VMT per capita.

TABLE 1: COUNTY-WIDE VMT PER SERVICE POPULATION

Orange County	County-wide Average
Population	3,177,628
Home-Based VMT	55,361,825
VMT per capita	17.42

For Orange County, the VMT significance threshold for VMT impacts will be **14.8 VMT per capita**, which is 15% below the 17.42 VMT per capita regional average**.**

A significant cumulative impact would occur if the Project increased the total regional VMT compared to the cumulative no project condition. Furthermore, for all land use and transportation projects a significant impact would occur if the project were inconsistent with the RTP/SCS.

PROJECT LAND USE CONVERSION

In order to evaluate VMT, standard land use information must first be converted into an OCTAM compatible dataset. The OCTAM model utilizes socio-economic data (**SED**) (e.g., population, households, employment, etc.) instead of land use information for the purposes of vehicle trip estimation. The Project's land use information, such as dwelling units, must first be converted to SED for input into the OCTAM model. Adjustments in SED have been made to the appropriate Project TAZ within the OCTAM model to reflect the Project's proposed land use information. The population conversion factors were obtained from the State of California Department of Finance E-5 Population and Housing Estimates for Cities, Counties, and the State, 2011-2021 with 2010 Census Benchmark (3). Table 2 summarizes the SED inputs used to reflect the proposed Project.

TABLE 2: POPULATION ESTIMATES

	Project
Households	246
Population	647

PROJECT-GENERATED VMT

PRODUCTION/ATTRACTION VMT METHOD

Consistent with the Technical Advisory, project-level VMT analysis should evaluate home-based (HB) VMT divided by a project's population. HB VMT is calculated from OCTAM's Production/Attraction (**PA**) trip matrices and then divided by a project's population to derive the VMT efficiency metric VMT per capita. The method for calculating VMT sums all weekday VMT

generated by trips with at least one trip end in the study area (Project's TAZ) by trip purpose. The PA method tracks trips with at least one trip end in the analysis area to/from their ultimate destination unless that destination is outside of the model boundary area. Productions are land use types that generate trips (residences) and attractions are land use types that attract trips (employment). Productions and attractions are converted from person trips to vehicle trips for the purposes of calculating VMT. Table 3 presents the project-generated HB VMT utilizing the OCTAM model.

TABLE 3: MODEL-BASED PROJECT- GENERATED VMT

	Baseline (2022)	Long Range (2045)
HB VMT	13,824	13,439

VMT REDUCTION STRATEGIES

The California Air Pollution Control Officers Association (**CAPCOA**) Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity (December 2021) (**Handbook**) (4) has been utilized to determine trip reduction measures that may be applicable to the Project. The Handbook describes methods to quantify reductions in greenhouse gas emissions and in the case of Transportation measures, the associated reductions to VMT. This evaluation will focus on a review of the Handbook's Transportation measures that are determined to be applicable to the Project.

SELECTING MEASURES

To determine which Transportation measures should be considered from the Handbook, land use type, scale and locational context are each identified as key factors for determining an individual measure's applicability to a project. The Handbook contains a factsheet for each measure that describes the measure, locational context, scale of application, implementation requirements, and other considerations that should be reviewed to determine a measure's applicability.

PROJECT TYPE

Project type is an important consideration when determining which measures are applicable for consideration. For example, measures associated with neighborhood design are not applicable to an office project, whereas trip reduction programs intended to reduce employee commute VMT would not be applicable to a residential project.

SCALE

The Handbook identifies that measures can be applied at different scales or geographic levels, however, "some measures may only be applicable at the project-level, whereas others may be more appropriate within a broader planning context such as for a general plan or climate action plan." The geographic levels considered in the Handbook include Project/Site and Plan/Community. Project/Site applies to measures that can reduce VMT at the scale of an

individual development project or employer. Plan/Community refers to measures that reduce VMT at the scale of a specific plan, general plan or climate action plan. Transportation measures can be quantified at either the Project/Site scale or the Plan/Community scale, but never both.[3]

LOCATIONAL CONTEXT

The Handbook describes locational context as "used to identify trip reduction measures within the transportation sector that are appropriate in certain types of neighborhoods differentiated by transportation characteristics and level of development (e.g., rural, suburban, and urban)." More specifically, rural, suburban, and urban are defined as follows:

Rural: An area characterized by little development. Compared to urban and suburban areas, rural areas have a lower density of residences, higher numbers of single-family residences, and higher numbers of vehicle-dependent land use patterns. Where applicable, the Handbook provides three land use distinctions within the rural locational context category—R_a, R_b, and R_c. R_a refers to rural areas within a master-planned community. These rural areas often include a broad offering of amenities and services, which may be accessed by walking or other alternative forms of transportation. R_b refers to rural areas adjacent to a commuter rail station with convenient rail service to a major employment center. As the name implies, these rural areas have greater access to commuter rail as an alternative mode of transportation. R_c refers to rural areas with transit service and that are near jobs/services.

Suburban: An area characterized by dispersed, low-density, single-use, automobile dependent land use patterns, usually outside of the central city. Also known as a suburb.

Urban: An area located within the central city with higher density land uses than in the suburbs. Often characterized by multi-family housing, tall office buildings and dense retail.

The City of Los Alamitos is often considered suburban due to its surroundings and borderline urban as the City contains a diverse mix of land uses and abundant amount of multi-family housing, dense retail, and employment-related uses. VMT reduction measures will herein evaluate the Project's locational context as urban. Attachment C provides a matrix of VMT mitigation measures available to an urban residential project.

PROJECT DESIGN FEATURES - VMT REDUCTIONS

As the reduction in trips and associated VMT could not be accurately accounted for by the calculations conducted using the OCTAM model, these adjustments are made through the following calculations as described in the 2021 Handbook.

T-1 Increase Residential Density

This measure accounts for the VMT reduction achieved by a project that is designed with a higher density of dwelling units compared to the average residential density in the U.S. Increased densities affect the distance people travel and provide greater options for the mode of travel they

[3] Handbook, Page 37

choose. Increasing residential density results in shorter and fewer trips by single-occupancy vehicles and thus a reduction in VMT.

As the land use information that represents the Project was input into the OCTAM model, any increased density over the National average that would reduce VMT is included in the VMT estimates in Table 3 and no additional VMT reduction credit is assumed.

T-4 Affordable Housing

Specifically, "Land Use – T-4. Integrate Affordable and Below Market Rate Housing" requires multi-family residential units to be permanently dedicated as affordable for lower income families. The California Department of Housing and Community Development (2021) defines lower-income as 80 percent of area median income or below, and affordable housing as costing 30 percent of gross household income or less.[4] Table 4 provides the calculation variables and formula used to calculate VMT reduction.

TABLE 4: T-4. AFFORDABLE HOUSING CALCULATION VARIABLES

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from Project/Site VMT for multifamily residential developments	0-28.6	%	calculated
User Inputs				
B	Percent of multifamily units permanently dedicated as affordable	0-100	%	user input
Constants, Assumptions, and Available Defaults				
C	Percent reduction in VMT for qualified units compared to market rate units	-28.6	%	ITE 2021

$$A = B \times C$$

$$-8.87\% = 31\% \times -28.6\%$$

The Project is proposing 77 affordable housing units, or 31% of the total 246 dwelling units. As shown, the Project would reduce its project-generated VMT by 8.87% or 1,226 VMT.

T-15 Limit Residential Parking Supply

Limiting residential parking supply will reduce the total parking supply available at a residential project or site. Limiting the amount of parking available creates scarcity and adds additional time and inconvenience to trips made by private autos, thus disincentivizing driving as a mode of travel. Reducing the convenience of driving results in a shift to other modes and decreased VMT. Table 5 provides the calculation variables and formula used to calculate VMT reduction.

[4] 2021 Handbook; Page 80

TABLE 5: T-15. LIMIT RESIDENTIAL PARKING SUPLY CALCULATION VARIABLES

ID	Variable	Value	Unit	Source
A	Percent reduction in GHG emissions from VMT	0-13.7	%	calculated
User Inputs				
B	Residential parking demand	589	Parking Spaces	user input
C	Project residential parking supply	577	Parking Spaces	user input
D	Percentage of project VMT generated by residents	100	%	user input
Constants, Assumptions, and Available Defaults				
E	Percent of household VMT that is commute based	37	%	Caltrans 2012
F	Percent reduction in commute mode share by driving among households in areas with scarce parking	37	%	Chatman 2013

$$A = \frac{B - C}{B} \times D \times E \times F$$

$$-0.28\% = \frac{589 - 587}{589} \times 37\% \times 37\% \times 100\%$$

As proposed, the Project's parking supply will be limited to 577 parking spaces, which is 12 parking spaces below the 589 parking spaces required by the lead agency. As shown, the Project would reduce its project- generated VMT by 0.28% or 39 VMT.

PROJECT-GENERATED VMT COMPARISON WITH CITY THRESHOLD

The Project is estimated to reduce VMT by 1,265 VMT (1,226+39 VMT) with the inclusion of VMT-reducing project design features, as previously discussed. Table 5 shows the results of the project-generated HB VMT with the inclusion of VMT-reducing project design features, subsequent HB VMT per capita, and comparison to the City's adopted thresholds.

TABLE 5: PROJECT GENERATED VMT RESULTS

	Baseline (2022)	Long Range (2045)
Population	647	647
HB VMT	12,559	12,174
VMT per capita	19.4	18.8
Threshold	14.8	14.8
Percent Above Threshold	+30.1%	+27.0%
Potentially Significant?	Yes	Yes

As shown in Table 5, the Project would generate VMT per capita exceeding the City's adopted VMT impact threshold by 30.1% in the baseline condition and 27.0% in the cumulative condition. The Project is considered to have a significant VMT impact.

CUMULATIVE EFFECT ON VMT

The Project is not proposing a general plan amendment nor a change of zone. As the Project is consistent with the underlaying land use assumptions of the General Plan and Zoning the cumulative no project would the same as the cumulative with project. Therefore, the cumulative impact would be less than significant.

SUMMARY

Based on the results of this analysis, the following findings are made:

- The Project was evaluated against screening criteria as outlined in the Technical Advisory. The Project was not found to meet any available screening criteria, and a VMT analysis was performed.
- The Project's VMT analysis found the Project to exceed the regional (Orange County) VMT per capita threshold by 30.1% for baseline (2022) conditions and 27.0% for buildout (2045) conditions. Therefore, the Project is found to have a **significant and unavoidable VMT impact**.
- The Project is consistent with the City's General Plan underlaying land use assumptions and the cumulative no project would be the same as the cumulative with project. The Projects cumulative effect is found to be **less than significant cumulative impact on VMT.**

If you have any questions, please contact me directly at aso@urbanxroads.com.

Respectfully submitted,

ATTACHMENT C
VMT REDUCTION MATRIX

Subsector	Measure	Scale of Application	Applicable Locational Context	Applicability to Project
Land Use	**T-1 Increase Residential Density** This measure accounts for the VMT reduction achieved by a project that is designed with a higher density of dwelling units (du) compared to the average residential density in the U.S.	Project/Site	Urban, Suburban	Applicable.
	T-2 Increase Job Density This measure accounts for the VMT reduction achieved by a project that is designed with a higher density of jobs compared to the average job density in the U.S.	Project/Site	Urban, Suburban	Not Applicable, Project is not employment related.
	T-3 Provide Transit-Oriented Development This measure would reduce project VMT in the study area relative to the same project sited in a non-transit-oriented development (TOD) location.	Project/Site	Urban, Suburban	Not Applicable due to the Project's location to available transit.
	T-4 Integrate Affordable and Below Market Rate Housing This measure requires below market rate (BMR) housing.	Project/Site	Urban, Suburban	Applicable.
	T-17 Improve Street Connectivity This measure accounts for the VMT reduction achieved by a project that is designed with a higher density of vehicle intersections compared to the average intersection density in the U.S.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
Parking or Road Pricing Management	**T-14 Provide Electric Vehicle Charging Infrastructure** Install onsite electric vehicle chargers in an amount beyond what is required by the 2019 California Green Building Standards (CALGreen) at buildings with designated parking areas (e.g., commercial, educational, retail, multifamily).	Project/Site	Urban, Suburban, Rural	Not Applicable, no reduction to VMT.
	T-15 Limit Residential Parking Supply This measure will reduce the total parking supply available at a residential project or site.	Project/Site	Urban, Suburban	Applicable.
	T-16 Unbundle Residential Parking Costs from Property Cost This measure will unbundle, or separate, a residential project's parking costs from property costs, requiring those who wish to purchase parking spaces to do so at an additional cost.	Project/Site	Urban, Suburban	Applicable, but not feasible as increases in housing costs would not be consistent with State housing affordability goals.
	T-24 Implement Market Price Public Parking (On-Street) This measure will price all on-street parking in a given community, with a focus on parking near central business districts, employment centers, and retail centers.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
Neighborhood Design	**T-18 Provide Pedestrian Network Improvement** This measure will increase the sidewalk coverage to improve pedestrian access. Providing sidewalks and an enhanced pedestrian network encourages people to walk instead of drive.	Plan/Community	Urban, Suburban, Rural	Not Applicable in at the Project level.
	T-19A Construct or Improve Bike Facility This measure will construct or improve a single bicycle lane facility (only Class I, II, or IV) that connects to a larger existing bikeway network.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
	T-19B Construct or Improve Bike Boulevard Construct or improve a single bicycle boulevard that connects to a larger existing bikeway network. Bicycle boulevards are a designation within Class III Bikeway that create safe, low-stress connections for people biking and walking on streets.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
	T-20 Expend Bikeway Network This measure will increase the length of a city or community bikeway network. A bicycle network is an interconnected system of bike lanes, bike paths, bike routes, and cycle tracks. Providing bicycle infrastructure with markings and signage on appropriately sized roads with vehicle traffic traveling at safe speeds helps to improve biking conditions (e.g., safety and convenience). In addition, expanded bikeway networks can increase access to and from transit hubs, thereby expanding the "catchment area" of the transit stop or station and increasing ridership.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
	T-21A Implement Conventional Carshare Program This measure will increase carshare access in the user's community by deploying conventional carshare vehicles. Carsharing offers people convenient access to a vehicle for personal or commuting purposes.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
	T-21B Implement Electric Carshare Program This measure will increase carshare access in the user's community by deploying electric carshare vehicles. Carsharing offers people convenient access to a vehicle for personal or commuting purposes.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
	T-22A Implement Pedal (Non-Electric) Bikeshare Program This measure will establish a bikeshare program. Bikeshare programs provide users with on-demand access to bikes for short-term rentals.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
	T-22B Implement Electric Bikeshare Program This measure will establish an electric bikeshare program. Electric bikeshare programs provide users with on-demand access to electric pedal assist bikes for short-term rentals.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
	T-22C Implement Scootershare Program This measure will establish a scootershare program. Scootershare programs provide users with on-demand access to electric scooters for short-term rentals.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
Transit	**T-25 Extend Transit Network Coverage** This measure will expand the local transit network by either adding or modifying existing transit service or extending the operation hours to enhance the service near the project site.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
	T-26 Increase Transit Service Frequency This measure will increase transit frequency on one or more transit lines serving the plan/community.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
	T-27 Implement Transit-Supportive Roadway Treatments This measure will implement transit-supportive treatments on the transit routes serving the plan/community. Transit-supportive treatments incorporate a mix of roadway infrastructure improvements and/or traffic signal modifications to improve transit travel times and reliability.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
	T-28 Provide Bus Rapid Transit This measure will convert an existing bus route to a bus rapid transit (BRT) system. BRT includes the following additional components, compared to traditional bus service: exclusive right-of-way (e.g., busways, queue jumping lanes) at congested intersections, increased limited-stop service (e.g., express service), intelligent transportation technology (e.g., transit signal priority, automatic vehicle location systems), advanced technology vehicles (e.g., articulated buses, low-floor buses), enhanced station design, efficient fare-payment smart cards or smartphone apps, branding of the system, and use of vehicle guidance systems	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
	T-29 Reduce Transit Fares This measure will reduce transit fares on the transit lines serving the plan/community.	Plan/Community	Urban, Suburban	Not Applicable in at the Project level.
Clean Vehicles and Fuels	**T-30 Use Cleaner-Fuel Vehicles**	Plan/Community	N/A	Not Applicable in at the Project level.

Irvine, California 92602

Subject: Technical Memorandum - Response to DTSC Comments
Proposed Residential Development Project
4665 Lampson Avenue
Los Alamitos, California 90720
EFI Global Project No.: 045.10352

Dear Ms. Morse,

As requested, EFI Global, Inc. (EFI) has prepared this Technical Memorandum to address the comments received from the Department of Toxic Substances Control (DTSC), in a letter dated June 5, 2024.

Site Location

The Site is located on the north side of Lampson Avenue, approximately 860 feet west of Lunar Drive, in the city of Los Alamitos. The Site parcel is approximately 12.36 acres in size. The Site is developed with a two-story commercial office structure, which is approximately 88,000 square feet in size, within the central portion of the parcel. This structure, constructed in 1971, is currently occupied by WestEd (a non-profit educational research, development, and services agency), the California Department of Fish and Wildlife, the National Comfort Institute, Inc. (a heating ventilation, and air conditioning training center), and James J. Mentas, Attorney at Law. The remaining portions of the property consist of an enclosed asphalt-paved parking area on the western portion, two driveways via Lampson Avenue to the south, concrete walkways, a large grass field areas to the north and east of the on-site structure and landscaped on all sides.

Comment and Response

1. ***DTSC Comment 1***

Based on the Limited Phase II Environmental Site Assessment (ESA), there was no evidence of a significant release of potential chemicals of concern to the subsurface in the area investigated, which included in the diesel above ground storage tank (AST), elevator equipment room, and parking lot. Although low levels of total petroleum hydrocarbons (TPHd), lead and select organochlorine pesticides (OCPs) were detected in Site soils, the concentrations were well below residential screening levels, and thus, are de minimis in nature and do not warrant further investigation or mitigation.

Also, the Phase II ESA states: "Although the detected concentrations of arsenic found at the Site exceed the residential screening level, no levels are less than the DTSC upper bound background concentration of 12

mg/kg. Therefore, the on-site detections of arsenic are de minimis in nature and do not warrant further investigation or mitigation. Based on the results of the assessment activities detailed herein, the potential chemicals of concern detected in soil in the areas assessed (e.g., diesel AST, elevator equipment room, parking lot release area, and Site wide historical agricultural use) are not indicative of a significant subsurface chemical release has occurred. The detected concentrations found during this investigation are considered to be de minimis in nature for the proposed residential redevelopment, and it is EFI Global's opinion that no further assessment is warranted at this time with respect to the RECs (recognized environmental conditions) identified."

Since potential chemicals of concerns were found in the Phase II ESA and the detected concentrations of arsenic found at the site exceed the residential screening level and remain in excess of DTSCs upper bound background concentration of 12 mg/kg, DTSC recommends that all constituent concentrations meet screening levels in accordance with DTSCs Preliminary Endangerment Assessment (PEA) Guidance Manual. If the constituent concentrations do not meet screening levels in accordance with DTSC guidance, the following comments are also recommended:

Comment 1 - EFI Response

This comment appears to be based on a typographical error in the quoted language above in EFI's Limited Phase II Environmental Site Assessment (Phase II).

The following change will be made to the Phase II to more accurately reflect the fact that the detected arsenic concentrations found at the Site are all below the upper bound concentration of 12 mg/kg, and thus, are trace or background concentrations that do not warrant further investigation or mitigation.

"Although the detected concentrations of arsenic found at the Site exceed the residential screening level, all ~~no~~ levels are less than the DTSC upper bound background concentration of 12 mg/kg."

2. DTSC Comment 2

The City of Los Alamitos enter into DTSC's Standard Voluntary Agreement (SVA) program or seek oversight with your Certified Local Agency - Orange County Health Care Agency - so a proper evaluation of the Project is completed. If entering into an SVA with DTSC, the FLUXX portal link is provided and the page also has a link to the Fluxx User Guide that can help you navigate the system. You will need to create a new profile and once in the system, click "Start a Request for Lead Agency Oversight Application." DTSC recommends that once the SVA is signed, a Preliminary Endangerment Assessment Report (PEA Report) be submitted for DTSC review. The PEA Report shall summarize all existing data and provide an evaluation of the possible risk to current and future users of the site. If you have any questions about the application portal, please contact the DTSC Brownfield Coordinator Gregory Shaffer or contact the Application Portal Inbox.

Comment 2 - EFI Response

This comment was made in connection with DTSC's statement at the bottom of the Comment 1 that "if the constituent concentrations do not meet screening levels in accordance with DTSC guidance, the following comments are also recommended."

As made clear by the change provided above, all constituent concentrations do in fact meet or are lower than the screening levels. As such, the recommendation provided by DTSC in Comment 2 is not required for this Project.

3. DTSC Comment 3

If buildings or other structures are to be demolished on any project sites included in the proposed project, surveys should be conducted for the presence of lead-based paints or products, mercury, asbestos

containing materials, and polychlorinated biphenyl caulk. Removal, demolition, and disposal of any of the above-mentioned chemicals should be conducted in compliance with California environmental regulations and policies. In addition, sampling near current and/or former buildings should be conducted in accordance with DTSC's Preliminary Endangerment Assessment (PEA) Guidance Manual.

Comment 3 - EFI Response

EFI concurs with the DTSC comment and recommends that a Pre-Demolition asbestos containing material (ACM), lead-based paint (LBP), and universal waste survey be performed as part of proposed future redevelopment activities.

4. DTSC Comment 4

All imported soil and fill material should be tested to ensure any contaminants of concern are within DTSC's and U.S. Environmental Protection Agency (USEPA) Regional Screen Levels (RSLs) for the intended land use. To minimize the possibility of introducing contaminated soil and fill material there should be documentation of the origins of the soil or fill material and, if applicable, sampling be conducted to ensure that the imported soil and fill material meets screening levels outlined in the PEA for the intended land use. The soil sampling should include analysis based on the source of the fill and knowledge of the prior land use. Additional information can be found by visiting DTSC's Human and Ecological Risk Office (HERO) webpage.

Comment 4 – EFI Response

EFI concurs with the DTSC comment regarding an evaluation of fill material prior to importing onto the Site.

We hope that this Technical Memorandum provides the information requested. If you have any questions or comments, please don't hesitate to contact the undersigned at (760) 473-5695.

Thank you,

EFI Global, Inc.

Brian Martasin, PG
Principal Geologist

following are EFI Global's conclusions and recommendations based on the results of the assessment activities detailed herein:

- Based on the investigation activities performed, evidence of a significant release of potential chemicals of concern to the subsurface in the area areas investigated, which included the diesel AST, elevator equipment room, and parking lot was not identified. Although low levels of TPHd, lead and select OCPs were detected in Site soils, the concentrations were well below residential screening levels, and thus, are *de minimis* in nature and do not warrant further investigation or mitigation.
- Although the detected concentrations of arsenic found at the Site exceed the residential screening level, ~~no~~ the levels are less than the DTSC upper bound background concentration of 12 mg/kg. Therefore, the on-site detections of arsenic are *de minimis* in nature and do not warrant further investigation or mitigation.

Based on the results of the assessment activities detailed herein, the potential chemicals of concern detected in soil in the areas assessed (e.g., diesel AST, elevator equipment room, parking lot release area, and Site wide historical agricultural use) are not indicative of a significant subsurface chemical release has occurred. The detected concentrations found during this investigation are considered to be *de minimis* in nature for the proposed residential redevelopment, and it is EFI Global's opinion that no further assessment is warranted at this time with respect to the RECs identified.

Subject: Technical Memorandum – Revised Response to Churchill Law Office Comments
Proposed Residential Development Project
4665 Lampson Avenue
Los Alamitos, California 90720
EFI Global Project No.: 045.10352

Dear Ms. Morse,

As requested, EFI Global, Inc. (EFI) has prepared this Technical Memorandum to address the comments received from Churchill Law Office, in a letter dated June 9, 2024. The comment letter pertains to EFI's Phase I Environmental Site Assessment (ESA), dated January 18, 2023, and Phase II ESA, dated August 16, 2022.

Site Location

The Site is located on the north side of Lampson Avenue, approximately 860 feet west of Lunar Drive, in the city of Los Alamitos. The Site parcel is approximately 12.36 acres in size. The Site is developed with a two-story commercial office structure, which is approximately 88,000 square feet in size, within the central portion of the parcel. This structure, constructed in 1971, was occupied by WestEd (a non-profit educational research, development, and services agency), the California Department of Fish and Wildlife, the National Comfort Institute, Inc. (a heating ventilation, and air conditioning training center), and James J. Mentas, Attorney at Law. The structure is currently vacant. The remaining portions of the property consist of an enclosed asphalt-paved parking area on the western portion, two driveways via Lampson Avenue to the south, concrete walkways, a large grass field areas to the north and east of the on-site structure and landscaped on all sides.

Comment and Response

Some of the comments received from Churchill Law Office merely restate or directly quote portions of the ESA. For example, one comments states: "The report states that EFI GLOBAL conducted only 'visual' observations of the site and structures." We do not provide a response below to any of these comments that restate or quote the ESA, and instead provide responses to comments that raise a concern regarding the ESA. All of the emphasized text below, such as the bold and all cap typeface, is from the original comment letter.

1. ***Churchill Law Office Comment 1***

The Consultant's Report is deficient because the property owner/user failed to comply with Section 1.4 entitled User Responsibilities" and deliver to Consultant ***the following public record*** *provided User in connection with the auction conducted by the GSA for the sale of the property User: FINAL Phase I Environmental Site Assessment Report, GSA Southwest Regional Laboratory, 4665 Lampson Avenue, Los Alamitos, California 90720, Contract No. GS-00F-168CA/Award No. GS-10F-0076K, Prepared For: United States General Services Administration Office of Real Property Utilization and Disposal (9PZ) 50 United National Plaza – 4th Floor North San Francisco, California 94102, Prepared By: Tetra Tech, Inc. 45610 Woodland Road, Suite 400, Sterling, VA 20166, May 2016, Tetra Tech Project No: 103G3995003.001.*

Comment 1 - EFI Response

The property owner/user complied with Section 1.4 and provided to EFI a digital copy of the above-referenced report. Upon review of the document, EFI notes that no recognized environmental conditions (RECs) or recommendations for additional investigation was noted. The findings of the above-referenced report do not alter the results of EFI's Phase I ESA, dated January 18, 2023.

2. Churchill Law Office Comment 2

EFI Global recommended a Phase II Environmental Site Assessment. The scope of the work included a geophysical survey and soil sampling of 11 borings on August 16, 2022. The Phase II Environmental Assessment soil samples revealed measurable levels of ***arsenic was detected in all 4 samples and the screening Level was exceeded; as well as lead.*** *The consultant pointed out that screening levels at Air Force Bases are significantly higher than for RESIDENTIAL USE.* ***The concentration found in the soil was 4.65 mg/kg, which is 42 TIMES the level allowed for residential use, identified by Consultant at 0.11 mg/kg.***

Given the intended use of the property for "residential" use *and outdoor recreation by residents in the soil, and the high water table underlying the property, liquefaction reported in the Hydrology and Geotechnical Reports, and the location of a ground water well belonging to the City of Seal Beach Department of Water, there is a risk to public safety and the need to assure* ***ground water supplies and storm drains are not contaminated by run off, and air borne contaminates are not released during construction.***

Comment 2 - EFI Response

For clarification, the arsenic screening levels were not compared to an Air Force Base land use scenario. It is well documented and accepted by regulatory agencies, including the Department of Toxic Substances Control (DTSC) that background or trace concentrations of naturally occurring arsenic in soil throughout the state of California often exceeds the DTSC screening level (SL) value of 0.11 milligrams per kilogram (mg/kg). With respect to Air Force Bases, a statistical analysis was performed at 14 Air Force installations in California to evaluate background levels of naturally occurring arsenic. As described in the Phase II, as a result of this analysis, an upper bound background concentration of 12.7 mg/kg can be used as an initial screening level for arsenic concentrations.

Furthermore, in a study titled *Determination of a Southern California Regional Background Arsenic Concentration in Soil* (Chernoff, et al., 2008), which was prepared by DTSC staff, the authors concluded, "A Probability Plot and statistical analysis of a large data set from school sites in Los Angeles County gave an upper-bound arsenic concentration of 12 mg/kg. A Probability Plot for school sites from 5 counties in Southern California also gave an upper-bound background arsenic concentration of 12 mg/kg." The study concluded, "This finding suggests that 12 mg/kg [may be] a useful screening number for evaluating arsenic as a chemical of potential concern."

Based on the aforementioned studies, which included both Air Force Base installations and school sites in California, it has been determined that 12 mg/kg is a useful screening number for evaluating arsenic as a chemical of potential concern. All arsenic concentrations in the soil samples analyzed at the Site were detected at concentrations less that the upper-bound arsenic concentration of 12 mg/kg, and therefore, arsenic is not considered a significant environmental concern that would warrant further investigation or mitigation, or result in an unacceptable health risk due to release during construction or to future occupants.

3. Churchill Law Office Comment 3

*Additional chemical analysis of the soil for **other hazardous materials** that may become **wind borne during construction should be conducted, mitigation measures identified**, and the results shared with the City of Seal Beach and City of Los Alamitos and any other governmental agency entitled to those results, before the EIR is approved.*

Comment 3 – EFI Response

Based on the results of EFI's Phase I ESA and subsequent Phase II ESA, no additional hazardous substances or hazardous materials were identified that would require further investigation and/or mitigation or reporting to local and state regulatory agencies. EFI notes that construction Best Management Practices (BMPs) will be employed as part of the proposed future redevelopment to minimize fugitive dust and/or runoff as a result of site improvements.

4. Churchill Law Office Comment 4

*The 12 acre site will be graded to provide building pads to address flooding on the site, will create dust and wind borne contaminates such as lead, arsenic and asbestos, necessitates **rigid ongoing monitoring** and reporting to the City of Seal Beach and City of Los Alamitos.*

*Consultant identified **asbestos** within the building to be removed that requires special precautions to prevent contamination of the site. Mitigation measure includes asbestos Operation and Maintenance Plan in addition to asbestos abatement PRIOR TO any renovation/ demolition that would disturb the building materials.*

Lead based paint,** possible **radon concentrations. Mitigation measures include construction personnel be properly trained in lead related construction.

*Additional Testing is required for TPHd -diesel in soil sample, **evidence of flooding and storm drain run off** that could carry untreated contaminants into the ocean, all must to be addressed by the Consultant in terms of mitigations measures before and during construction to protect the water supply, prevent air pollution, and protect the public's safety.*

Comment 4 - EFI Response

EFI notes that lead and arsenic were not detected at concentrations that would pose an unacceptable health risk to future Site occupants, the surrounding community or underlying groundwater. Furthermore, and as noted above, construction BMPs will be employed as a part of the proposed future redevelopment project to mitigate fugitive dust. Therefore, ongoing monitoring and reporting would not be warranted.

Prior to any future demolition or Site improvements, the Site structures will undergo routine abatement for asbestos and lead based paint, which will be performed by a properly licensed contractor. Furthermore,

such activities will be performed in compliance with South Coast Air Quality Management District (SCAQMD) requirements for the removal and disposal of any suspect asbestos containing material or lead-based paint.

As noted in EFI's Phase I ESA, dated January 18, 2023, based on research by the USEPA, the average radon concentrations for Orange County are less than 2.0 picocuries per liter (pCi/L), which is below the 4.0 pCi/L action level set by the USEPA. Furthermore, the *Radon Potential Zone Map for Orange County, California, dated 2015* notes that the subject property and surrounding area are located in an area of "Low Potential for Indoor Radon Levels Above Four PicoCuries per Liter" (https://www.conservation.ca.gov/cgs/Documents/Publications/Special-Reports/SR_232-Radon-Map.pdf). Therefore, radon is not an environmental concern for the proposed future development, and further investigation or mitigation is not warranted.

The project will result in the demolition of the currently existing vacant office building in order to allow for project construction, and thus radon testing associated with the existing office building would not result in any relevant results as to the project. Even after demolition of the building, as a general rule it is not industry standard to test a vacant lot for radon and receive accurate results representative of what future construction conditions may be and given that the project site is located within a low potential area for radon, no testing of radon after construction would be required.

Based on the results of our Phase II ESA, the concentrations of TPH-d detected in site soils does not warrant further investigation. Furthermore, the concentrations do not pose an unacceptable health risk to site occupants, the environment, water supply, or groundwater.

We hope that this Technical Memorandum provides the information requested. If you have any questions or comments, please don't hesitate to contact the undersigned at (760) 473-5695.

Thank you,

EFI Global, Inc.

Specialties include master plans, land use compatibility plans, lease negotiations, business strategy, facilities planning, ownership transfer, environmental entitlements, regulatory certification, aviation safety analysis, security planning, real estate strategy and construction planning. Nick founded Johnson Aviation in 2004 providing leadership on high profile and contentious airport master planning and environmental projects.

Nick is currently developing a Vertiport Feasibility Study at John Wayne Airport, Orange County California for fixed-base operator ACI Jet Orange County as part of its comprehensive facilities renovation project. The FAA, through its planning, design and advisory process has acknowledged that Advanced Air Mobility (AAM) is an emerging aviation ecosystem that leverages new aircraft and array of innovative technologies to provide the opportunity for more efficient, sustainable, and equitable transportation options, including serving airport passenger access. The purpose of the study is to draw together the uncertain and developing AAM possibilities with safe, efficient, and compatible needs of constrained airport infrastructure. Building stakeholder consensus on vertiport facilities is an added objective of the study.

Nick has also worked closely with the San Diego County Regional Airport Authority (SDCRAA) on its Airport Development Program (ADP) to complete the long-term redevelopment of San Diego International Airport. He worked as part of the Authority's team to entitle a replacement to Terminal 1, develop airfield improvements to optimize the efficiency of the busiest single-runway airport in the U.S. and optimize landside access. The project is currently under construction. He has also supported the Authority's CFR Part 150 study update to reduce community noise impacts and improve nearby land use compatibility.

From 2011 to 2018, Nick worked closely with the City of Ontario and the Ontario International Airport Authority (OIAA) to transfer ownership and operation of Ontario International Airport (ONT). He worked with a small team to develop the strategic business plan adopted in 2013 that defines and guides the Authority's mission. In 2015 and 2016, Nick led a large and diverse ownership transfer team to meet all regulatory, operational, financial, environmental, and legal requirements of the FAA. That team successfully transferred the ownership and operation of the Airport in 15 months. Johnson Aviation staff continued as the Airport's planning and development program managers for 20 months during the staffing transition negotiating long-term leases for the airport's FBO redevelopment and for a FedEx Regional Sorting Hub relocation and expansion that is now fully operational.

Since 2017 Nick has assisted Google with the Master Planning and development of their Proposed San Jose Campus in the City of San Jose, California and within the Mineta San Jose International Airport (SJC), Airport Influence Area (AIA) in Santa Clara County California. The Google Campus has the potential to transform Downtown San Jose with many new and expanded live/work development options. By focusing on the expansion of the existing Diridon Station, the Google Campus will complete station infrastructure for the California High Speed Rail, Bay Area Rapid Transit (BART) and Valley Transit Authority (VTA) systems. The project will both improve and potentially modify SJC air service depending on the various building heights and locations on the site. The total campus development is likely to exceed 10 million square feet of office, residential and retail uses that will be developed over the coming years.

Property redevelopment and land use compatibility on and near airports taking full advantage of the airport economic engine is one of Nick's unique contributions to airport communities. In addition to a land use compatibility plan for the joint use Colorado Springs Airport and Peterson Space Force Base, he has also served the City of Perris, California and various developers near March Air Reserve Base in Riverside County to both preserve and expand the vitality of the Base and its civilian cargo operations. He has worked with Boeing and their development successors to redevelop manufacturing facilities at Long Beach Airport, El Segundo, Seal Beach and Mesa Arizona. Other current airport land use compatibility planning includes the City of Goleta, City of San Luis Obispo, San Diego International Airport, Marine Corps Air Station Miramar, Naval Air Station North Island, City of Pleasanton and Fairfax County Virginia.

Nick assisted the FAA on updates and revisions to its key airport planning guidance documents. The FAA's Master Plan Advisory Circular (AC) was revised and updated to address innovations and lessons learned in the field of airport planning. The FAA's Airport Land Use Compatibility AC was completely rewritten to address the challenges of effective land use planning near airports to ensure the safe and compatible use of nearby land while maximizing the economic development characteristics of these surrounding areas. The FAA's Solar Guidance document was updated to consider the most recent findings of solar panel glare analyses and the effects on safe air navigation.

Nick worked closely with Los Angeles World Airports (LAWA) to secure City Council approval of the LAX Master Plan entitlements that were ultimately approved in December 2004. He provided technical planning support to the legal defense team on the LAX Master Plan when it was sued in State and federal courts. Four legal challenges related to the California Environmental Quality Act (CEQA) Environmental Impact Report (EIR) and to the National Environmental Policy Act (NEPA) ROD were successfully settled in December 2005. Nick also facilitated a required review and approval of key settlement provisions by the Federal Aviation Administration.

Nick worked with LAWA and its consulting team in the early phase of a multi-year study of key components of the LAX Master Plan. Together, they crafted an approach in close coordination with airline and community stakeholders. This planning initiative by LAWA was intended to modernize LAX and expand regional airport capacity throughout Southern California.

Nick provided strategic guidance to a team of airport planners from HNTB Corporation on the San Diego International Airport Master Plan. This plan was developed to meet the immediate needs of the airport and airline community while the policy for the long-term future of the airport was resolved. The Green Build terminal project was the first major plan component completed in 2013.

Prior to starting Johnson Aviation, Nick was a Vice President with Landrum & Brown in the firm's airport planning practice. He served as Landrum & Brown's Project Manager for the Los Angeles International Airport (LAX) Master Plan. He led the way in developing a plan for LAX that balanced the needs of the regional economy while finding practical solutions for the local impact to nearby communities as part of a multi-discipline consultant team. Nick also led various land re-use and property development projects for Landrum & Brown at other major California airports.

1.0 SITE DESCRIPTION:

The proposed development encompasses one parcel consisting of approximately 12.37 acres (APN: 130-012-35). The project is bounded by Lampson Avenue to the south, a golf course to the east, the Los Alamitos Joint Forces Training Base (JFTB) to the west, and Arbor Park to the north. There are two (2) existing driveways that provide access to the site from Lampson Avenue. Majority of the site consists of an existing paved parking lot and 2-story office building with walkways and various landscaping. The remaining portion of the site consists a large, vacant brush filled open space area. Per the City of Los Alamitos General Plan, the site is located within the Limited Multiple Family Residential designation. According to the city of Los Alamitos Zoning Map the site is located within the Multi-Family Residential (R-3) zone.

2.0 PURPOSE OF STUDY:

The purpose of this report is to provide quantitative information to verify the design of the storm drain infrastructure and hydrologic methodology of the project site. This report demonstrates that the subject site is designed and planned in accordance with the Orange County Hydrology Manual, the City of Los Alamitos and City of Seal Beach drainage requirements.

3.0 EXISTING CONDITIONS:

Per the existing topography, the site elevations range from approximately 21 to 26’ above mean sea level. The existing site generally flows in an east to westerly direction, however directs stormwater in the southerly direction to an existing westerly flowing concrete-lined channel along the site’s southerly property line. The existing concrete channel outlets to an 18” corrugated metal pipe (CMP) storm drain with headwall that flows under the existing offsite private roadway and discharges into an offsite earthen channel within the Los Alamitos Joint Forces Training Base (JFTB) property. Stormwater runoff flows within this earthen channel converge with runoff flows from portions of Arbor Park and JFTB and are then collected by an existing 24” CMP that continues to flow westerly, ultimately draining to the Old Ranch Country Club, located southwest from the site. Stormwater runoff is then ultimately conveyed downstream into the San Gabriel River/ San Pedro-Los Alamitos Bay.

Per field observations conducted by C&V Consulting, Inc., the existing concrete channel along the site’s southerly property line currently ponds up and overflows onto Lampson Avenue near the southwest corner of the site. Overflowing occurs on to Lampson Avenue due to the existing topography of the area. The westerly adjacent private roadway for Arbor Park access drains in the southerly direction directly onto Lampson Avenue. Refer to the Existing Conditions Hydrology Map in Appendix A.1 for additional information. Per conversations with City of Seal Beach staff, historical stormwater flows in Lampson Avenue exceed the top of curb elevation during large storm events. Based on the existing topography of the site, in the event the outlet pipe were to become clogged, the existing overflows from the property would flow onto Lampson Avenue at the low point at the southwest corner of the site.

Refer to the following photographic images of existing ponding during a March 2023 rain event:

Existing JFTB Earthen Channel (looking North)

Existing Onsite Channel/ Existing 18” CMP Outlet
(near southwest corner of site, looking East)

Existing Onsite Channel (looking West)

Per Orange County Flood Protection Goals: Figure 3-1 enclosed in Appendix A:

1. Flooding is allowed over the curb and to the right of way for the 100-year flood level as long as a minimum 1' freeboard from the building pad to the water surface elevation is provided and
2. Flooding is allowed to the top of the curb for 25-year flood level street flows as long as a 12' wide travel lane is provided for emergency vehicles. As shown in the existing street flow calculations enclosed in Appendix C.3, the 25-year water surface level street flows in Lampson Avenue along the project frontage are contained below the top of curb with a 12' wide travel lane provided for emergency vehicles in accordance with Orange County Flood Protection requirements.

In addition, the low point of Lampson Avenue occurs approximately 2,100 feet west of the site near the Old Ranch Country Club. Ponding is anticipated at this location based on the street design and ultimately low point. However, per the existing street flow calculations enclosed within Appendix C.3, the 100-year water surface elevation at this location is approximately 6" which is being held within the curb. Based on the existing topography of Lampson Avenue, flooding is not anticipated along the frontage of the site due to the flow-by nature of the existing

Refer to the Existing Conditions Hydrology Map located within Appendix A.1 of this report for additional information.

4.0 PROPOSED CONDITIONS:

The proposed development will consist of 169 for sale single family residential units (55 detached condos and 114 attached townhome units) and 77 for rent units (3 apartment buildings); for a total of 246 dwelling units. Proposed associated drive aisles, parking and flatwork will increase the overall impervious area compared to the existing condition of the site.

The proposed site's stormwater runoff will be conveyed by roof downspouts or street surface flow to proposed gutters and collected by thru-curb inlet biofiltration devices or catch basin inlets for water quality treatment. The biofiltration devices include an internal overflow bypass that direct flows via an onsite underground storm drain system to an underground detention system located under parking areas at the southwest portion of the site. From the detention system, a stormwater sump pump located in the southwest corner of the site will outlet flows into the existing 18" storm drain pipe at the southwest corner of the site, which conveys stormwater runoff to the JFTB property located directly west of the site. The detention system and pump will be sized so that the outlet flows from the developed site will be equal to, or less than, existing conditions for all storm events. In the event the stormwater pump fails or the outlet pipe becomes clogged, the emergency overflow for the site will be conveyed through a parkway drain discharging flow onto Lampson Avenue, matching historical drainage patterns.

Proposed pad elevations for the onsite buildings shall be set a minimum 1' above the 100-year water surface elevation in accordance with Orange County Flood Protection requirements.

A proposed 10' wide dedication area along the northern the property line is proposed to support the adjacent park. The 10' wide dedication area is outside the proposed residential development and does not flow to the site's proposed storm drain system. Existing conditions show that this area of site currently drains in the northerly direction.

Alternative Drainage System Outlets to Lampson Avenue:

There currently is no existing cross lot drainage arrangement between the JFTB and the subject property allowing for the proposed development's flows to outlet onto the JFTB. The JFTB controls all improvements on their property. If, for whatever reason, proposed flows from the project are not allowed to outlet to the JFTB, then the emergency overflow parkway drain will be utilized as the

primary discharge location. Placement of the proposed parkway drain is near the existing overflow location as described within the Section 3.0 Existing Conditions of this study, therefore closely matches the existing conditions.

A proposed stormwater pump system with upstream detention storage has been incorporated into the onsite drainage design to provide onsite peak flow and volume minimization for the development for all storm events. The pump system will control the outflow discharge rate matching the existing 2-year peak flow at approximately 8.9 cfs. The pump system along with upstream detention will ensure stormwater inundation within Lampson Avenue is minimized and no additional impact is anticipated whether the discharge location is to the existing JFTB 18" CMP storm drain pipe or the proposed park drain on Lampson Avenue.

Approaches to Drainage System Outlets Deemed Infeasible:

As part of this preliminary hydrology study, the following drainage designs with different outlet locations each of which were found to be infeasible upon closer review:

1. **Construct storm drain pipe in Lampson Avenue to west:**
   The proposed installation of approximately 2,400 linear feet (LF) of 30" underground gravity-fed storm drain pipe in Lampson Avenue to directly connect to closest downstream existing 36" storm drain pipe (north of Guava Avenue extended) was found to be infeasible due to conflicts with existing utilities; including existing 16" water, 8" sewer, and 34" gas mains. Installing 2,400 LF of force main, as opposed to gravity main, may also create long-term maintenance concerns. In addition, the installation of 2,400 LF of force main is not desirable due to head losses created by such a long length of pipe.

   Refer to the exhibits in Appendix D.3.

2. **Construct storm drain pipe under Heather Street, Hazelnut Avenue, and Guava Avenue to south and west:**
   Since there is no existing underground storm drain to connect within Heather Street or Hazelnut Avenue, a new storm drain pipe would need to be extended 3,000 LF through these streets to connect to the existing 36" storm drain pipe in Guava Avenue. The existing storm drain system is undersized according to the City of Seal Beach Master Plan of Drainage Update dated August 2008. Future City of Seal Beach capital improvements to the downstream storm drain system are recommended in the Master Plan of Drainage Update at this location (CPE 1A and CPE 1B as shown on Figure 1-3 in Appendix D.2), but there is no current timeline to install any capital improvements. Without the capital improvements in place, redirecting stormwater runoff flows from the site to the currently undersized storm drain system in Guava Avenue is infeasible since it would exacerbate the existing flooding condition at this location adjacent to single family homes.

   Refer to the exhibits in Appendix D.2 and D.3.

3. **Outlet Runoff to Arbor Park to North:**
   Arbor Park is within the JFTB property and drains south to the same earthen channel outlet as the project site. If the proposed flows from the project are not allowed to outlet to the JFTB at the southwest corner of the site, proposed flows from the project would not be allowed to outlet to the JFTB to the north of the site either since they are essentially the same outlet location. In addition, the existing site does not flow in the northerly Arbor Park/ JFTB area as the site drains in the southwesterly direction, therefore directing stormwater runoff to the north would change the historic drainage pattern which can potentially cause downstream flooding.

4. **Outlet Runoff to Golf Course to East:**
   The golf course to the east of the site is withinthe JFTB property and drains east, ultimately to the Bolsa Chica Channel. Discharging to the east does not match the historical drainage pattern and the Bolsa Chica Channel was not designed to accommodate flows from the site, therefore potentially cause downstream flooding. In addition, the golf course and Bolsa Chica Channel are upstream from the site, therefore not feasible due to elevation differences.

5. **Construct storm drain pipe in Lampson Avenue to East:**
   Discharging to the east does not match the historical drainage pattern and the Bolsa Chica Channel was not designed to accommodate flows from the site. Additionally, installation of underground storm drain pipe within Lampson Avenue is infeasible for same reasons as noted in #1 above. Similarly to item #4, changing the historical drainage pattern may potentially cause unforeseen drainage impacts.

Refer to the Proposed Conditions Hydrology Map located in Appendix A.2.

5.0 METHODOLOGY:

The existing/proposed subarea was analyzed for acreage, land-use, soil type, peak flow rate, and time of concentration according to the Rational Method.

Recommended perviousness values are based on existing and proposed land use.
Proposed conditions were analyzed using the rational method to determine the detention volume.

Rational Method Analysis identify offsite 25-year storm event flow allowed to prevent flooding of one travel lane of the half-street per Orange County Public Works Flood Local Drainage Manual.

Catch Basin Sizing
Catch basin Sizing will be analyzed for the 100-year storm event peak flow and provided during final engineering.

Pipe Sizing
Onsite underground storm drain pipe will be analyzed for the 100-year storm event peak flow rate utilizing WSPG software and provided during final engineering.

100-Year Water Surface Ponding Exhibit/ Calculations
Water surface elevations for the 100-year storm event peak flow rates will verify that the proposed building pad elevations are a minimum 1' above the water surface elevation. A ponding exhibit will be prepared based on the 100-year water surface elevation tributary to each subarea during final engineering.

Detention Calculations
Due to increased peak runoff flows created from the proposed change in land use and increased impervious coverage of the proposed development, stormwater will need to be detained to minimize and ultimately match existing conditions. A 24-hour inflow hydrograph and detention basin routing was analyzed to determine the amount of increased volume runoff to be minimized based on existing vs. proposed flows. However, the existing outlet pipe with headwall limits flow from the site similar to an orifice. Based on the maximum flows conveyed by the outlet pipe based on analyzing the pipe as an orifice, it appears the existing flows may overflow into Lampson Ave (Refer to Appendix C.2 for orifice calculations). To prevent overflow into Lampson Ave, the detention system shall be sized to match the maximum flows conveyed by the outlet pipe.

In addition, a proposed stormwater pump system with upstream detention storage has been incorporated into the onsite drainage design to provide onsite peak flow and volume minimization for the development for all storm events. The pump system will control the outflow discharge rate matching the existing 2-year peak flow at approximately 8.9 cfs. Refer to Appendix C.3 for detention calculations.

Lampson Avenue Street Capacity
An offsite street capacity analysis was performed for Lampson Avenue to determine the tributary area and corresponding peak flows. This information was utilized to determine the existing development is responsible of potential flooding of Lampson Avenue during larger storm events. Two (2) areas were analyzed; Section A-A is located near the southwest corner of the site and Section B-B at the existing low-point sump catch basin approximately 2,100 LF from the site near the Old Ranch Country Club. Both street capacity analysis indicate that the 100-year water surface elevation is held within the street and less than the existing top of curb elevations.

Refer to Appendix A.3 Offsite Existing Conditions Hydrology Map and Appendix C.5 for street capacity calculations.

7.0 CONCLUSION:

The results from this preliminary hydrology study demonstrate that the proposed condition of the project site will generate a higher peak runoff flowrate than the existing condition of the site due to an increase in impervious area and change in land use. The proposed detention facilities will be designed to detain at the flows and times indicated by the produced hydrographs in Appendix C.1.

Detained volumes will be discharged from the site via a pump system at flow rates that do not exceed the existing condition flow rates. Downstream facilities will not be hydrologically impacted by the proposed project site improvements. Existing historic drainage patterns will be maintained without causing the potential increase of tributary flooding. Proposed discharges from the development will not exceed the existing peak flow rates as described with the proposed conditions and alternative drainage system scenario.

8.0 DESIGN PARAMETERS:

1. The onsite drainage area was analyzed for a 10, 25, 100-year storm event using Rational Method Analysis per the County of Orange Hydrology Manual.

2. The drainage area is classified as Soil Group A (See Appendix E of this report). According to the Geotechnical Investigation report prepared by LGC Geotechnical, Inc. (dated December 21, 2021), the site is underlain by alluvial fan deposits to the maximum depth of 46.5' below existing grade. It consists of clay, clayey sand, silty clay, and silty sand. The soil is to be very moist to wet with depth and soft to stiff and medium dense to dense.

3. Assumed commercial and undeveloped cover for existing land use. A manning's "n" value of 0.040 is applied to undeveloped cover flow path and a value of 0.015 is applied to the concrete gutter.

4. Assumed apartments and condominium for proposed land use.

5. Time of concentration Tc were calculated by using the County of Orange Hydrology Manual to calculate flow rates and volume amounts.

6. There is no offsite run-on tributary to the site.

**** CONFLUENCE OF MINOR STREAMS ****
________________________________________________________________________
Along Main Stream number: 1 in normal stream number 2
Stream flow area =      2.150(Ac.)
Runoff from this stream =      8.019(CFS)
Time of concentration =    9.50 min.
Rainfall intensity =     4.284(In/Hr)
Area averaged loss rate (Fm) =    0.1400(In/Hr)
Area averaged Pervious ratio (Ap) = 0.3500
Summary of stream data:

Stream  Area  Flow rate      TC     Fm       Rainfall Intensity
 No.    (Ac.)   (CFS)       (min) (In/Hr)     (In/Hr)

1      9.96    34.904     11.26    0.140      3.886
2      2.15     8.019      9.50    0.140      4.284
Qmax(1) =
           1.000 *    1.000 *    34.904) +
           0.904 *    1.000 *     8.019) + =      42.153
Qmax(2) =
           1.106 *    0.844 *    34.904) +
           1.000 *    1.000 *     8.019) + =      40.591

Total of 2 streams to confluence:
Flow rates before confluence point:
      34.904       8.019
Maximum flow rates at confluence using above data:
       42.153       40.591
Area of streams before confluence:
        9.960        2.150
Effective area values after confluence:
       12.110       10.552
Results of confluence:
Total flow rate =     42.153(CFS)
Time of concentration =    11.257 min.
Effective stream area after confluence =     12.110(Ac.)
Study area average Pervious fraction(Ap) =  0.350
Study area average soil loss rate(Fm) =    0.140(In/Hr)
Study area total (this main stream) =      12.11(Ac.)
End of computations, total study area =           12.11 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.
Note: These figures do not consider reduced effective area
effects caused by confluences in the rational equation.

Area averaged pervious area fraction(Ap) = 0.350
```

Area averaged SCS curve number (AMC 2) = 32.0

C.4 Outlet Pipe Orifice Calculations

Submerged Outlet Pipe Analyzed as Orifice

Orifice 1 diameter =	24 IN
Invert elevation of orifice =	19.7 FT
Tailwater EGL =	21.7 FT

Q = flow [CFS] = KA(2gh)^0.5

K = orifice flow coefficient =	0.62
A = cross sectional area of orifice [SF] = 3.14 * r^2	3.140 SF
g = gravitational constant =	32.2 [FT/S^2]

h = hydraulic head [FT] = Headwater elev - Tailwater water surface elevation

Total System Outflow Table

Headwater Surface Elevation [FT]	Orifice Outflow [CFS]
21.7	0.00
22.2	11.05
22.7	15.62
23.2	19.13

CONSTRUCTION NOTES:

1. CONSTRUCT 12-INCH CLASS 350 CML DUCTILE IRON OR 12-INCH PVC CLASS 200, AWWA C900 WATERMAIN. TRENCH, BACKFILL AND PAVEMENT PER CITY OF SEAL BEACH STD. PLAN 711 AND 133. RUBBERIZED ASPHALT IS REQUIRED FOR TRENCH REPAIR (SEE NOTE 4)
2. CONSTRUCT 16-INCH CLASS 350 CML DUCTILE IRON OR 16-INCH PVC CLASS 200, AWWA C900 WATERMAIN. TRENCH, BACKFILL AND PAVEMENT PER CITY OF SEAL BEACH STD. PLAN 711 AND 133. RUBBERIZED ASPHALT IS REQUIRED FOR TRENCH REPAIR (SEE NOTE 4)
5. CONSTRUCT 12" RESILIENT WEDGE GATE VALVE (FLG x FLG) PER CITY OF SEAL BEACH STD. PLAN 706.
10. CONSTRUCT FIRE HYDRANT ASSEMBLY PER CITY OF SEAL BEACH STD. PLAN 705.
14. CONSTRUCT 16" 90° ELBOW AND THRUST BLOCK PER CITY OF SEAL BEACH STD. PLAN 712.
15. CONSTRUCT 16" x 12" DUCTILE IRON TEE (FLG x FLG) WITH THRUST BLOCK PER CITY OF SEAL BEACH STD. PLAN 712.
17. CONSTRUCT 16" 45° ELBOW (PO x PO) WITH THRUST BLOCK PER CITY OF SEAL BEACH STD. PLAN 712.
18. CONSTRUCT 16" CLASS 150 BUTTERFLY VALVE (FLG x MJ) PER CITY OF SEAL BEACH STD. PLAN 707.
23. CONSTRUCT 12" x 6" TEE (PO x FLG) WITH 6-INCH (FLG x PO) RESILIENT WEDGE GATE VALVE, FOR FUTURE FIRE HYDRANT ASSEMBLY. INSTALL THRUST BLOCKS PER CITY OF SEAL BEACH STD. PLANS 712.
24. CONSTRUCT 6-INCH PVC CLASS 200, AWWA C900 STUB OUT PER CITY OF SEAL BEACH STD. PLAN 711. INSTALL END CAP AND THRUST BLOCK 5-FEET BEYOND RIGHT-OF-WAY ON WELL SITE. REPAIR PAVEMENT PER CITY STD. PLAN 133.
25. REMOVE AND REPLACE EXISTING MEDIAN CURB TO NEAREST JOINT AS REQUIRED FOR CONSTRUCTION. REPLACE EXISTING LANDSCAPING AND IRRIGATION SYSTEM IN KIND.
26. CONSTRUCT 20 L.F. OF 24-INCH x ½" WALL STEEL CASING PER CITY OF SEAL BEACH STD. DWG. S-12 FILL CASING ANNULAR SPACE WITH LOW DENSITY GROUT. CENTER CASING UNDER SEWER.

SHEET NOTES:

1. CONTRACTOR SHALL POTHOLE TO VERIFY DEPTH, AND LOCATION OF ALL CONNECTION POINTS AND CROSSING UTILITIES PRIOR TO SUBMISSION OF SHOP DRAWINGS.
2. WORK IN LAMPSON AVE. REQUIRES A NO FEE ENCROACHMENT PERMIT FROM THE CITY OF SEAL BEACH. THE CONTRACTOR SHALL BE REQUIRED TO PREPARE AND SUBMIT A TRAFFIC CONTROL PLAN SIGNED AND SEALED BY A REGISTERED TRAFFIC CONTROL ENGINEER TO THE CITY OF SEAL BEACH FOR REVIEW AND APPROVAL.
3. THE CONTRACTOR SHALL EMPLOY HAND EXCAVATION ONLY WITHIN 3-FEET OF SCG FACILITIES. A REPRESENTATIVE OF THE GAS COMPANY MUST INSPECT ALL EXCAVATIONS NEAR EXISTING SCG FACILITIES. CONTRACTOR SHALL CONTACT SCG 2 WORKING DAYS PRIOR TO EXCAVATION TO COORDINATE INSPECTION.
4. CONTRACTOR BASE BID SHALL BE FOR FURNISHING AND INSTALLING DUCTILE IRON PIPE. PVC PIPE SHALL ONLY BE PROPOSED AS A BID ALTERNATIVE AND MAY BE IMPLEMENTED AT THE SOLE DISCRETION OF THE CITY.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Orange County and Part of Riverside County, California
Survey Area Data: Version 17, Aug 30, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Apr 14, 2022—Apr 23, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
158	Hueneme fine sandy loam, drained	19.3	100.0%
Totals for Area of Interest		**19.3**	**100.0%**

Orange County and Part of Riverside County, California

158—Hueneme fine sandy loam, drained

Map Unit Setting

National map unit symbol: hcn3
Elevation: 0 to 430 feet
Mean annual precipitation: 15 inches
Mean annual air temperature: 64 degrees F
Frost-free period: 300 to 350 days
Farmland classification: Prime farmland if irrigated

Map Unit Composition

Hueneme and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Hueneme

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Rise
Down-slope shape: Linear
Across-slope shape: Convex
Parent material: Stratified alluvium derived from sedimentary rock

Typical profile

H1 - 0 to 27 inches: fine sandy loam
H2 - 27 to 60 inches: stratified sand to silt loam

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Poorly drained
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum content: 1 percent
Maximum salinity: Very slightly saline to slightly saline (2.0 to 4.0 mmhos/cm)
Available water supply, 0 to 60 inches: Moderate (about 9.0 inches)

Interpretive groups

Land capability classification (irrigated): 1
Land capability classification (nonirrigated): 3c
Hydrologic Soil Group: A

Ecological site: R019XG911CA - Loamy Fan
Hydric soil rating: Yes

Minor Components

San emigdio, fine sandy loam
Percent of map unit: 5 percent
Hydric soil rating: No

Hueneme, fine sandy loam
Percent of map unit: 5 percent
Hydric soil rating: No

Bolsa, silt loam, drained
Percent of map unit: 5 percent
Hydric soil rating: No

This Preliminary Water Quality Management Plan (WQMP) has been prepared for MJW Investments by C&V Consulting, Inc. The WQMP is intended to comply with the requirements of the local NPDES Stormwater Program requiring the preparation of the plan.

The undersigned, while it owns the subject property, is responsible for the implementation of the provisions of this plan and will ensure that this plan is amended as appropriate to reflect up-to-date conditions on the site consistent with the current Orange County Drainage Area Management Plan (DAMP) and the intent of the non-point source NPDES Permit for Waste Discharge Requirements for the County of Orange, Orange County Flood Control District and the incorporated Cities of Orange County within the Santa Ana Region. Once the undersigned transfers its interest in the property, its successors-in-interest shall bear the aforementioned responsibility to implement and amend the WQMP. An appropriate number of approved and signed copies of this document shall be available on the subject site in perpetuity.

Section I Discretionary Permit(s) and Water Quality Conditions

Project Infomation			
Permit/Application No.	TBD	Tract/Parcel Map No.	PM2022-133, Parcel 1 & 2 (VTTM 19263, Lot 1)
Additional Information/ Comments:	4665 Lampson Avenue Los Alamitos, California 90720 APN: 130-012-35		
Water Quality Conditions			
Water Quality Conditions (list verbatim)	Conditions of Approval are not available at this time. This section will be completed as part of final engineering.		
Watershed-Based Plan Conditions			
Provide applicable conditions from watershed - based plans including WIHMPs and TMDLS.	TMDLs are listed for the water bodies Coyote Creek Channel for Copper, Lead, and Zinc. San Gabriel TMDLs are for Indicator Bacteria. These TMDLs have been adopted for Coyote Creek/ San Gabriel River by the Los Angeles Regional Water Quality Control Board (Region 4); however, it applies to the areas of Orange County that drain to the Coyote Creek and San Gabriel River.		

Section II Project Description

II.1 Project Description

Description of Proposed Project		
Development Category (Verbatim from MWQMP):	Priority Project Category for North Orange County: 8. All significant redevelopment projects, where significant redevelopment is defined as the addition or replacement of 5,000 or more square feet of impervious surface on an already developed site. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of the facility, or emergency redevelopment activity required to protect public health and safety. If the redevelopment results in the addition or replacement of less than 50 percent of the impervious area on-site and the existing development was not subject to WQMP requirement, the numeric sizing criteria discussed in Section 7.II-2.0 only applies to the addition or replacement area. If the addition or replacement accounts for 50 percent or more of the impervious area, the Project WQMP requirements apply to the entire development.	
Project Area (ft^2): 527,940*	Number of Dwelling Units: 246	SIC Code: n/a
Narrative Project Description:	The proposed project consists of approximately 12.12 acres (527,940tras square feet)* located at 4665 Lampson Avenue in the City of Los Alamitos, California. The site is bounded to the south by Lampson Avenue, to the east by a golf course, to the north by a park, and to the west by the Seal Beach Joint Forces Training base and vacant land. The site is currently occupied by the California Department of Fish and Wildlife with an associated parking lot and open space. The proposed site consists of 2 parcels per PM2022-133; Parcel 1 is being developed as Apartments and Parcel 2 (VTTM 19263, Lot 1) as for sale Townhomes. A combined drainage/ water quality system for both Parcel 1 and 2 has been incorporated into this Preliminary WQMP and support calculations. A drainage agreement between the 2 parcels for maintenance and access will be established as part of final engineering. Per the City of Los Alamitos General Plan dated March 2015, Existing Land Use exhibit the site is located within the General Office designation. According to the city of Los Alamitos Zoning Map the site is located within the C-F Community Facilities designation. There are two (2) existing driveways that provide access to the site from Lampson Avenue. Approximately 1/3 of the site consists of a paved parking lot. Along the	

west and northern property lines there is a drive aisle and head in parking that appears to serve the park to the north. The remainder of the site consists of a large building, associated concrete sidewalks, and a large grassy/ brush filled open space. The site is bounded on the North, West, and East Property lines with a chain link fence.

The existing building coverage is approximately 44,960 square feet, the existing landscaping coverage is approximately 340,276 square feet, and the AC coverage is 153,471 square feet.

There are three (3) driveways proposed to provide access to the development from Lampson Avenue; one (1) for Parcel 1 and two (2) for Parcel 2. The proposed development will consist of 76 buildings consisting of 2- and 3-story detached single family homes, 3 story townhomes, and 3 story apartment buildings for a total of 246 dwelling units.

The Single Family Detached buildings and the townhome buildings will have side-by-side parking and the apartment buildings will have tuck under parking on the first level.

The proposed building coverage is approximately 336,374 square feet, the drive aisle and open parking coverage is approximately 155,691 square feet, and the open space (public and private) lot coverage is approximately 46,641 square feet.

The site proposes 133 open parking spaces (69 for the apartment buildings and 69 for the townhomes and single family homes), 55 driveway parking spaces, and 368 garage parking spaces (30 for the apartment buildings and 338 for the townhomes and single family homes. The open space areas will be maintained by the appointed Homeowners Association (HOA).

The project proposes onsite private drive aisles, parking areas, hardscape and landscaped areas, and is accessed by two entrances along Lampson Avenue. Drive aisles and parking areas will consist of asphalt concrete pavement and sidewalks comprised of Portland concrete cement (PCC). Decorative hardscape is proposed within the walkways, common areas and portions of the drive aisles. Landscaping will be incorporated in open space areas including vegetation and street trees.

*Note that the project area excludes the proposed 10' dedication for the use of parks along the northern property line which consists of approximately 10,761 square feet.

Project Area	Pervious		Impervious	
	Area (acres or sq ft)	Percentage	Area (acres or sq ft)	Percentage
Pre-Project Conditions	7.18 ac	58%	5.19 AC	42%
Post-Project Conditions*	1.21 ac	10%	10.91	90%
Drainage Patterns/Connections	The existing site is generally flat and sheet flows to the south west towards Lampson Avenue. According to existing topography, the site elevations range from approximately 21.5 feet to 26.5 feet. Per the existing topography, the site elevations range from approximately 21 feet to 26 feet. The existing site generally flows in a north to south direction into an existing westerly flowing concrete channel along the site's southerly property line. The westerly flowing channel outlets to an existing 18" diameter corrugated metal pipe (CMP) with headwall that flows under the offsite driveway to Arbor Park and discharges into an offsite earthen channel on the west side of the park driveway. Stormwater runoff flows within this earthen channel converge with runoff flows from portions of Arbor Park and JFTB and are then collected by an existing 24" CMP that flows westerly through the Joint Forces Training Base (JFTB), then discharge into a westerly flowing earthen channel within the JFTB, and then drain to the Old Ranch Country Club to the south. Stormwater runoff is ultimately conveyed downstream into the San Gabriel River. Per C&V Consulting conducted field observations and existing topography, the existing concrete channel along the site's southerly property line currently ponds back to the existing driveway and overflows onto Lampson Avenue near the southwest corner of the site at the lowest elevation. Based on the existing topography of the site, in the event the outlet pipe were to become clogged, the existing overflows from the property would flow onto Lampson Avenue at the low point at the southwest corner of the site. Lampson Avenue street design is a flow-by condition along the project frontage, therefore any ponding or curb topping as discussed with City staff will likely occur downstream and designed sump condition near Old Ranch Country Club. Runoff appears to run along Lampson Avenue until it reaches an existing Orange County Flood Control Facility east of Seal Beach Boulevard. After entering this facility runoff is conveyed downstream into the San Gabriel River and eventually into the Pacific Ocean. The proposed residential development will be divided into seven (7) Drainage Management Areas (DMA) which will be graded to match the existing drainage condition. The storm water runoff will be collected and conveyed by a series of			

area drains and street flow, towards curb inlet bio-filtration vaults. The bio-filtration vaults will be equipped with an internal bypass that will allow runoff to bypass treatment when the treatment capacity is exceeded. Once through the biofiltration vault, runoff will be conveyed into an underground detention system that will detain the runoff. From the detention system, a stormwater sump pump located within the westerly drive aisle will discharge/ overflow to the existing 18" CMP at the southwest corner to the existing JFTB earthen channel. The detention system and pump will be sized so that the outlet flows from the developed site will be equal to, or less than, existing flows. In the event the stormwater pump fails or the outlet pipe becomes clogged, the emergency overflow for the site will flow onto Lampson Avenue matching historical overflow drainage patterns.

The downstream junction structure will be equipped with a Connector Pipe Screen (CPS) device for full trash capture of the 1-yr, 1-hr peak flow rate sized for the entire site to ensure trash collection prior to overflow. Refer to Attachment A for calculations and Attachment C for manufacturer's specifications.

<u>Alternative Drainage System Outlets to Lampson Avenue:</u>

There is no current cross lot drainage agreement between the JFTB and the subject property allowing for the proposed development's flows to outlet onto the JFTB. The JFTB controls all improvements on their property. If, for whatever reason, proposed flows from the project are not allowed to outlet to the JFTB, then an alternate design is proposed to outlet surface flows onto Lampson Avenue gutter via a parkway drain.

Due to existing flooding concerns on Lampson Avenue, the onsite detention and pump system will be designed to allow for low flows to enter Lampson Avenue up until the time that the flows begin to exceed the allowable Q25 on Lampson. Once the peak storm event flows have subsided and flows are no longer above the allowed Q25, it will resume pumping to Lampson Avenue.

Refer to Attachment B of this report for the Preliminary WQMP Exhibit.

Refer to Attachment D of this report for a copy of the OCFCD Drainage Facilities Maps.

Refer to separately prepared Hydrology Report for additional drainage information.

**Post-Project perviousness was assumed to be 10% to produce a conservative value for preliminary design. During final engineering, actual pervious coverage will be calculated as landscape plans become available. A thorough review will take place in the final design stages once an impervious percentage is determined and the BMP size may be affected due to the change.

II.2 Potential Stormwater Pollutants

Pollutants of Concern			
Pollutant	Circle One: E=Expected to be of concern N=Not Expected to be of concern		Additional Information and Comments
Suspended-Solid/ Sediment	E X	N	Tributary by proposed landscaped areas.
Nutrients	E X	N	Tributary by proposed landscaped areas.
Heavy Metals	E	N X	Per TGD, Table 2.1 this pollutant is not expected for attached residential developments.
Pathogens (Bacteria/Virus)	E X	N	Tributary by proposed residence and pets.
Pesticides	E X	N	Tributary by proposed landscaped areas.
Oil and Grease	E X	N	Tributary by uncovered parking areas.
Toxic Organic Compounds	E	N X	Per TGD, Table 2.1 this pollutant is nto expected for attached residential developments.
Trash and Debris	E X	N	Tributary by proposed residence.

II.3 Hydrologic Conditions of Concern

☒ No – Map shown in Attachment A

☐ Yes – Describe applicable hydrologic conditions of concern below. *Refer to Section 2.2.3 in the TGD.*

Refer to Attachment A of this report for a copy of the Susceptibility Analysis of San Gabriel-Coyote Creek, HCOC Map. The proposed drainage path of travel has been indicated by arrows on the map. Downstream waters are not considered susceptible to hydromodification.

II.4 Post Development Drainage Characteristics

The proposed residential development will be divided into seven (7) Drainage Management Areas (DMA) which will be graded to match the existing drainage condition. The storm water runoff will be collected and conveyed by a series of area drains and street flow, towards curb inlet bio-filtration vaults. These devices will be sized to treat the required stormwater runoff and have been designed conservatively. The bio-filtration chambers will contain an internal bypass to allow the conveyance of larger storm events. Once through the biofiltration vault, runoff will be conveyed into an underground detention system that will detain the runoff. From the detention system, a stormwater sump pump located in the southwest corner of the site will outlet flows into the existing 18" storm drain pipe at the southwest corner of the site to outlet to the JFTB. The detention system and pump will be sized so that the outlet flows from the developed site will be equal to, or less than, existing flows. In the event the stormwater pump fails or the outlet pipe becomes clogged, the emergency overflow for the site will flow onto Lampson Avenue matching historical drainage patterns.

Alternative Drainage System Outlets to Lampson Avenue:

There is no current cross lot drainage agreement between the JFTB and the subject property allowing for the proposed development's flows to outlet onto the JFTB. The JFTB controls all improvements on their property. If, for whatever reason, proposed flows from the project are not allowed to outlet to the JFTB, then an alternate design is proposed to outlet surface flows onto Lampson Avenue gutter via a parkway culvert.

Due to existing flooding concerns on Lampson Avenue, the onsite detention and pump system will be designed to allow for low flows to enter Lampson Avenue up until the time that the flows begin to exceed the allowable Q25 on Lampson. Once the peak storm event flows have subsided and flows are no longer above the allowed Q25, it will resume pumping to Lampson Avenue.

II.5 Property Ownership/Management

The proposed project will be maintained by an appointed Homeowners Association (HOA) selected by the Developer, MJW Investments, LLC. The HOA will be responsible for maintaining and providing regular inspections on the post-construction BMPs.

MJW Investments, LLC
27702 Crown Valley Parkway
Suite D-4-197
Ladera Ranch, Ca 92694

Section III Site Description

III.1 Physical Setting

Planning Area/ Community Name	n/a
Location/Address	4665 Lampson Avenue Los Alamitos, CA 90631
Land Use	Existing Land Use: General Office Proposed Land Use: Residential Multi-Family
Zoning	C-F Community Facilities
Acreage	12.12 ac
Predominant Soil Type	Soil Type A

III.2 Site Characteristics

Precipitation Zone	The site falls under the 0.8" per the TGD, Figure XVI-1, Rainfall Zones Map. Refer to Attachment A of this report for a copy of the map.
Topography	The site is generally flat and sheet flows to the south west towards Lampson Avenue. According to existing topography, the site elevations range from approximately 21.5 feet to 26.5 feet.
Drainage Patterns/Connections	According to existing topography runoff generally surface flows south and west onsite. There is an existing headwall near the eastern most existing driveway. It appears runoff from the adjacent onsite grass area is conveyed towards the headwall that connects to an open drainage channel that slopes to the west along the southern property line. The drainage channel terminates into an existing headwall at the southwest corner of the site. Existing onsite gutters convey runoff into the existing drainage channel. There are two existing trench drains in the two eastern driveways that appear to connect to the existing drainage channel as well. Runoff appears to run along Lampson Avenue until it reaches an existing Orange County Flood Control Facility east of Seal Beach Blvd. After entering this facility runoff is conveyed downstream into the San Gabriel River and eventually into the Pacific Ocean. The proposed drainage design will follow the existing drainage pattern with surface flows to onsite drainage facilities that will ultimately outlet into the existing headwall on the southwest corner of the site.
Soil Type, Geology, and Infiltration Properties	Per the Preliminary Geotechnical Evaluation and Design Recommendations Report prepared by LGC Geotechnical, Inc. Dated December 21, 2021, the site's geotechnical properties are described as the following: "Based on the results of our subsurface investigation, the site is underlain by a thin veneer of topsoil and older artificial fill over young alluvial deposits of Holocene age, per regional geologic mapping (USGS, 2016). The young alluvial sediments encountered during our subsurface exploration generally consist of interbedded layer of gray and brown, silty clay, clay silty sand, and clayey sand. The materials were observed to be very moist to wet with depth, soft to very stiff and medium dense to dense." "In general, our borings indicate the site is underlain by young alluvial fan deposits to the maximum explored depth of approximately 46.5 feet below existing grade. The material consists of clay, clayey sand, silty clay, and silty sand. The material was observed to be very moist to wet with depth and soft to stiff and medium dense to dense." Refer to Attachment F of this report for a copy of the Geotechnical Report.

Hydrogeologic (Groundwater) Conditions

Per the Preliminary Geotechnical Evaluation and Design Recommendations Report prepared by LGC Geotechnical, Inc. Dated December 21, 2021, the site's groundwater conditions are described as the following:

"*Groundwater was encountered in three of our borings (HS-1 through HS-3) at depths of approximately 11 to 13 feet below existing grade. Additionally, historic high groundwater is estimated to be about 10 feet below existing grade. The location and approximate depth of groundwater is summarized in Table 1 below.*

Boring Number	Total Drilled Depth of Boring (ft)	Groundwater Depth Below Existing Grade (ft)
HS-1	*21.5*	*13*
HS-2	*46.5*	*11.5*
HS-3	*21.5*	*11*

Seasonal fluctuations of groundwater elevations should be expected over time. In general, groundwater levels fluctuate with the seasons and local zones of perched groundwater may be present due to local seepage caused by irrigation and/ or recent precipitation. Local perched groundwater conditions or surface seepage may develop once site development is completed."

Refer to Attachment F of this report for a copy of the Geotechnical Report.

Geotechnical Conditions (relevant to infiltration)

Per the Preliminary Geotechnical Evaluation and Design Recommendations Report prepared by LGC Geotechnical, Inc. Dated December 21, 2021, the site's geotechnical infiltration properties are described as the following:

"Two field percolation tests were performed in locations and depths per the direction of the project civil engineer, the location is depicted on Figure 2 – Boring Location Map. Test well installation consisted of placing a 3-inch diameter perforated PVC pipe in the excavated 8-inch diameter borehole and backfilling the annulus with crushed rock including the placement of approximately 2 inches of crushed rock at the bottom of the borehole. The infiltration test wells were presoaked the day of installation and testing took place within 24 hours of presoaking. During the pre-test, the water level was observed to drop less than 6 inches in 25 minutes for two consecutive readings. Therefore, the test procedure for fine-grained soils or "slow test" was followed. Test well installation and the estimation of infiltration rates were accomplished in general accordance with the guidelines set forth by the County of Orange (2013). In general, three-dimensional flow out of the test well (percolation), as observed in the field, is mathematically reduced to one-dimensional flow out of the bottom of the test well (infiltration). Infiltration tests are performed using relatively clean water, free of particulates, silt, etc. The results of our recent field infiltration testing are presented in Appendix D and summarized below.

TABLE 2
Summary of Field Infiltration Testing

Infiltration Test *Identification*	**Approx. Depth Below Existing Grade (ft)**	**Observed Infiltration Rate* (in./hr.)**
I-1	5	**0.03**
I-2	**5**	**0.04**

*Observed Infiltration Rates Do Not Include Factor of Safety.

The tested infiltration rates provided in this report are considered a general representation of the infiltration rates at the location of the proposed infiltration boring. Please note, the testing of infiltration rates is highly dependent upon the materials encountered at the point of testing (i.e., location and depth of testing). Varying subsurface conditions may exist outside of the test location which could alter the calculated infiltration rate."

"Geotechnical stability and integrity of the project site is reliant upon appropriate handling of surface water. Due to the extremely low measured infiltration rate, low permeability fine-grained soils at depth, shallow groundwater and site liquefaction potential, we strongly recommend against the intentional infiltration of storm water into subsurface soils."

Refer to Attachment F of this report for a copy of the Geotechnical Report.

Per GeoTracker, there are no Leaking Underground Storage Tank (LUST) Cleanup Sites within 1,000 feet of the project site. There is a public water well operated by the City of Seal Beach approximately 1,800 feet west of the site. The well is listed as an active, raw groundwater well operated by the city of Seal Beach. Refer to Attachment F for the GeoTracker printout of the site.

Off-Site Drainage	The site does not experience any off-site run-on
Utility and Infrastructure Information	Utilities are proposed to be underground. No special setbacks are needed or proposed.

III.3 Watershed Description

Receiving Waters	The project site is located within the San Gabriel-Coyote Creek Watershed. The site discharges into the Federal Storm Channel, converges with the San Gabriel River and outlets to the Pacific Ocean.
303(d) Listed Impairments	San Gabriel River Estuary is listed for Copper, Dioxin, Indicator Bacteria, Nickel and Oxygen, Dissolved. San Pedro Bay Near/Off Shore Zones is listed for Chlordane, PCBs, Total DDT, Toxicity.
Applicable TMDLs	TMDLs are listed for the water bodies Coyote Creek Channel for Copper, Lead, and Zinc. San Gabriel TMDLs are for Indicator Bacteria. These TMDLs have been adopted for Coyote Creek/ San Gabriel River by the Los Angeles Regional Water Quality Control Board (Region 4); however, it applies to the areas of Orange County that drain to the Coyote Creek and San Gabriel River.
Pollutants of Concern for the Project	Suspended solid/ sediments, Nutrients, Pathogens (Bacteria/ Virus), Pesticides, Oil & Grease and Trash & Debris
Environmentally Sensitive and Special Biological Significant Areas	n/a

Section IV Best Management Practices (BMPs)

IV. 1 Project Performance Criteria

(NOC Permit Area only) Is there an approved WIHMP or equivalent for the project area that includes more stringent LID feasibility criteria or if there are opportunities identified for implementing LID on regional or sub-regional basis?		YES ☐	NO ☒
If yes, describe WIHMP feasibility criteria or regional/sub-regional LID opportunities.	n/a		

Project Performance Criteria (continued)	
If HCOC exists, list applicable hydromodification control performance criteria (Section 7.II-2.4.2.2 in MWQMP)	Per 7.II-2.4.2.2 of the Model WQMP, HCOC exists for when the post-construction time of concentration and volume of storm water increases beyond 5% of a 2-year storm event thus potentially increasing the downstream erosion and adversely impacts on physical structure, aquatic, and riparian habitat.
List applicable LID performance criteria (Section 7.II-2.4.3 from MWQMP)	Per 7.II-2.4.3 of the Model WQMP, the available LID Treatment BMPs to be utilized in reducing the post-development impacts include infiltration, harvest and use, evapotranspiration, or biotreat/biofilter, the 85^{th} percentile of a 24-hour storm event (Design Capture Volume).
List applicable treatment control BMP performance criteria (Section 7.II-3.2.2 from MWQMP)	Per 7.II-3.2.2 of the Model WQMP, if the LID performance criteria is not feasibly met by retention and/or biotreatment, then sizing of onsite treatment control BMPs are required. Sizing of these treatment control BMPs will include, if applicable any Water Quality credits as calculated per the Technical Guidance Document. The project proposes to satisfy LID performance criteria, therefore treatment control performance criteria is also fully satisfied.
Calculate LID design storm capture volume for Project.	The proposed project residential site will generate a total DCV of 29,213 cf. The DCV for each DMA was calculated as follows: DMA 1: V_{design} = 0.83*0.8*2.160 acres*43,560 (sf/acre)*(1 foot/12 inches) = 5,206 cf DMA 2: V_{design} = 0.83*0.8*2.093 acres*43,560 (sf/acre)*(1 foot/12 inches) = 5,045 cf DMA 3: V_{design} = 0.83*0.8*2.809 acres*43,560 (sf/acre)*(1 foot/12 inches) = 6,771 cf DMA 4: V_{design} = 0.83*0.8*1.806 acres*43,560 (sf/acre)*(1 foot/12 inches) = 4,352 cf DMA 5: V_{design} = 0.83*0.8*0.507 acres*43,560 (sf/acre)*(1 foot/12 inches) = 1,223 cf DMA 6: V_{design} = 0.83*0.8*0.504 acres*43,560 (sf/acre)*(1 foot/12 inches) = 1,214 cf DMA 7: V_{design} = 0.83*0.8*2.241 acres*43,560 (sf/acre)*(1 foot/12 inches) = 5,401 cf

	As flow-based Bio-filtration BMPs are proposed for project site. The design flowrates corresponding to surface flows from streets and drive aisles within each DMA were calculated as follows: DMA 1: Q_{design} = 0.83*0.26 (in/hr)*2.160 acres = 0.466 cfs DMA 2: Q_{design} = 0.83*0.26 (in/hr)*2.093 acres = 0.452 cfs DMA 3: Q_{design} = 0.83*0.26 (in/hr)*2.809 acres = 0.606 cfs DMA 4: Q_{design} = 0.83*0.26 (in/hr)*1.806 acres = 0.390 cfs DMA 5: Q_{design} = 0.83*0.26 (in/hr)*0.507 acres = 0.110 cfs DMA 6: Q_{design} = 0.83*0.26 (in/hr)*0.504 acres = 0.109 cfs DMA 7: Q_{design} = 0.83*0.26 (in/hr)*2.241 acres = 0.484 cfs * Refer to Worksheet B & Din Attachment A of this report.

IV.2. SITE DESIGN AND DRAINAGE PLAN

The site is divided into seven (7) Drainage Management Areas (DMA) as indicated on the Preliminary WQMP Exhibit. Each drainage area will have an area drain system to convey runoff from landscape and roof drainage along with curb inlet Modular Wetlands Systems to intercept surface runoff form surrounding walkways and drive aisles. The area drain system design for the project will be determined during final engineering and will connect directly to the proposed water quality treatment devices.

Stormwater runoff will be collected and conveyed through curb inlet Modular Wetlands Systems for water quality treatment of the Design Capture Volume (DCV). The overall project treatment flow rate for the site is 2.615 cfs, per Worksheet D in Attachment A of this report. Refer to the DMA Table below for area designation.

The Modular Wetland System (MWS) Biofiltration vaults are designed to provide a 3-phase treatment train. Initially, when the stormwater enters the system, a trash rack, filter media and settling chamber will capture large trash/ debris and sediment in the stormwater before entering the planting media. This system is designed to treat stormwater flow horizontally. Before the stormwater enters the planting or "wetland" chamber, the runoff flows through the 2nd phase, a pre-filter cartridge which captures fines TSS, metals, nutrients and bacteria. The pre-filter chamber eliminates additional maintenance of the planting area. The wetland chamber is the 3rd phase of the system which provides final treatment through a combination of physical, chemical and biological processes. Refer to Section IV.3.4 of this report for sizing information of the Biofiltration Vaults.

In the 7 DMAs, street runoff and landscape area runoff will be conveyed into the Modular Wetlands System where it will be treated for Water Quality. In the event that the design capture flowrate is exceeded, runoff will flow through the internal bypass and be conveyed into the underground detention system. The underground detention system meters flows offsite through an existing 18" storm drain pipe.

Treated runoff will discharge to the existing 18" CMP/ JFTB earthen channel matching historic drainage patterns, ultimately converging with the San Gabriel River which eventually outlets into the Pacific Ocean.

Drainage from upstream offsite areas that run onto the site will be collected and conveyed in separate underground storm drain pipes that will direct flows to overflow parkway drains to discharge into the existing 18" CMP. Offsite and onsite runoff flows will not co-mingle prior to onsite treatment runoff.

Drainage Management Areas (DMA) Table:

Refer to the Preliminary WQMP Exhibit within this report for referenced area designations.

Drainage Area No. (DMA)	Area (ac)	DCV (cf)	Design Flow Rate (cfs)	Proposed BMPs
1	2.15978	5,206	0.466	BIO-7 Biofiltration System
2	2.09320	5,045	0.452	BIO-7 Biofiltration System
3	2.80935	6,771	0.606	BIO-7 Biofiltration System
4	1.80556	4,352	0.390	BIO-7 Biofiltration System
5	0.50746	1,223	0.110	BIO-7 Biofiltration System

Other:	☐
Other:	☐

The entire DCV is being treated by Biotreatment BMPs. Harvested Water Demand and Feasibility assessment was performed per Worksheet J, which indicated that Evapotranspiration or Rainwater Harvesting BMPs are infeasible.

IV.3.4 Biotreatment BMPs

Name	Included?
Bioretention with underdrains	☐
Stormwater planter boxes with underdrains	☐
Rain gardens with underdrains	☐
Constructed wetlands	☐
Vegetated swales	☐
Vegetated filter strips	☐
Proprietary vegetated biotreatment systems	☒
Wet extended detention basin	☐
Dry extended detention basins	☐
Other:	☐
Other:	☐

Modular Wetland System (MWS) Biofiltration vaults will be utilized to treat runoff prior to discharging offsite. The MWS Biofiltration vaults utilize a 3-phase treatment train by collecting the stormwater runoff in a Pre-Treatment Chamber, Planting or "Wetland" Chamber and Discharge Chamber. Treated runoff outlets to existing Caltrans catch basins.

The MWS Biofiltration vaults were sized separately per DMA using the treatment flow rate method per the Orange County Technical Guidance Document worksheets. Note that the tributary treatment area used for MWS sizing calculations refers to the entire DMA. Landscape areas will have area drains to convey runoff through the MWS systems.

Refer to Worksheet D in Attachment A for calculations.

DMA	Acreage Tributary to Proposed Catch Basins (ac)	Design Flow Rate (cfs)	MWS Model	Treatment Capacity, Q (cfs)
1	2.15978	0.466	MWS-L-8-20-V	0.620
2	2.09320	0.452	MWS-L-8-16-C	0.462
3	2.80935	0.606	MWS-L-8-20-C	0.620
4	1.80556	0.390	MWS-L-8-16-C	0.462
5	0.50746	0.110	MWS-L-4-8-C	0.115
6	0.50365	0.109	MWS-L-4-8-C	0.115

7	2.24081	0.484	MWS-L-8-16-C	0.489
Total	12.12	2.615		2.725

** Project-specific details will be provided during final engineering. Refer to Attachment C for additional manufacturer information.*

Conclusion:

The utilization of a MWS Biofiltration vaults will provide more than the required pre-treatment flow rate for their tributary drainage areas.

N15	Street Sweeping Private Streets and Parking Lots	☒	☐	
N16	Retail Gasoline Outlets	☐	☒	Proposed residential project.

N1: Education for Property Owners, Tenants & Occupants

Project conditions of approval will require that the Homeowner's Association (HOA) periodically provide environmental awarness education materials, made available bt the municipalities, to all of its members. Among other things, these materials will be descrive the use of chemcials (including household type) that should be limited to the property, with no discharge of wastes via hosing or other direct discharge to gutters, catch basins and storm drains. Educational materials available from the County of Orange can be downloaded here:

http://www.ocwatersheds.com/PublicEd/resources/default.aspx

N2: Activity Restrictions

Conditions, covenants and restrictions (CC&Rs) must be prepared by the developer for the appointed HOA for the purpose of surface water quality protection. The CC&Rs shall incorporate the restrictions based on the Project WQMP.

N3: Common Area Landscape Management

All common landscaping and/ or open space areas shall have on-going landscape maintenance by an appointed professional landscaping maintenance company as selected by the HOA. Maintenance shall incorporate all current County Water Conservation Resolution usage and follow the Management Guidelines for Use of Fertilizers per the DAMP Section 5.5. Refer to Section 5 of this report for additional landscape maintenance requirements.

N4: BMP Maintenance

Refer to Section 5 and Attachment C of this report for additional non-structural BMP maintenance requirements, responsibility and frequency.

N5: Title 22 CCR Compliance

HOA is responsible for compliance with Title 22 of the California Code of Regulations (CCR) and relevant sections of the California Health & Safety Code regarding hazardous waste management is enforced by the County Environmental Heath and behalf of the State. Inforamtion regarding hazardous waste management must be provided to all employees, homeowners, tenants and occupants.

N10: Uniform Fire Code Implementation

HOA is responsible for compliance with Article 80 of the Uniform Fire Code enforced by the local fire protection agency.

N11: Common Area Litter Control

HOA to implement trash management and litter control procedures in the common areas aimed at reducing pollution of drainage water. HOA to contract with landscape maintenance company to provide this service during regularly scheduled maintenance, which will consist of litter patrol,

emptying of trash receptacles in common areas, and noting trash disposals violations by homeowners, tenants or occupants and reporting the violations to the HOA for investigation.

N12: Employee Training

HOA to provide Educational Materials and Property Management manuals to all employees upon initial hiring. Any updated information shall be provided to employees within a timely manner along with information on implementation.

N14: Common Area Catch Basin Inspections

HOA to inspect, clean and repair common area catch basins within the development to verify that the private drainage system is working properly. All trash/ debris and sediment build up is removed and any repairs/ replacements are conducted. Cleaning should take place in late summer/ early fall prior to the start of the raining season. Drainage facilities include catch basins (storm drain inlets), detention basins, retention basins, sediment basins, open drainage channels, area drains, and lift stations. Records shall be kept onsite to document the annual maintenance.

N15: Street Sweeping of Private Streets & Parking Lots

HOA to schedule at a minimum street sweeping of private streets and parking areas prior to the start of the rainy seasons, in late summer or early fall. Additional sweeping may be required to remove landscaping foliage and/ or pollution.

IV.3.9 Structural Source Control BMPs

Structural Source Control BMPs				
Identifier	**Name**	**Check One**		**If not applicable, state brief reason**
		Included	**Not Applicable**	
S1	Provide storm drain system stenciling and signage	☒	☐	
S2	Design and construct outdoor material storage areas to reduce pollution introduction	☐	☒	No proposed outdoor storage areas.
S3	Design and construct trash and waste storage areas to reduce pollution introduction	☒	☐	
S4	Use efficient irrigation systems & landscape design, water conservation, smart controllers, and source control	☒	☐	
S5	Protect slopes and channels and provide energy dissipation	☐	☒	No proposed slopes/channels to be protected.
	Incorporate requirements applicable to individual priority project categories (from SDRWQCB NPDES Permit)	☐	☒	n/a
S6	Dock areas	☐	☒	Proposed residential project.
S7	Maintenance bays	☐	☒	Proposed residential project.
S8	Vehicle wash areas	☐	☒	No proposed vehicle wash areas.
S9	Outdoor processing areas	☐	☒	Proposed residential project.
S10	Equipment wash areas	☐	☒	Proposed residential project.
S11	Fueling areas	☐	☒	Proposed residential project.
S12	Hillside landscaping	☐	☒	Project not located within hillside area.
S13	Wash water control for food preparation areas	☐	☒	Proposed residential project.
S14	Community car wash racks	☐	☒	No proposed community car washing areas.

S1 (SD-13): Provide Storm Drain System Stenciling

Phrase "No Dumping – Drains to Ocean" or equally effective phrase to be stenciled on catch basins to alert the public of the destination of pollutants discharged into storm water. This stenciling will be inspected and re-stenciled on a periodic basis by HOA.

Refer to CASQA BMP Fact Sheet SD-13 for additional information.

S4 (SD-12): Use Efficient Irrigation Systems & Landscape Design

HOA shall implement the timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the storm drain systems. HOA to implement the following methods to reduce excessive irrigation water runoff, where applicable:

- Employ rain shutoff devices to prevent irrigation after precipitation
- Utilizing landscape specific irrigation water requirements
- Utilize flow reducers or shutoff valves triggered by pressure drop to control water loss due to broken sprinkler heads
- Implement landscaping practices per the County Water Conservation Resolution or City agency equivalent
- Group plants or landscaping with similar water consumption in order to promote surface infiltration

Refer to CASQA BMP Fact Sheet SD-12 for additional information.

IV.4 ALTERNATIVE COMPLIANCE PLAN (IF APPLICABLE)

IV.4.1 Water Quality Credits

<table>
<tr><th colspan="5">Description of Proposed Project</th></tr>
<tr><td colspan="5">Project Types that Qualify for Water Quality Credits (Select all that apply):</td></tr>
<tr><td colspan="2">☐Redevelopment projects that reduce the overall impervious footprint of the project site.</td><td colspan="2">☐Brownfield redevelopment, meaning redevelopment, expansion, or reuse of real property which may be complicated by the presence or potential presence of hazardous substances, pollutants or contaminants, and which have the potential to contribute to adverse ground or surface WQ if not redeveloped.</td><td>☐ Higher density development projects which include two distinct categories (credits can only be taken for one category): those with more than seven units per acre of development (lower credit allowance); vertical density developments, for example, those with a Floor to Area Ratio (FAR) of 2 or those having more than 18 units per acre (greater credit allowance).</td></tr>
<tr><td colspan="2">☐ Mixed use development, such as a combination of residential, commercial, industrial, office, institutional, or other land uses which incorporate design principles that can demonstrate environmental benefits that would not be realized through single use projects (e.g. reduced vehicle trip traffic with the potential to reduce sources of water or air pollution).</td><td colspan="2">☐ Transit-oriented developments, such as a mixed use residential or commercial area designed to maximize access to public transportation; similar to above criterion, but where the development center is within one half mile of a mass transit center (e.g. bus, rail, light rail, or commuter train station). Such projects would not be able to take credit for both categories, but may have greater credit assigned</td><td>☐ Redevelopment projects in an established historic district, historic preservation area, or similar significant city area including core City Center areas (to be defined through mapping).</td></tr>
<tr><td>☐Developments with dedication of undeveloped portions to parks, preservation areas and other pervious uses.</td><td>☐ Developments in a city center area.</td><td>☐ Developments in historic districts or historic preservation areas.</td><td>☐ Live-work developments, a variety of developments designed to support residential and vocational needs together – similar to criteria to mixed use development; would not be able to take credit for both categories.</td><td>☐In-fill projects, the conversion of empty lots and other underused spaces into more beneficially used spaces, such as residential or commercial areas.</td></tr>
<tr><td>Calculation of Water Quality Credits
(if applicable)</td><td colspan="4">The entire DCV is being treated by LID BMPs. Water quality credits will not be used.</td></tr>
</table>

IV.4.2 Alternative Compliance Plan Information

n/a

Section V Inspection/Maintenance Responsibility for BMPs

Currently the owner of the property is the California Department of Fish and Wildlife. Upon completion of entitlement, during the process of final engineering, ownership will be transferred to MJW Investments, LLC. Ultimately, the property owner will be responsible for establishing a Homeowner's Association (HOA) for long term BMP operation and maintenance. The owner is aware of the maintenance responsibilities of the proposed BMPs. A funding mechanism is in place to establish an HOA to maintain the BMPs at the frequency stated in the WQMP. Contact information will be updated as part of final engineering.

If ownership is transferred at a later date other than who is listed within the Final report, completion of a Notice of Transfer of Responsibility form is required. A blank form is provided in Attachment G of this report.

For preliminary purposes, MJW Investments will be responsible for the BMP maintenance until the project is sold and/ or transferred to a new Owner, HOA.

MJW Investments, LLC
27702 Crown Valley Parkway
Suite D-4-197
Ladera Ranch, Ca 92694

The following BMP Inspection/ Maintenance table will be completed as part of the final engineering. This table will include BMP description, responsible party(ies), required inspection/ maintenance routine and frequency.

BMP Inspection/Maintenance			
BMP	**Reponsible Party(s)**	**Inspection/ Maintenance Activities Required**	**Minimum Frequency of Activities**
Education for Property Owners, Tenants, Occupants & Employees	Homeowner's Association (HOA)	HOA to provide education material, a copy of the approved WQMP and Operation & Maintenance Plan (O&M) to new property owners, tenants, occupants & employees.	As needed.
Activity Restrictions	HOA	HOA notified of activities that are prohibited by homeowners.	Restrictions identified in Employee Manual and reviewed yearly by employees.
Common Area Landscape Management	HOA	HOA to hire professional landscape company to conduct maintenance of landscaping to meet current water efficiency and keep plants healthy and bio areas maintained with proper soil amendments.	Regular maintenance once a week and monthly inspection to determine deficiencies
Title 22 CCR Compliance	HOA	HOA to comply with Title 22 of the California Code of Regulations (CCR), relevant California Health & Safety Code and keep informed of the latest	As needed.

		requirements. Information regarding hazardous waste management must be provided to all employees, homeowners, tenants & occupants.	
Uniform Fire Code Implementation	HOA	HOA to comply with fire regulations and keep informed of the latest rules and requirements.	Comply with annual fire inspections and maintain building and access per the latest fire codes.
Common Area Litter Control	HOA	HOA to provide litter removal of site parking lot and landscape areas.	Once per week.
Employee Training	HOA	HOA to provide Educational Materials and Property Management manuals to all employees upon initial hiring. Any updated information shall be provided to employees in a timely manner.	As needed.
Common Area Catch Basin Inspections	HOA	HOA to inspect, clean and repair common area catch basins to verify private drainage system functioning properly.	80% of drainage facilities to be inspected, cleaned and maintained on an annual basis and 100% in a two-year period.

Private Street & Parking Lot Sweeping	HOA	HOA to provide maintenance of Parking Lot.	Regular Parking Lot sweeping once a week.
Storm Drain Stencilling and Signage	HOA	HOA to provide maintenance of storm drain stencilling and signage.	Once every 6 months, inspect for re-stencilling needs. Re-stencil as needed immediately.
Use efficient irrigation systems & landscape design, water conservation, smart controllers, and source control	HOA	HOA to provide maintenance of landscaping to meet current water efficiency standards and keep plants healthily.	Regular maintenance once a week and monthly inspection to determine deficiencies.
Connector Pipe Screen (CPS) Device (Full Trash Capture)	HOA	HOA inspect, clean, and/ or replace device per manufacturer's speciation's.	Regular maintenance before rainy season (October 1st). Inspect and clean at least twice per year.
Modular Wetlands Biofiltration systems	HOA	HOA to provide maintenance of systems. Remove trash debris and sediment accumulation after storm events. Replace media as required. Repair as needed.	Regular maintenance before rainy season (October 1st). Inspect and clean at least twice per year.

Modular Trough Diversion System	HOA	HOA to inspect system and schedule maintenance when deficiencies are noted. Area near system to be kept free of debris and cleanings shall be scheduled to remove silt from trough as needed	Inspections should occur at least two times per year and one of the inspection must be before the start of the rainy season (October 1st).

Section VI Site Plan and Drainage Plan

VI.1 SITE PLAN AND DRAINAGE PLAN

Include a site plan and drainage plan sheet set containing the following minimum information:

- Project location
- Site boundary
- Land uses and land covers, as applicable
- Suitability/feasibility constraints
- Structural BMP locations
- Drainage delineations and flow information
- Drainage connections
- BMP details

Section VII Educational Materials

Refer to the Orange County Stormwater Program (ocwatersheds.com) for a library of materials available. For the copy submitted to the Permittee, only attach the educational materials specifically applicable to the project. Other materials specific to the project may be included as well and must be attached.

Orange County Technical Guidance Document
Worksheets and Figures

Table 2.7: Infiltration BMP Feasibility Worksheet

	Infeasibility Criteria	***Yes***	***No***
1	**Would Infiltration BMPs pose significant risk for groundwater related concerns?** Refer to Appendix VII (Worksheet I) for guidance on groundwater-related infiltration feasibility criteria.	X	
Provide basis: Per the preliminary Geotechnical Evaluation and Design Recommendations Report prepared by LGC Geotechnical, Inc dated December 21, 2021: "Geotechnical stability and integrity of the project site is reliant upon appropriate handling of surface water. Due to the extremely low measured infiltration rate, low permeability fine-grained soils at depth, shallow groundwater and site liquefaction potential, we strongly recommend against the intentional infiltration of storm water into subsurface soils."			
2	Would Infiltration BMPs **pose significant risk of increasing risk of geotechnical hazards that cannot be mitigated to an acceptable level**? (Yes if the answer to any of the following questions is yes, as established by a geotechnical expert): • The BMP can only be located less than 50 feet away from slopes steeper than 15 percent • The BMP can only be located less than eight feet from building foundations or an alternative setback. • A study prepared by a geotechnical professional or an available watershed study substantiates that stormwater infiltration would potentially result in significantly increased risks of geotechnical hazards that cannot be mitigated to an acceptable level.		X
Provide basis:			
3	Would infiltration of the DCV from drainage area **violate downstream water rights**?		X
Provide basis:			

Table 2.7: Infiltration BMP Feasibility Worksheet (continued)

	Partial Infeasibility Criteria	***Yes***	***No***
4	Is proposed infiltration facility **located on HSG D soils** or the site geotechnical investigation identifies presence of soil characteristics which support categorization as D soils?		X
Provide basis:			
5	Is **measured infiltration rate below proposed facility less than 0.3 inches per hour**? This calculation shall be based on the methods described in Appendix VII.	X	
Provide basis:			
6	Would **reduction of over predeveloped conditions cause impairments to downstream beneficial uses, such as change of seasonality of ephemeral washes or increased discharge of contaminated groundwater to surface waters?**		X
Provide citation to applicable study and summarize findings relative to the amount of infiltration that is permissible:			
7	Would **an increase in infiltration over predeveloped conditions cause impairments to downstream beneficial uses, such as change of seasonality of ephemeral washes or increased discharge of contaminated groundwater to surface waters?**		X
Provide citation to applicable study and summarize findings relative to the amount of infiltration that is permissible:			

Table 2.7: Infiltration BMP Feasibility Worksheet (continued)

Infiltration Screening Results (check box corresponding to result):		
8	Is there substantial evidence that infiltration from the project would result in a significant increase in I&I to the sanitary sewer that cannot be sufficiently mitigated? (See Appendix XVII) Provide narrative discussion and supporting evidence:	No
9	If any answer from row 1-3 is yes: infiltration of any volume is **not feasible** within the DMA or equivalent. Provide basis:	Yes
10	If any answer from row 4-7 is yes, infiltration is **permissible but is not presumed to be feasible for the entire DCV.** Criteria for designing biotreatment BMPs to achieve the maximum feasible infiltration and ET shall apply. Provide basis:	No
11	If all answers to rows 1 through 11 are no, infiltration of the full DCV is potentially feasible, BMPs must be designed to infiltrate the full DCV to the maximum extent practicable.	Infiltration is Infeasible

Worksheet B: Simple Design Capture Volume Sizing Method

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter design capture storm depth from Figure III.1, *d* (inches)	d=	0.80	inches
2	Enter the effect of provided HSCs, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
3	Calculate the remainder of the design capture storm depth, $d_{remainder}$ (inches) (Line 1 – Line 2)	$d_{remainder}$=	0.80	inches
Step 2: Calculate the DCV				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	2.862	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9	
3	Calculate runoff coefficient, *C= (0.75 x imp) + 0.15*	C=	0.83	
4	Calculate runoff volume, V_{design}= *(C x* $d_{remainder}$ *x A x 43560 x (1/12))*	V_{design}=	6,856	cu-ft
Step 3: Design BMPs to ensure full retention of the DCV				
Step 3a: Determine design infiltration rate			**N/A**	
1	Enter measured infiltration rate, $K_{measured}$ (in/hr) (Appendix VII)	$K_{measured}$=	NA	In/hr
2	Enter combined safety factor from Worksheet H, S_{final} (unitless)	S_{final}=	NA	
3	Calculate design infiltration rate, $K_{design} = K_{measured} / S_{final}$	K_{design}=	NA	In/hr
Step 3b: Determine minimum BMP footprint				
4	Enter drawdown time, *T* (max 48 hours)	T=	NA	Hours
5	Calculate max retention depth that can be drawn down within the drawdown time (feet), $D_{max} = K_{design} \times T \times (1/12)$	D_{max}=	NA	feet
6	Calculate minimum area required for BMP (sq-ft), $A_{min} = V_{design} / d_{max}$	A_{min}=	NA	sq-ft

Worksheet B: Simple Design Capture Volume Sizing Method

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter design capture storm depth from Figure III.1, *d* (inches)	d=	0.8	inches
2	Enter the effect of provided HSCs, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
3	Calculate the remainder of the design capture storm depth, $d_{remainder}$ (inches) (Line 1 – Line 2)	$d_{remainder}$=	0.8	inches
Step 2: Calculate the DCV				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	2.018	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9	
3	Calculate runoff coefficient, $C= (0.75 \times imp) + 0.15$	C=	0.83	
4	Calculate runoff volume, $V_{design}= (C \times d_{remainder} \times A \times 43560 \times (1/12))$	V_{design}=	4,836	cu-ft
Step 3: Design BMPs to ensure full retention of the DCV				
Step 3a: Determine design infiltration rate			**N/A**	
1	Enter measured infiltration rate, $K_{measured}$ (in/hr) (Appendix VII)	$K_{measured}$=	NA	In/hr
2	Enter combined safety factor from Worksheet H, S_{final} (unitless)	S_{final}=	NA	
3	Calculate design infiltration rate, $K_{design} = K_{measured} / S_{final}$	K_{design}=	NA	In/hr
Step 3b: Determine minimum BMP footprint				
4	Enter drawdown time, *T* (max 48 hours)	T=	NA	Hours
5	Calculate max retention depth that can be drawn down within the drawdown time (feet), $D_{max} = K_{design} \times T \times (1/12)$	D_{max}=	NA	feet
6	Calculate minimum area required for BMP (sq-ft), $A_{min} = V_{design} / d_{max}$	A_{min}=	NA	sq-ft

Worksheet B: Simple Design Capture Volume Sizing Method

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter design capture storm depth from Figure III.1, *d* (inches)	d=	0.8	inches
2	Enter the effect of provided HSCs, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
3	Calculate the remainder of the design capture storm depth, $d_{remainder}$ (inches) (Line 1 – Line 2)	$d_{remainder}$=	0.8	inches
Step 2: Calculate the DCV				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	2.144	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9	
3	Calculate runoff coefficient, *C= (0.75 x imp) + 0.15*	C=	0.83	
4	Calculate runoff volume, V_{design}= *(C x* $d_{remainder}$ *x A x 43560 x (1/12))*	V_{design}=	5,136	cu-ft
Step 3: Design BMPs to ensure full retention of the DCV				
Step 3a: Determine design infiltration rate			**N/A**	
1	Enter measured infiltration rate, $K_{measured}$ (in/hr) (Appendix VII)	$K_{measured}$=	NA	In/hr
2	Enter combined safety factor from Worksheet H, S_{final} (unitless)	S_{final}=	NA	
3	Calculate design infiltration rate, $K_{design} = K_{measured} / S_{final}$	K_{design}=	NA	In/hr
Step 3b: Determine minimum BMP footprint				
4	Enter drawdown time, *T* (max 48 hours)	T=	NA	Hours
5	Calculate max retention depth that can be drawn down within the drawdown time (feet), $D_{max} = K_{design} \times T \times (1/12)$	D_{max}=	NA	feet
6	Calculate minimum area required for BMP (sq-ft), $A_{min} = V_{design} / d_{max}$	A_{min}=	NA	sq-ft

Worksheet B: Simple Design Capture Volume Sizing Method

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter design capture storm depth from Figure III.1, *d* (inches)	d=	0.8	inches
2	Enter the effect of provided HSCs, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
3	Calculate the remainder of the design capture storm depth, $d_{remainder}$ (inches) (Line 1 – Line 2)	$d_{remainder}$=	0.8	inches
Step 2: Calculate the DCV				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	1.935	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9	
3	Calculate runoff coefficient, *C= (0.75 x imp) + 0.15*	C=	0.83	
4	Calculate runoff volume, V_{design}= *(C x* $d_{remainder}$ *x A x 43560 x (1/12))*	V_{design}=	4,637	cu-ft
Step 3: Design BMPs to ensure full retention of the DCV				
Step 3a: Determine design infiltration rate			**N/A**	
1	Enter measured infiltration rate, $K_{measured}$ (in/hr) (Appendix VII)	$K_{measured}$=	NA	In/hr
2	Enter combined safety factor from Worksheet H, S_{final} (unitless)	S_{final}=	NA	
3	Calculate design infiltration rate, $K_{design} = K_{measured} / S_{final}$	K_{design}=	NA	In/hr
Step 3b: Determine minimum BMP footprint				
4	Enter drawdown time, *T* (max 48 hours)	T=	NA	Hours
5	Calculate max retention depth that can be drawn down within the drawdown time (feet), $D_{max} = K_{design} \times T \times (1/12)$	D_{max}=	NA	feet
6	Calculate minimum area required for BMP (sq-ft), $A_{min} = V_{design} / d_{max}$	A_{min}=	NA	sq-ft

Worksheet B: Simple Design Capture Volume Sizing Method

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter design capture storm depth from Figure III.1, *d* (inches)	d=	0.8	inches
2	Enter the effect of provided HSCs, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
3	Calculate the remainder of the design capture storm depth, $d_{remainder}$ (inches) (Line 1 – Line 2)	$d_{remainder}$=	0.8	inches
Step 2: Calculate the DCV				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	0.476	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9	
3	Calculate runoff coefficient, *C= (0.75 x imp) + 0.15*	C=	0.83	
4	Calculate runoff volume, V_{design}= *(C x* $d_{remainder}$ *x A x 43560 x (1/12))*	V_{design}=	1,140	cu-ft
Step 3: Design BMPs to ensure full retention of the DCV				
Step 3a: Determine design infiltration rate			**N/A**	
1	Enter measured infiltration rate, $K_{measured}$ (in/hr) (Appendix VII)	$K_{measured}$=	NA	In/hr
2	Enter combined safety factor from Worksheet H, S_{final} (unitless)	S_{final}=	NA	
3	Calculate design infiltration rate, $K_{design} = K_{measured} / S_{final}$	K_{design}=	NA	In/hr
Step 3b: Determine minimum BMP footprint				
4	Enter drawdown time, *T* (max 48 hours)	T=	NA	Hours
5	Calculate max retention depth that can be drawn down within the drawdown time (feet), $D_{max} = K_{design} \times T \times (1/12)$	D_{max}=	NA	feet
6	Calculate minimum area required for BMP (sq-ft), $A_{min} = V_{design} / d_{max}$	A_{min}=	NA	sq-ft

Worksheet B: Simple Design Capture Volume Sizing Method

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter design capture storm depth from Figure III.1, *d* (inches)	d=	0.8	inches
2	Enter the effect of provided HSCs, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
3	Calculate the remainder of the design capture storm depth, $d_{remainder}$ (inches) (Line 1 – Line 2)	$d_{remainder}$=	0.8	inches
Step 2: Calculate the DCV				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	0.439	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9	
3	Calculate runoff coefficient, *C= (0.75 x imp) + 0.15*	C=	0.83	
4	Calculate runoff volume, V_{design}= *(C x* $d_{remainder}$ *x A x 43560 x (1/12))*	V_{design}=	1,052	cu-ft
Step 3: Design BMPs to ensure full retention of the DCV				
Step 3a: Determine design infiltration rate			**N/A**	
1	Enter measured infiltration rate, $K_{measured}$ (in/hr) (Appendix VII)	$K_{measured}$=	NA	In/hr
2	Enter combined safety factor from Worksheet H, S_{final} (unitless)	S_{final}=	NA	
3	Calculate design infiltration rate, $K_{design} = K_{measured} / S_{final}$	K_{design}=	NA	In/hr
Step 3b: Determine minimum BMP footprint				
4	Enter drawdown time, *T* (max 48 hours)	T=	NA	Hours
5	Calculate max retention depth that can be drawn down within the drawdown time (feet), $D_{max} = K_{design} \times T \times (1/12)$	D_{max}=	NA	feet
6	Calculate minimum area required for BMP (sq-ft), $A_{min} = V_{design} / d_{max}$	A_{min}=	NA	sq-ft

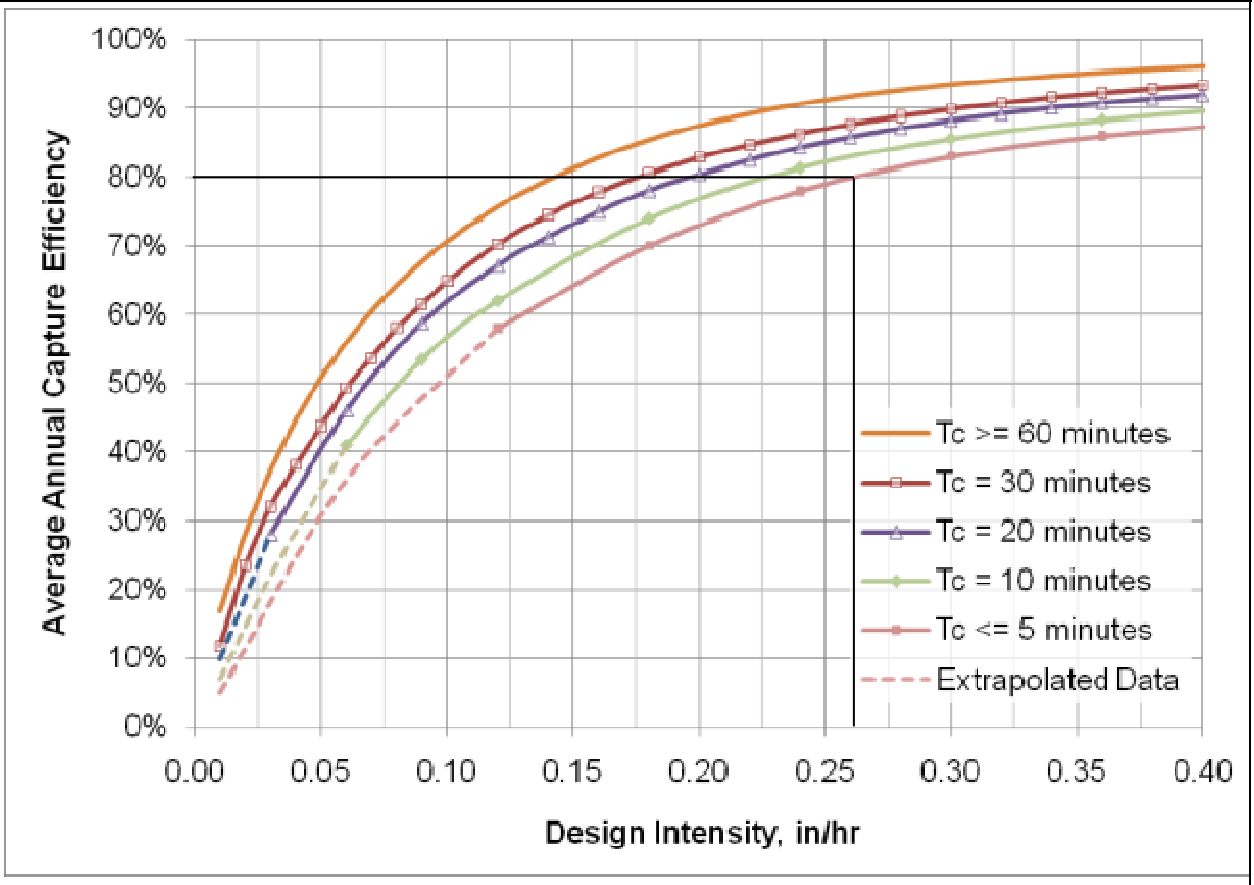
Worksheet B: Simple Design Capture Volume Sizing Method

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter design capture storm depth from Figure III.1, *d* (inches)	d=	0.8	inches
2	Enter the effect of provided HSCs, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
3	Calculate the remainder of the design capture storm depth, $d_{remainder}$ (inches) (Line 1 – Line 2)	$d_{remainder}$=	0.8	inches
Step 2: Calculate the DCV				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	2.246	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9	
3	Calculate runoff coefficient, $C= (0.75 \times imp) + 0.15$	C=	0.83	
4	Calculate runoff volume, $V_{design}= (C \times d_{remainder} \times A \times 43560 \times (1/12))$	V_{design}=	5,381	cu-ft
Step 3: Design BMPs to ensure full retention of the DCV				
Step 3a: Determine design infiltration rate			**N/A**	
1	Enter measured infiltration rate, $K_{measured}$ (in/hr) (Appendix VII)	$K_{measured}$=	NA	In/hr
2	Enter combined safety factor from Worksheet H, S_{final} (unitless)	S_{final}=	NA	
3	Calculate design infiltration rate, $K_{design} = K_{measured} / S_{final}$	K_{design}=	NA	In/hr
Step 3b: Determine minimum BMP footprint				
4	Enter drawdown time, *T* (max 48 hours)	T=	NA	Hours
5	Calculate max retention depth that can be drawn down within the drawdown time (feet), $D_{max} = K_{design} \times T \times (1/12)$	D_{max}=	NA	feet
6	Calculate minimum area required for BMP (sq-ft), $A_{min} = V_{design} / d_{max}$	A_{min}=	NA	sq-ft

Worksheet D: Capture Efficiency Method for Flow-Based BMPs

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter the time of concentration, T_c (min) (See Appendix IV.2)	T_c=	5.00	
2	Using Figure III.4, determine the design intensity at which the estimated time of concentration (T_c) achieves 80% capture efficiency, I_1	I_1=	0.26	in/hr
3	Enter the effect depth of provided HSCs upstream, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
4	Enter capture efficiency corresponding to d_{HSC}, Y_2 (Worksheet A)	Y_2=	0	%
5	Using Figure III.4, determine the design intensity at which the time of concentration (T_c) achieves the upstream capture efficiency(Y_2), I_2	I_2=	0	in/hr
6	Determine the design intensity that must be provided by BMP, $I_{design} = I_1 - I_2$	I_{design}=	0.26	in/hr
Step 2: Calculate the design flowrate				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	2.862	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9 *	
3	Calculate runoff coefficient, $C = (0.75 \times imp) + 0.15$	C=	0.83	
4	Calculate design flowrate, $Q_{design} = (C \times i_{design} \times A)$	Q_{design}=	0.614	cfs

Supporting Calculations



Describe system:
Surface runoff will be conveyed through the private street to proposed curb inlet Biofiltration Vaults for water quality treatment.

*Assumed 90% impervious coverage utilized for preliminary calculations. Actual impervious coverage will be calculated in final engineering.

Provide time of concentration assumptions:
The time of concentration was assumed to be 5 minutes for conservative purposes.

Worksheet D: Capture Efficiency Method for Flow-Based BMPs

Graphical Operations

Provide supporting graphical operations. See Example III.7.

Worksheet D: Capture Efficiency Method for Flow-Based BMPs

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter the time of concentration, T_c (min) (See Appendix IV.2)	T_c=	5.00	
2	Using Figure III.4, determine the design intensity at which the estimated time of concentration (T_c) achieves 80% capture efficiency, I_1	I_1=	0.26	in/hr
3	Enter the effect depth of provided HSCs upstream, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
4	Enter capture efficiency corresponding to d_{HSC}, Y_2 (Worksheet A)	Y_2=	0	%
5	Using Figure III.4, determine the design intensity at which the time of concentration (T_c) achieves the upstream capture efficiency(Y_2), I_2	I_2=	0	in/hr
6	Determine the design intensity that must be provided by BMP, $I_{design}= I_1-I_2$	I_{design}=	0.26	in/hr
Step 2: Calculate the design flowrate				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	2.018	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9 *	
3	Calculate runoff coefficient, $C= (0.75 \times imp) + 0.15$	C=	0.83	
4	Calculate design flowrate, $Q_{design}= (C \times i_{design} \times A)$	Q_{design}=	0.433	cfs

Supporting Calculations

Describe system:
Surface runoff will be conveyed through the private street to proposed curb inlet Biofiltration Vaults for water quality treatment.

*Assumed 90% impervious coverage utilized for preliminary calculations. Actual impervious coverage will be calculated in final engineering.

Provide time of concentration assumptions:
The time of concentration was assumed to be 5 minutes for conservative purposes.

Worksheet D: Capture Efficiency Method for Flow-Based BMPs

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter the time of concentration, T_c (min) (See Appendix IV.2)	T_c=	5.00	
2	Using Figure III.4, determine the design intensity at which the estimated time of concentration (T_c) achieves 80% capture efficiency, I_1	I_1=	0.26	in/hr
3	Enter the effect depth of provided HSCs upstream, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
4	Enter capture efficiency corresponding to d_{HSC}, Y_2 (Worksheet A)	Y_2=	0	%
5	Using Figure III.4, determine the design intensity at which the time of concentration (T_c) achieves the upstream capture efficiency(Y_2), I_2	I_2=	0	in/hr
6	Determine the design intensity that must be provided by BMP, $I_{design} = I_1 - I_2$	I_{design}=	0.26	in/hr
Step 2: Calculate the design flowrate				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	2.144	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9 *	
3	Calculate runoff coefficient, $C = (0.75 \times imp) + 0.15$	C=	0.83	
4	Calculate design flowrate, $Q_{design} = (C \times i_{design} \times A)$	Q_{design}=	0.460	cfs

Supporting Calculations

Describe system:
Surface runoff will be conveyed through the private street to proposed curb inlet Biofiltration Vaults for water quality treatment.

*Assumed 90% impervious coverage utilized for preliminary calculations. Actual impervious coverage will be calculated in final engineering.

Provide time of concentration assumptions:
The time of concentration was assumed to be 5 minutes for conservative purposes.

Worksheet D: Capture Efficiency Method for Flow-Based BMPs

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter the time of concentration, T_c (min) (See Appendix IV.2)	T_c=	5.00	
2	Using Figure III.4, determine the design intensity at which the estimated time of concentration (T_c) achieves 80% capture efficiency, I_1	I_1=	0.26	in/hr
3	Enter the effect depth of provided HSCs upstream, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
4	Enter capture efficiency corresponding to d_{HSC}, Y_2 (Worksheet A)	Y_2=	0	%
5	Using Figure III.4, determine the design intensity at which the time of concentration (T_c) achieves the upstream capture efficiency(Y_2), I_2	I_2=	0	in/hr
6	Determine the design intensity that must be provided by BMP, $I_{design}= I_1-I_2$	I_{design}=	0.26	in/hr
Step 2: Calculate the design flowrate				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	1.935	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9 *	
3	Calculate runoff coefficient, $C= (0.75 \times imp) + 0.15$	C=	0.83	
4	Calculate design flowrate, $Q_{design}= (C \times i_{design} \times A)$	Q_{design}=	0.415	cfs

Supporting Calculations

Describe system:
Surface runoff will be conveyed through the private street to proposed curb inlet Biofiltration Vaults for water quality treatment.

*Assumed 90% impervious coverage utilized for preliminary calculations. Actual impervious coverage will be calculated in final engineering.

Provide time of concentration assumptions:
The time of concentration was assumed to be 5 minutes for conservative purposes.

Worksheet D: Capture Efficiency Method for Flow-Based BMPs

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter the time of concentration, T_c (min) (See Appendix IV.2)	T_c=	5.00	
2	Using Figure III.4, determine the design intensity at which the estimated time of concentration (T_c) achieves 80% capture efficiency, I_1	I_1=	0.26	in/hr
3	Enter the effect depth of provided HSCs upstream, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
4	Enter capture efficiency corresponding to d_{HSC}, Y_2 (Worksheet A)	Y_2=	0	%
5	Using Figure III.4, determine the design intensity at which the time of concentration (T_c) achieves the upstream capture efficiency(Y_2), I_2	I_2=	0	in/hr
6	Determine the design intensity that must be provided by BMP, $I_{design} = I_1 - I_2$	I_{design}=	0.26	in/hr
Step 2: Calculate the design flowrate				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	0.476	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9 *	
3	Calculate runoff coefficient, $C = (0.75 \times imp) + 0.15$	C=	0.83	
4	Calculate design flowrate, $Q_{design} = (C \times i_{design} \times A)$	Q_{design}=	0.102	cfs

Supporting Calculations

Describe system:
Surface runoff will be conveyed through the private street to proposed curb inlet Biofiltration Vaults for water quality treatment.

*Assumed 90% impervious coverage utilized for preliminary calculations. Actual impervious coverage will be calculated in final engineering.

Provide time of concentration assumptions:
The time of concentration was assumed to be 5 minutes for conservative purposes.

Worksheet D: Capture Efficiency Method for Flow-Based BMPs

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter the time of concentration, T_c (min) (See Appendix IV.2)	T_c=	5.00	
2	Using Figure III.4, determine the design intensity at which the estimated time of concentration (T_c) achieves 80% capture efficiency, I_1	I_1=	0.26	in/hr
3	Enter the effect depth of provided HSCs upstream, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
4	Enter capture efficiency corresponding to d_{HSC}, Y_2 (Worksheet A)	Y_2=	0	%
5	Using Figure III.4, determine the design intensity at which the time of concentration (T_c) achieves the upstream capture efficiency(Y_2), I_2	I_2=	0	in/hr
6	Determine the design intensity that must be provided by BMP, $I_{design} = I_1 - I_2$	I_{design}=	0.26	in/hr
Step 2: Calculate the design flowrate				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	0.439	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9 *	
3	Calculate runoff coefficient, $C = (0.75 \times imp) + 0.15$	C=	0.83	
4	Calculate design flowrate, $Q_{design} = (C \times i_{design} \times A)$	Q_{design}=	0.094	cfs

Supporting Calculations

Describe system:
Surface runoff will be conveyed through the private street to proposed curb inlet Biofiltration Vaults for water quality treatment.

*Assumed 90% impervious coverage utilized for preliminary calculations. Actual impervious coverage will be calculated in final engineering.

Provide time of concentration assumptions:
The time of concentration was assumed to be 5 minutes for conservative purposes.

Worksheet D: Capture Efficiency Method for Flow-Based BMPs

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter the time of concentration, T_c (min) (See Appendix IV.2)	T_c=	5.00	
2	Using Figure III.4, determine the design intensity at which the estimated time of concentration (T_c) achieves 80% capture efficiency, I_1	I_1=	0.26	in/hr
3	Enter the effect depth of provided HSCs upstream, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0	inches
4	Enter capture efficiency corresponding to d_{HSC}, Y_2 (Worksheet A)	Y_2=	0	%
5	Using Figure III.4, determine the design intensity at which the time of concentration (T_c) achieves the upstream capture efficiency(Y_2), I_2	I_2=	0	in/hr
6	Determine the design intensity that must be provided by BMP, $I_{design}= I_1-I_2$	I_{design}=	0.26	in/hr
Step 2: Calculate the design flowrate				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	2.246	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.9 *	
3	Calculate runoff coefficient, $C= (0.75 \times imp) + 0.15$	C=	0.83	
4	Calculate design flowrate, $Q_{design}= (C \times i_{design} \times A)$	Q_{design}=	0.482	cfs

Supporting Calculations

Describe system:
Surface runoff will be conveyed through the private street to proposed curb inlet Biofiltration Vaults for water quality treatment.

*Assumed 90% impervious coverage utilized for preliminary calculations. Actual impervious coverage will be calculated in final engineering.

Provide time of concentration assumptions:
The time of concentration was assumed to be 5 minutes for conservative purposes.

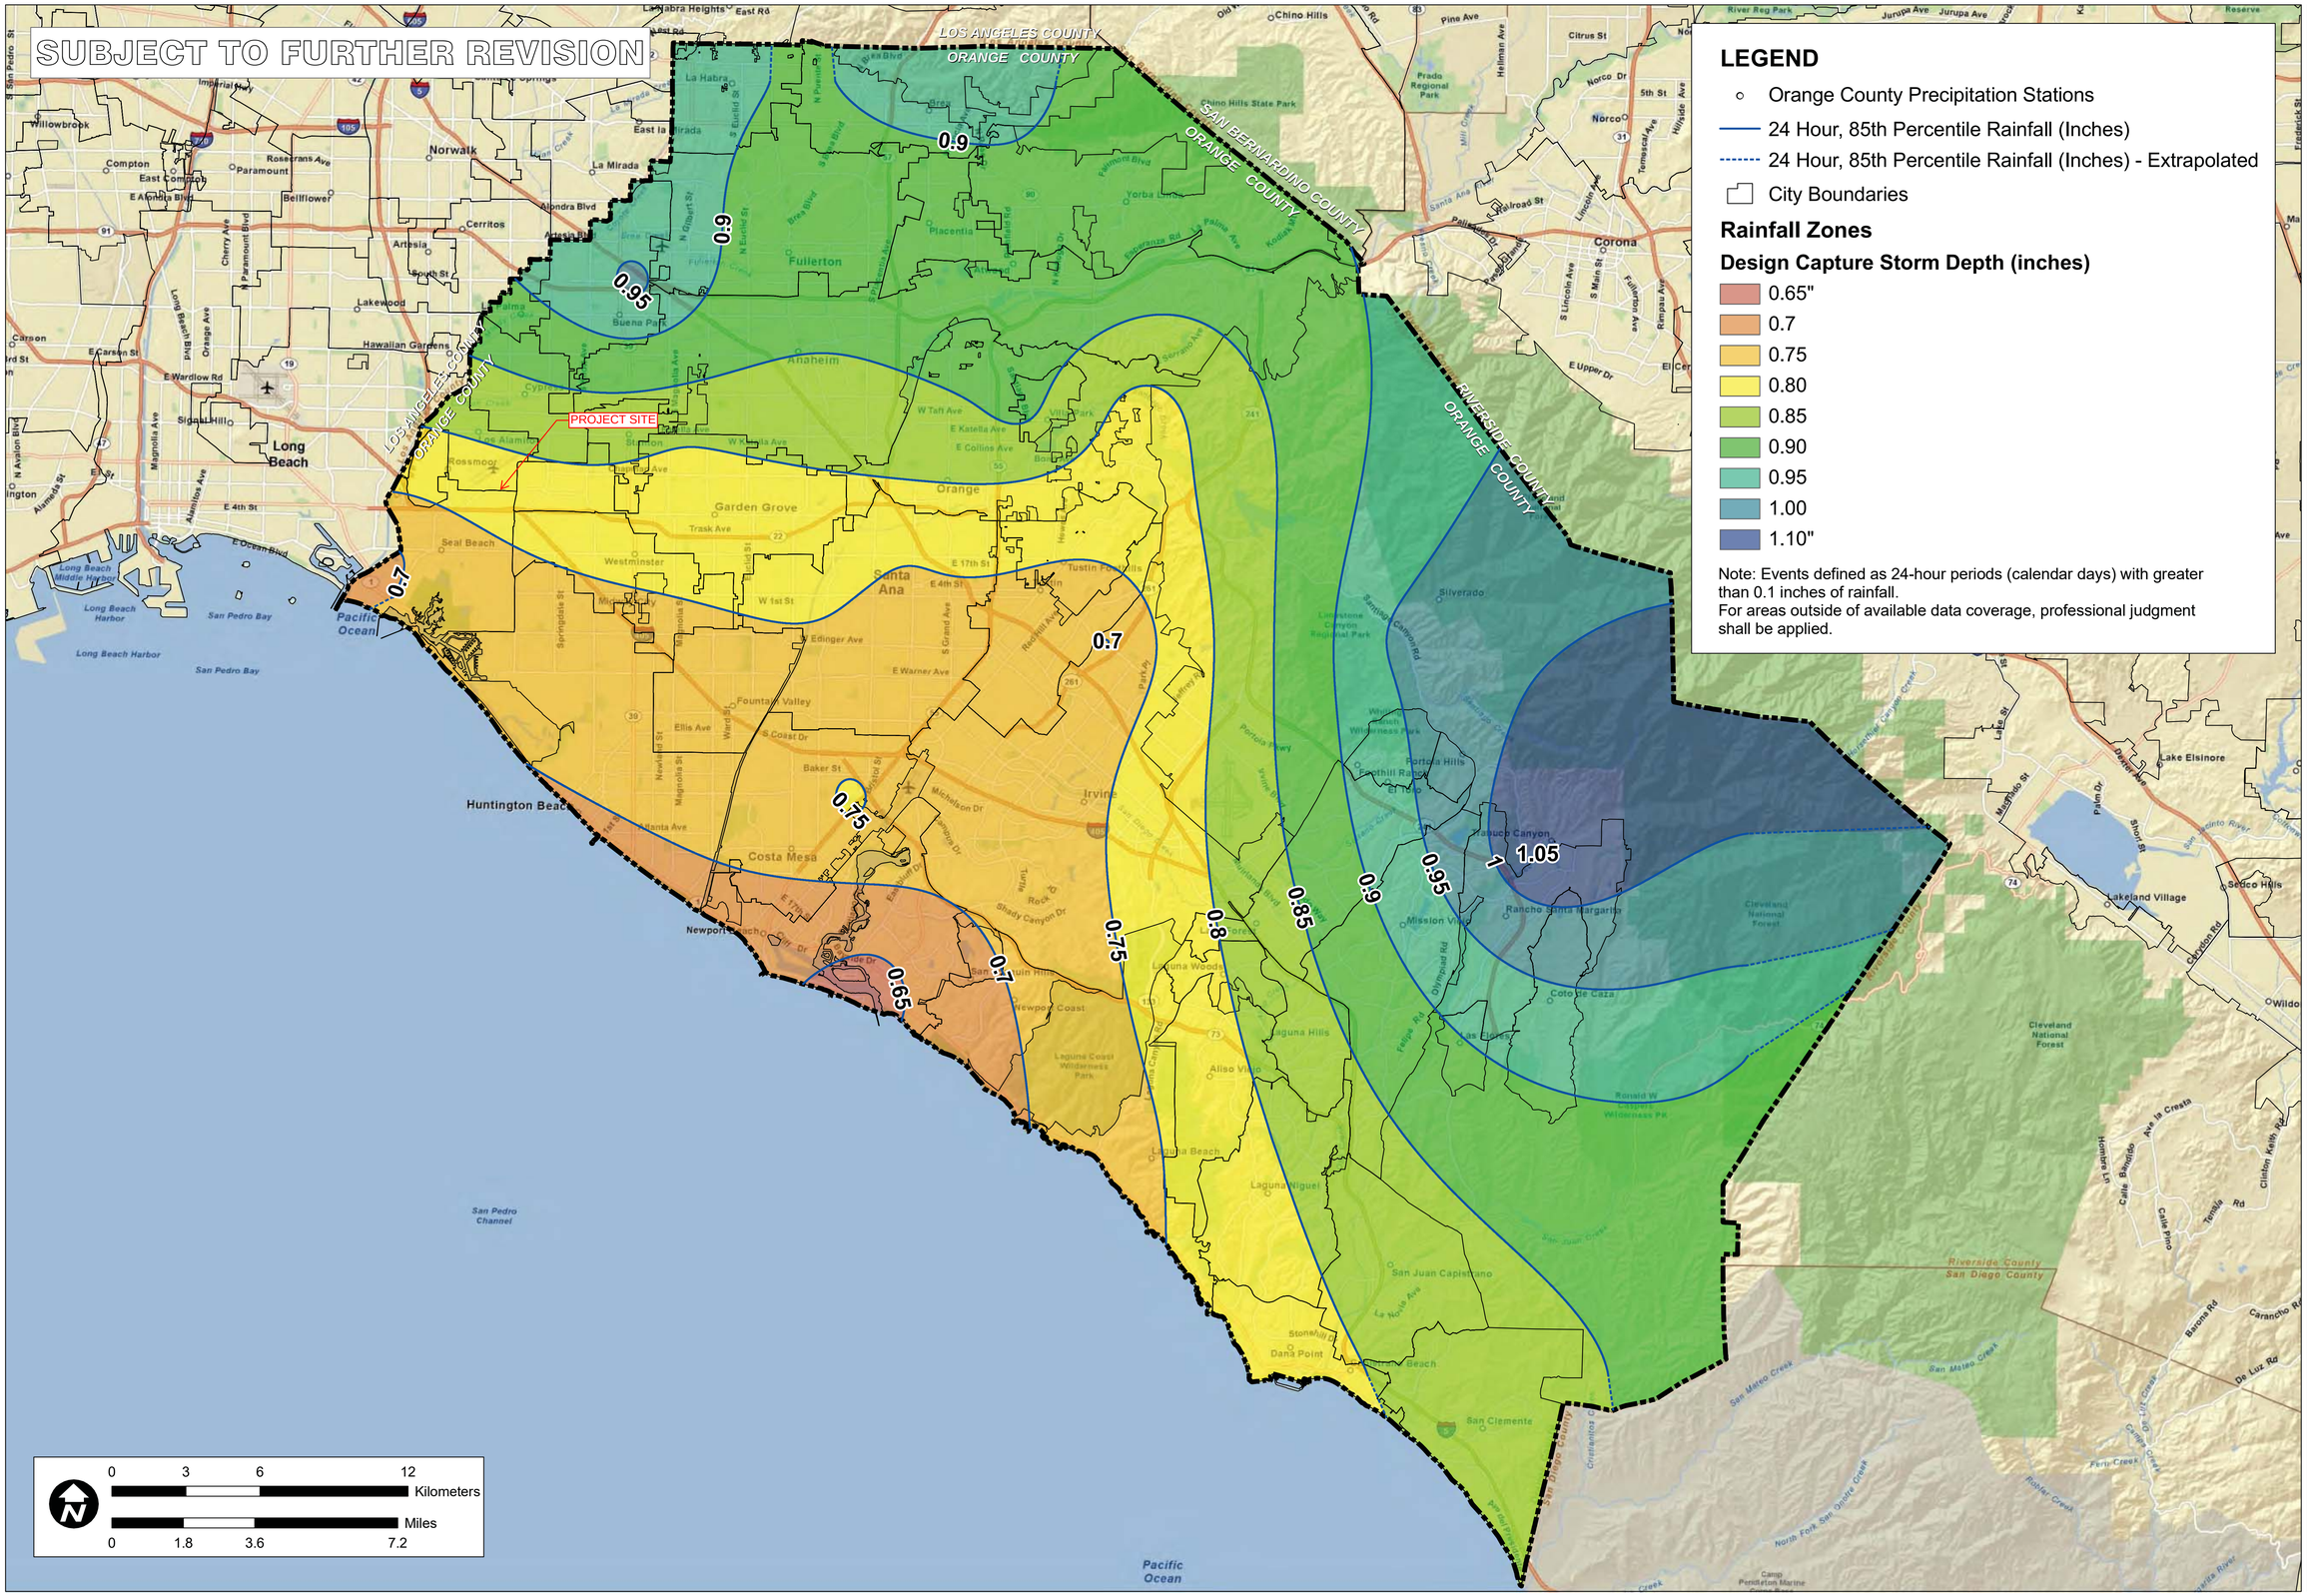
Worksheet I: Summary of Groundwater-related Feasibility Criteria

1	Is project large or small? (as defined by Table VIII.2) circle one	**Large**		Small
2	What is the tributary area to the BMP?	A	12.12	acres
3	What type of BMP is proposed?	Underground infiltration		
4	What is the infiltrating surface area of the proposed BMP?	A_{BMP}		sq-ft
5	What land use activities are present in the tributary area (list all) Multi-Family Residential			
6	What land use-based risk category is applicable?	L	**M**	H
7	If M or H, what pretreatment and source isolation BMPs have been considered and are proposed (describe all): Proposed MWS System Biofiltration Vaults will provide treatment for the required design flow rate.			
8	What minimum separation to mounded seasonally high groundwater applies to the proposed BMP? See Section VIII.2 (circle one)	**5 ft**		10 ft
9	Provide rationale for selection of applicable minimum separation to seasonally high mounded groundwater: Per the TGD Section VIII.2, the following applies to a subsurface infiltration gallery: "Separation to mounded seasonally high groundwater shall be at least 10 feet for infiltration devices that inject water below the subsurface and surface infiltration BMPs with tributary area and land use activities that are considered to pose a more significant risk to groundwater quality."			
10	What is separation from the infiltrating surface to seasonally high groundwater?	SHGWT	<10	ft
11	What is separation from the infiltrating surface to mounded seasonally high groundwater?	Mounded SHGWT	n/a	ft
12	Describe assumptions and methods used for mounding analysis: Groundwater was encountered at 11-13 feet below existing grade			
13	Is the site within a plume protection boundary (See Figure VIII.2)?	Y	**N**	N/A
14	Is the site within a selenium source area or other natural plume area (See Figure VIII.2)?	Y	**N**	N/A
15	Is the site within 250 feet of a contaminated site?	Y	**N**	N/A

Worksheet I: Summary of Groundwater-related Feasibility Criteria

16	If site-specific study has been prepared, provide citation and briefly summarize relevant findings: n/a	
17	Is the site within 100 feet of a water supply well, spring, septic system?	Y **N** N/A
18	Is infiltration feasible on the site relative to groundwater-related criteria?	Y **N**
Provide rationale for feasibility determination: Per the preliminary Geotechnical Evaluation and Design Recommendations Report prepared by LGC Geotechnical, Inc dated December 21, 2021: "Geotechnical stability and integrity of the project site is reliant upon appropriate handling of surface water. Due to the extremely low measured infiltration rate, low permeability fine-grained soils at depth, shallow groundwater and site liquefaction potential, we strongly recommend against the intentional infiltration of storm water into subsurface soils."		

Note: if a single criterion or group of criteria would render infiltration infeasible, it is not necessary to evaluate every question in this worksheet.



Worksheet J: Summary of Harvested Water Demand and Feasibility **Entire Site**

1	What demands for harvested water exist in the tributary area (check all that apply):			
2	Toilet and urinal flushing		□	
3	Landscape irrigation		✓	
4	Other:_____		□	
5	What is the design capture storm depth? (Figure III.1)	d	0.8	inches
6	What is the project size?	A	12.12	ac
7	What is the acreage of impervious area?	* IA	10.91	ac
	For projects with multiple types of demand (toilet flushing, irrigation demand, and/or other demand)			
8	What is the minimum use required for partial capture? (Table X.6)			gpd
9	What is the project estimated wet season total daily use (Section X.2)?			gpd
10	Is partial capture potentially feasible? (Line 9 > Line 8?)			
	For projects with only toilet flushing demand			
11	What is the minimum TUTIA for partial capture? (Table X.7)			
12	What is the project estimated TUTIA?			
13	Is partial capture potentially feasible? (Line 12 > Line 11?)			
	For projects with only irrigation demand			
14	What is the minimum irrigation area required based on conservation landscape design? (Table X.8) [**10.91x0.9**]	9.82		ac
15	What is the proposed project irrigated area? (multiply conservation landscaping by 1; multiply active turf by 2)	0.9		ac
16	Is partial capture potentially feasible? (Line 15 > Line 14?)	No		

Provide supporting assumptions and citations for controlling demand calculation:
Due to the proposed development type, density and amount of available landscaping, Harvest and Use BMPs for irrigation purposes will not be feasible.

* For preliminary purposes, an assumed 90% impervious coverage based on development type was utilized for these calculations.

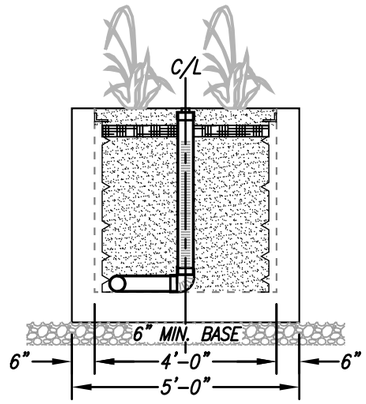
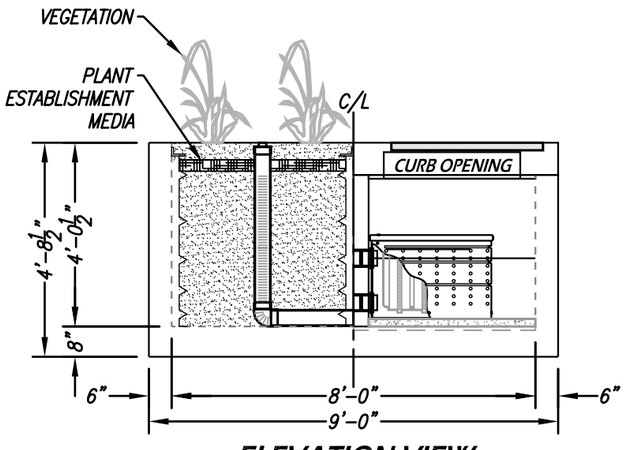
INSTALLATION NOTES



1. CONTRACTOR TO PROVIDE ALL LABOR, EQUIPMENT, MATERIALS AND INCIDENTALS REQUIRED TO OFFLOAD AND INSTALL THE SYSTEM AND APPURTENANCES IN ACCORDANCE WITH THIS DRAWING AND THE MANUFACTURERS SPECIFICATIONS, UNLESS OTHERWISE STATED IN MANUFACTURERS CONTRACT.
2. UNIT MUST BE INSTALLED ON LEVEL BASE. MANUFACTURER RECOMMENDS A MINIMUM 6" LEVEL ROCK BASE UNLESS SPECIFIED BY THE PROJECT ENGINEER. CONTRACTOR IS RESPONSIBLE TO VERIFY PROJECT ENGINEERS RECOMMENDED BASE SPECIFICATIONS.
3. ALL PIPES MUST BE FLUSH WITH INSIDE SURFACE OF CONCRETE. (PIPES CANNOT INTRUDE BEYOND FLUSH). INVERT OF OUTFLOW PIPE MUST BE FLUSH WITH DISCHARGE CHAMBER FLOOR. ALL GAPS AROUND PIPES SHALL BE SEALED WATER TIGHT WITH A NON–SHRINK GROUT PER MANUFACTURERS STANDARD CONNECTION DETAIL AND SHALL MEET OR EXCEED REGIONAL PIPE CONNECTION STANDARDS.
4. CONTRACTOR TO SUPPLY AND INSTALL ALL EXTERNAL CONNECTING PIPES.
5. CONTRACTOR RESPONSIBLE FOR INSTALLATION OF ALL RISERS, MANHOLES, AND HATCHES. CONTRACTOR TO GROUT ALL MANHOLES AND HATCHES TO MATCH FINISHED SURFACE UNLESS SPECIFIED OTHERWISE.
6. DRIP OR SPRAY IRRIGATION REQUIRED ON ALL UNITS WITH VEGETATION.

GENERAL NOTES



1. MANUFACTURER TO PROVIDE ALL MATERIALS UNLESS OTHERWISE NOTED.
2. ALL DIMENSIONS, ELEVATIONS, SPECIFICATIONS AND CAPACITIES ARE SUBJECT TO CHANGE. FOR PROJECT SPECIFIC DRAWINGS DETAILING EXACT DIMENSIONS, WEIGHTS AND ACCESSORIES PLEASE CONTACT MANUFACTURER.

The Urban Impact

For hundreds of years natural wetlands surrounding our shores have played an integral role as nature's stormwater treatment system. But as our cities grow and develop, these natural wetlands have perished under countless roads, rooftops, and parking lots.

Plant A Wetland

Without natural wetlands our cities are deprived of water purification, flood control, and land stability. Modular Wetlands and the MWS Linear re-establish nature's presence and rejuvenate water ways in urban areas.

MWS Linear

The Modular Wetland System Linear represents a pioneering breakthrough in stormwater technology as the only biofiltration system to utilize patented horizontal flow, allowing for a smaller footprint and higher treatment capacity. While most biofilters use little or no pre-treatment, the MWS Linear incorporates an advanced pre-treatment chamber that includes separation and pre-filter cartridges. In this chamber sediment and hydrocarbons are removed from runoff before it enters the biofiltration chamber, in turn reducing maintenance costs and improving performance.

Applications

The MWS Linear has been successfully used on numerous new construction and retrofit projects. The system's superior versatility makes it beneficial for a wide range of stormwater and waste water applications - treating rooftops, streetscapes, parking lots, and industrial sites.

Industrial

Many states enforce strict regulations for discharges from industrial sites. The MWS Linear has helped various sites meet difficult EPA mandated effluent limits for dissolved metals and other pollutants.

Residential

Low to high density developments can benefit from the versatile design of the MWS Linear. The system can be used in both decentralized LID design and cost-effective end-of-the-line configurations.

Streets

Street applications can be challenging due to limited space. The MWS Linear is very adaptable, and offers the smallest footprint to work around the constraints of existing utilities on retrofit projects.

Parking Lots

Parking lots are designed to maximize space and the MWS Linear's 4 ft. standard planter width allows for easy integration into parking lot islands and other landscape medians.

Commercial

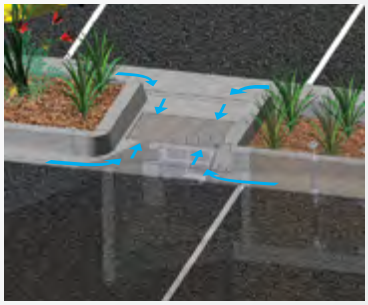
Compared to bioretention systems, the MWS Linear can treat far more area in less space - meeting treatment and volume control requirements.

Mixed Use

The MWS Linear can be installed as a raised planter to treat runoff from rooftops or patios, making it perfect for sustainable "live-work" spaces.

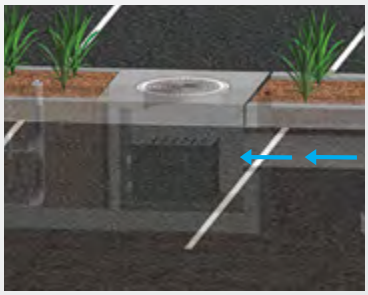
More applications are available on our website: www.ModularWetlands.com/Applications

- Agriculture
- Reuse
- Low Impact Development
- Waste Water



Configurations

The MWS Linear is the preferred biofiltration system of Civil Engineers across the country due to its versatile design. This highly versatile system has available "pipe-in" options on most models, along with built-in curb or grated inlets for simple integration into your stormdrain design.



Curb Type

The *Curb Type* configuration accepts sheet flow through a curb opening and is commonly used along road ways and parking lots. It can be used in sump or flow by conditions. Length of curb opening varies based on model and size.

Grate Type

The *Grate Type* configuration offers the same features and benefits as the *Curb Type* but with a grated/drop inlet above the systems pre-treatment chamber. It has the added benefit of allowing for pedestrian access over the inlet. ADA compliant grates are available to assure easy and safe access. The *Grate Type* can also be used in scenarios where runoff needs to be intercepted on both sides of landscape islands.

Vault Type

The system's patented horizontal flow biofilter is able to accept inflow pipes directly into the pre-treatment chamber, meaning the MWS Linear can be used in end-of-the-line installations. This greatly improves feasibility over typical decentralized designs that are required with other biofiltration/bioretention systems. Another benefit of the "pipe in" design is the ability to install the system downstream of underground detention systems to meet water quality volume requirements.

Downspout Type

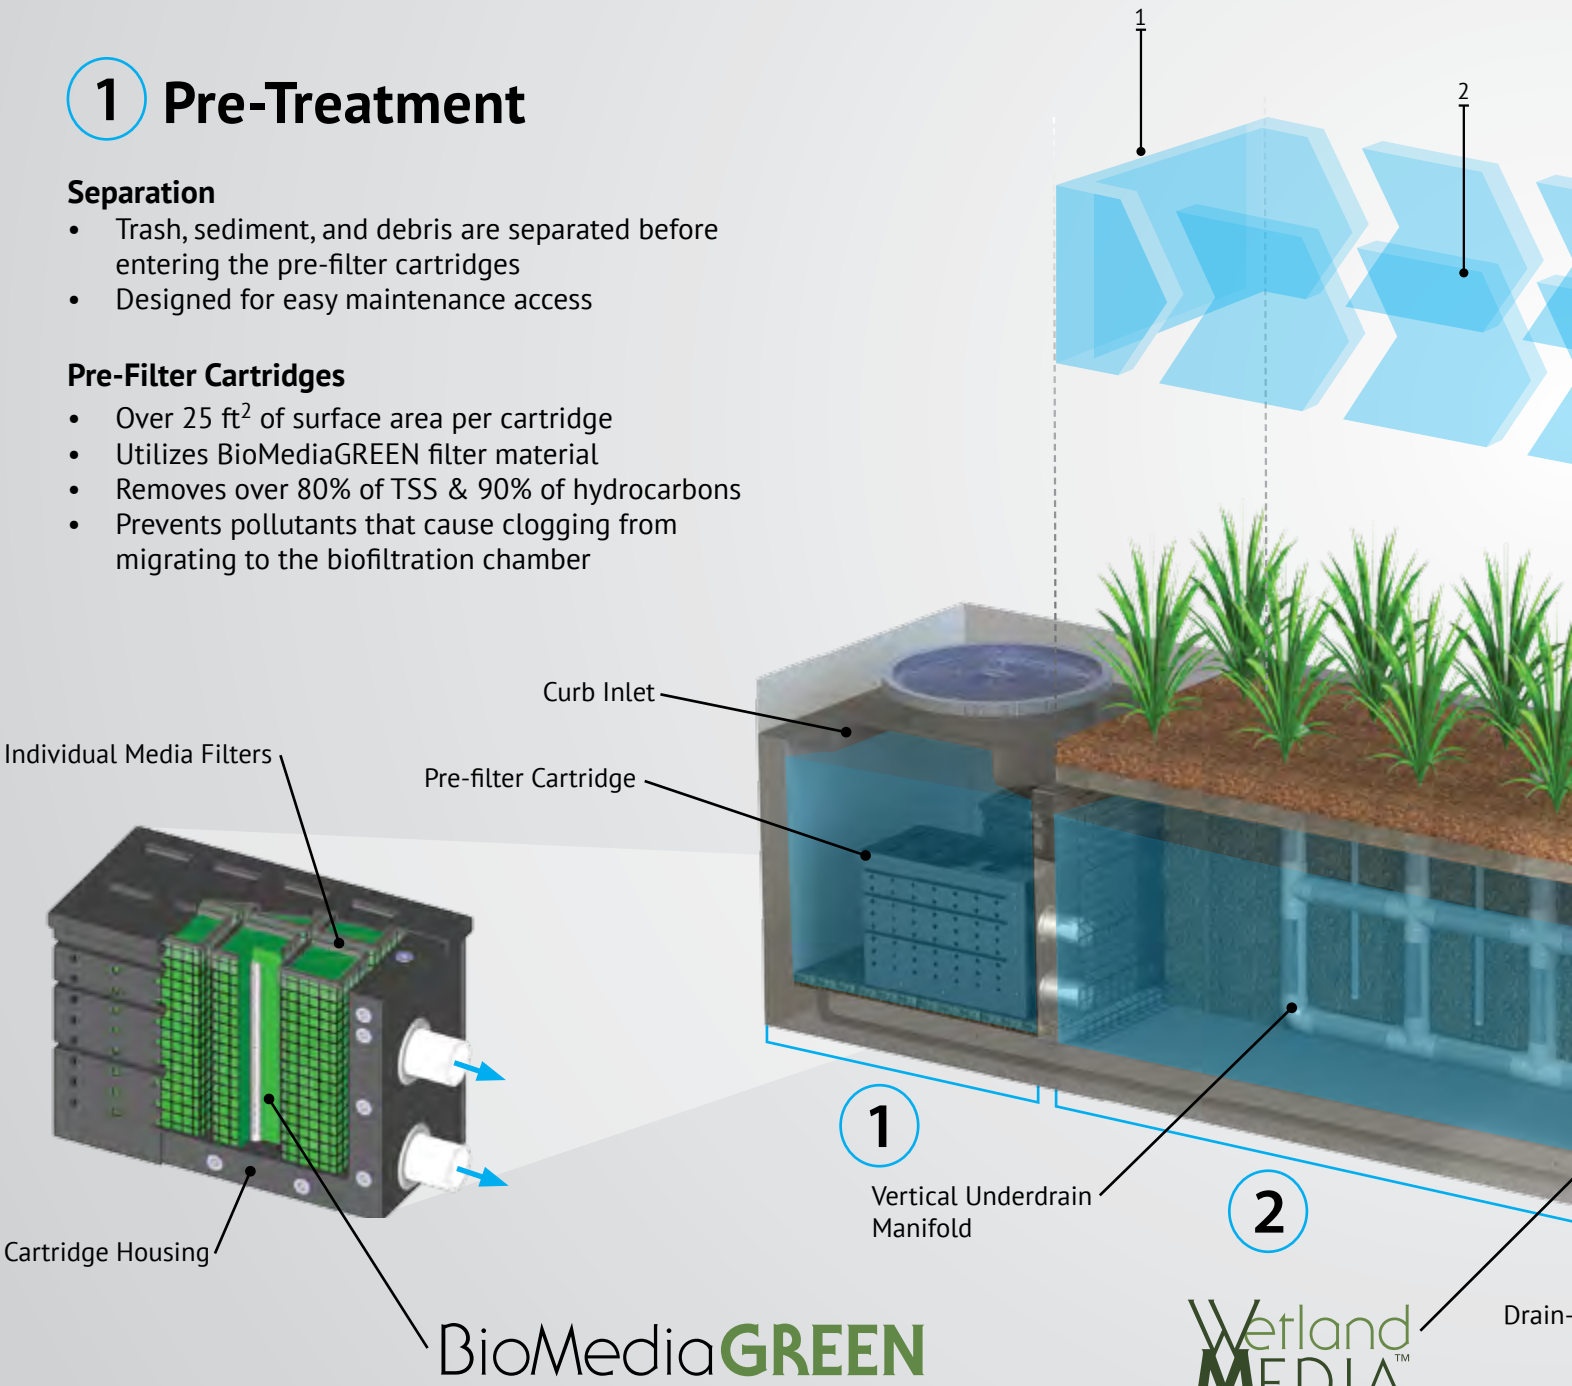
The *Downspout Type* is a variation of the *Vault Type* and is designed to accept a vertical downspout pipe from roof top and podium areas. Some models have the option of utilizing an internal bypass, simplifying the overall design. The system can be installed as a raised planter and the exterior can be stuccoed or covered with other finishes to match the look of adjacent buildings.

Advantages & Operation

The MWS Linear is the most efficient and versatile biofiltration system on the market, and the only system with horizontal flow which improves performance, reduces footprint, and minimizes maintenance. Figure-1 and Figure-2 illustrate the invaluable benefits of horizontal flow and the multiple treatment stages.

Featured Advantages

- Horizontal Flow Biofiltration
- Greater Filter Surface Area
- Pre-Treatment Chamber
- Patented Perimeter Void Area
- Flow Control
- No Depressed Planter Area



1 Pre-Treatment

Separation

- Trash, sediment, and debris are separated before entering the pre-filter cartridges
- Designed for easy maintenance access

Pre-Filter Cartridges

- Over 25 ft^2 of surface area per cartridge
- Utilizes BioMediaGREEN filter material
- Removes over 80% of TSS & 90% of hydrocarbons
- Prevents pollutants that cause clogging from migrating to the biofiltration chamber

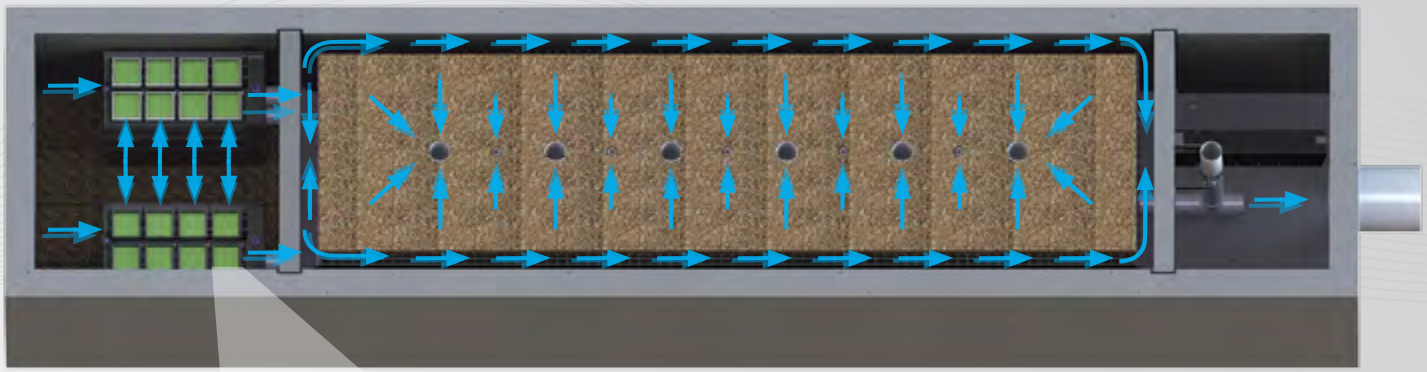


Fig. 2 - Top View

2x to 3x More Surface Area Than Traditional Downward Flow Bioretention Systems.

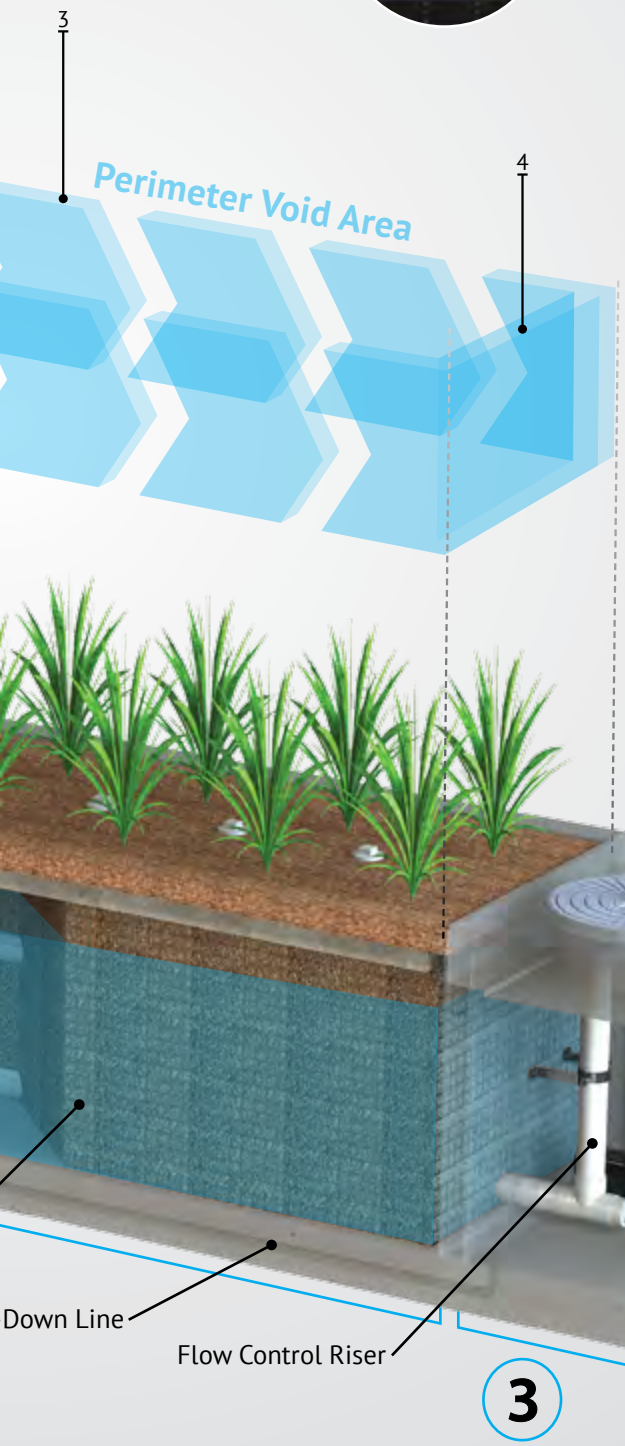

Fig. 1

2 Biofiltration

Horizontal Flow

- Less clogging than downward flow biofilters
- Water flow is subsurface
- Improves biological filtration

Patented Perimeter Void Area

- Vertically extends void area between the walls and the WetlandMEDIA on all four sides.
- Maximizes surface area of the media for higher treatment capacity

WetlandMEDIA

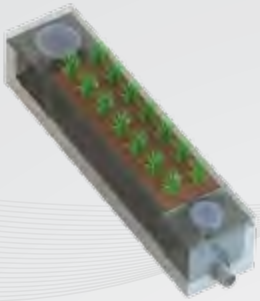
- Contains no organics and removes phosphorus
- Greater surface area and 48% void space
- Maximum evapotranspiration
- High ion exchange capacity and light weight

3 Discharge

Flow Control

- Orifice plate controls flow of water through WetlandMEDIA to a level lower than the media's capacity.
- Extends the life of the media and improves performance

Drain-Down Filter



- The Drain-Down is an optional feature that completely drains the pre-treatment chamber
- Water that drains from the pre-treatment chamber between storm events will be treated

Orientations

Side-By-Side

The *Side-By-Side* orientation places the pre-treatment and discharge chamber adjacent to one another with the biofiltration chamber running parallel on either side. This minimizes the system length, providing a highly compact footprint. It has been proven useful in situations such as streets with directly adjacent sidewalks, as half of the system can be placed under that sidewalk. This orientation also offers internal bypass options as discussed below.

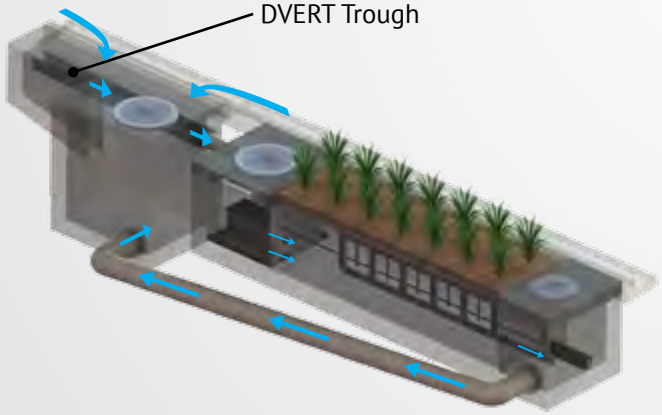
End-To-End

The *End-To-End* orientation places the pre-treatment and discharge chambers on opposite ends of the biofiltration chamber therefore minimizing the width of the system to 5 ft (outside dimension). This orientation is perfect for linear projects and street retrofits where existing utilities and sidewalks limit the amount of space available for installation. One limitation of this orientation is bypass must be external.

Bypass

Internal Bypass Weir (Side-by-Side Only)

The *Side-By-Side* orientation places the pre-treatment and discharge chambers adjacent to one another allowing for integration of internal bypass. The wall between these chambers can act as a bypass weir when flows exceed the system's treatment capacity, thus allowing bypass from the pre-treatment chamber directly to the discharge chamber.



External Diversion Weir Structure

This traditional offline diversion method can be used with the MWS Linear in scenarios where runoff is being piped to the system. These simple and effective structures are generally configured with two outflow pipes. The first is a smaller pipe on the upstream side of the diversion weir - to divert low flows over to the MWS Linear for treatment. The second is the main pipe that receives water once the system has exceeded treatment capacity and water flows over the weir.

Flow By Design

This method is one in which the system is placed just upstream of a standard curb or grate inlet to intercept the first flush. Higher flows simply pass by the MWS Linear and into the standard inlet downstream.

DVERT Low Flow Diversion

This simple yet innovative diversion trough can be installed in existing or new curb and grate inlets to divert the first flush to the MWS Linear via pipe. It works similar to a rain gutter and is installed just below the opening into the inlet. It captures the low flows and channels them over to a connecting pipe exiting out the wall of the inlet and leading to the MWS Linear. The DVERT is perfect for retrofit and green street applications that allows the MWS Linear to be installed anywhere space is available.

Performance

The MWS Linear continues to outperform other treatment methods with superior pollutant removal for TSS, heavy metals, nutrients, hydrocarbons and bacteria. Since 2007 the MWS Linear has been field tested on numerous sites across the country. With it's advanced pre-treatment chamber and innovative horizontal flow biofilter, the system is able to effectively remove pollutants through a combination of physical, chemical, and biological filtration processes. With the same biological processes found in natural wetlands, the MWS Linear harnesses natures ability to process, transform, and remove even the most harmful pollutants.

Approvals

The MWS Linear has successfully met years of challenging technical reviews and testing from some of the most prestigious and demanding agencies in the nation, and perhaps the world.

Washington State DOE Approved

The MWS Linear is approved for General Use Level Designation (GULD) for Basic, Enhanced, and Phosphorus treatment at 1 gpm/ft^2 loading rate. The highest performing BMP on the market for all main pollutant categories.

TSS	Total Phosphorus	Ortho Phosphorus	Nitrogen	Dissolved Zinc	Dissolved Copper	Total Zinc	Total Copper	Motor Oil
85%	64%	67%	45%	66%	38%	69%	50%	95%

DEQ Assignment

The Virginia Department of Environmental Quality assigned the MWS Linear, the highest phosphorus removal rating for manufactured treatment devices to meet the new Virginia Stormwater Management Program (VSMP) Technical Criteria.

MASTEP Evaluation

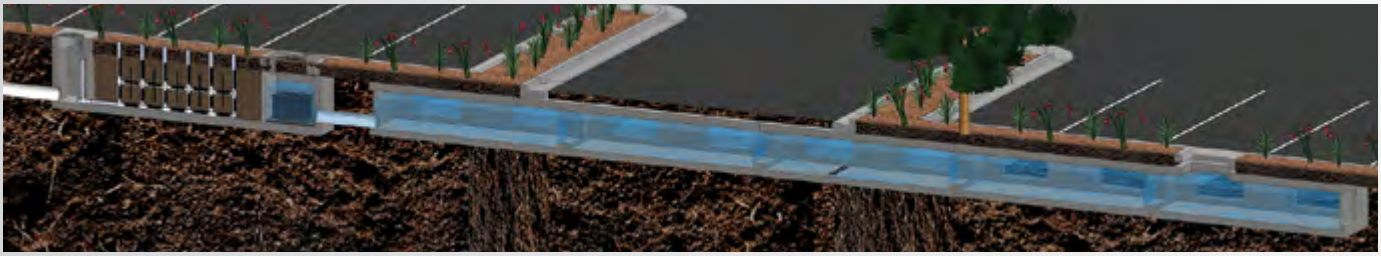
The University of Massachusetts at Amherst – Water Resources Research Center, issued a technical evaluation report noting removal rates up to 84% TSS, 70% Total Phosphorus, 68.5% Total Zinc, and more.

Rhode Island DEM Approved

Approved as an authorized BMP and noted to achieve the following minimum removal efficiencies: 85% TSS, 60% Pathogens, 30% Total Phosphorus for discharges to freshwater systems, and 30% Total Nitrogen for discharges to saltwater or tidal systems.

Flow Based Sizing

The MWS Linear can be used in stand alone applications to meet treatment flow requirements. Since the MWS Linear is the only biofiltration system that can accept inflow pipes several feet below the surface it can be used not only in decentralized design applications but also as a large central end-of-the-line application for maximum feasibility.



Treatment Flow Sizing Table

Model #	Dimensions	WetlandMedia Surface Area	Treatment Flow Rate (cfs)
MWS-L-4-4	4' x 4'	23 ft^2	0.052
MWS-L-4-6	4' x 6'	32 ft^2	0.073
MWS-L-4-8	4' x 8'	50 ft^2	0.115
MWS-L-4-13	4' x 13'	63 ft^2	0.144
MWS-L-4-15	4' x 15'	76 ft^2	0.175
MWS-L-4-17	4' x 17'	90 ft^2	0.206
MWS-L-4-19	4' x 19'	103 ft^2	0.237
MWS-L-4-21	4' x 21'	117 ft^2	0.268
MWS-L-8-8	8' x 8'	100 ft^2	0.230
MWS-L-8-12	8' x 12'	151 ft^2	0.346
MWS-L-8-16	8' x 16'	201 ft^2	0.462

Volume Based Sizing

Many states require treatment of a water quality volume and do not offer the option of flow based design. The MWS Linear and its unique horizontal flow makes it the only biofilter that can be used in volume based design installed downstream of ponds, detention basins, and underground storage systems.

Treatment Volume Sizing Table

Model #	Treatment Capacity (cu. ft.) @ 24-Hour Drain Down	Treatment Capacity (cu. ft.) @ 48-Hour Drain Down
MWS-L-4-4	1140	2280
MWS-L-4-6	1600	3200
MWS-L-4-8	2518	5036
MWS-L-4-13	3131	6261
MWS-L-4-15	3811	7623
MWS-L-4-17	4492	8984
MWS-L-4-19	5172	10345
MWS-L-4-21	5853	11706
MWS-L-8-8	5036	10072
MWS-L-8-12	7554	15109
MWS-L-8-16	10073	20145

Installation

The MWS Linear is simple, easy to install, and has a space efficient design that offers lower excavation and installation costs compared to traditional tree-box type systems. The structure of the system resembles pre-cast catch basin or utility vaults and is installed in a similar fashion.

The system is delivered fully assembled for quick installation. Generally, the structure can be unloaded and set in place in 15 minutes. Our experienced team of field technicians are available to supervise installations and provide technical support.

Maintenance

Reduce your maintenance costs, man hours, and materials with the MWS Linear. Unlike other biofiltration systems that provide no pre-treatment, the MWS Linear is a self-contained treatment train which incorporates simple and effective pre-treatment.

Maintenance requirements for the biofilter itself are almost completely eliminated, as the pre-treatment chamber removes and isolates trash, sediments, and hydrocarbons. What's left is the simple maintenance of an easily accessible pre-treatment chamber that can be cleaned by hand or with a standard vac truck. Only periodic replacement of low-cost media in the pre-filter cartridges is required for long term operation and there is absolutely no need to replace expensive biofiltration media.

Plant Selection

Abundant plants, trees, and grasses bring value and an aesthetic benefit to any urban setting, but those in the MWS Linear do even more - they increase pollutant removal. What's not seen, but very important, is that below grade the stormwater runoff/flow is being subjected to nature's secret weapon: a dynamic physical, chemical, and biological process working to break down and remove non-point source pollutants. The flow rate is controlled in the MWS Linear, giving the plants more "contact time" so that pollutants are more successfully decomposed, volatilized and incorporated into the biomass of The MWS Linear's micro/macro flora and fauna.

A wide range of plants are suitable for use in the MWS Linear, but selections vary by location and climate. View suitable plants by selecting the list relative to your project location's hardy zone.

Please visit www.ModularWetlands.com/Plants for more information and various plant lists.

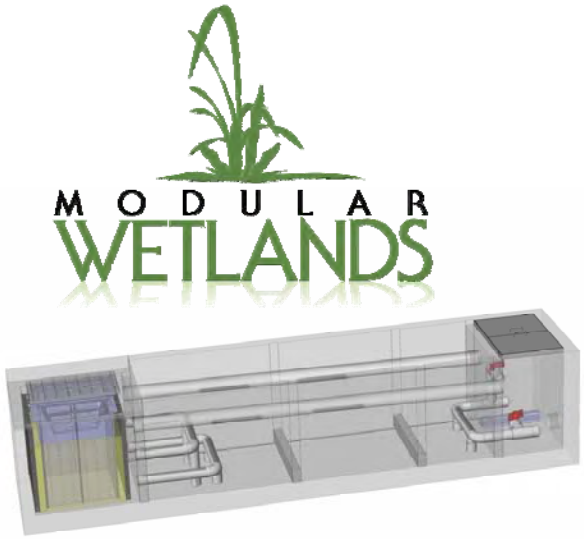
MWS – Linear



Hybrid Stormwater Filtration System

Save valuable space with small footprint for urban sites.

Improve BMP aesthetics with attractive native and tropical landscape plants.

Reduce lifetime costs with safer and less expensive maintenance

"The MWS – Linear hybrid stormwater treatment system is described as a self contained treatment train. This system utilizes an innovative combination of l treatment processes. Stormwater runoff flows into the system via pipe or curb/grate type catch basin opening. Polluted runoff first encounters a screening device to remove larger pollutants and then enters a hydrodynamic separation chamber which settles out the sediments and larger suspended solids. Next the runoff is treated by a revolutionary filter media, BioMediaGREEN that removes fines and associated pollutants, including bacteria. From there runoff enters of bioretention filter in the form of a subsurface flow vegetated gravel wetland. Within the wetland physical, chemical, and biological mechanisms remove the remaining particulate and dissolved pollutants. The purified runoff leaves the system via the discharge chamber. In the discharge chamber the rate of discharge is controlled by valves set to a desired rate".

Tested Pollutant Removal Efficiencies:

TSS Removal	Dissolved Lead Removal	Dissolved Copper Removal	TPH	E. coli Removal	Turbidity Removal
98%	81%	92%	99%	60.2%	92%

"Nature and Harmony Working Together in Perfect Harmony"

SPECIFICATIONS – MWS- LINEAR

Track Record: The MWS- Linear Hybrid Stormwater Treatment System is manufactured by a company whom is regularly engaged in the engineering design and production of treatment systems for stormwater.

Coverage: The MWS- Linear is designed to treat the water quality volume or water quality flow. For flow based design, high flow bypass is internal, for volume based design, high flow bypass is external and prior to pre-detention system. For offline volume based designs the MWS - Linear has the ability to treat the entire water quality volume when used with pre-storage and properly sized.

Non-Corrosive Materials: The MWS – Linear is designed with non-corrosive materials. All internal piping is SD35 PVC. Catch basin filter components, including mounting hardware, fasteners, support brackets, filtration material, and support frame are constructed of non-corrosive materials (316 stainless steel, and UV protected/marine grade fiberglass). Fasteners are stainless steel. Primary filter mesh is 316 stainless steel welded screens. Filtration basket screens for coarse, medium and fine filtration is ¾" x 1 ¾"expanded, 10 x 10 mesh, and 35 x 35 mesh, respectively. No polypropylene, monofilament netting or fabrics shall be used in this system. Media Protective Panels are constructed of UV protected/marine grade fiberglass. Mounts are constructed of stainless steel. BioMediaGREEN is an inert rock substrate and is non-corrosive. Perimeter filter structure is constructed of lightweight injection molded plastic. Mounting brackets are constructed of SD40 PVC and are mounted with 3/8" diameter stainless steel redheads. Drain down filter cover is constructed of UV protected/marine grade fiberglass and stainless steel hinge and mount.

Weight: Each complete unit weighs approximately 29,000 to 40,000 pounds and requires a boom crane to install. Details of this are provided in the installation section of the MWS-Linear Design Kit.

Transportation: The Modular Wetland System – Linear is designed to be transported on a standard flat bed truck. The unit easily fits on a flat bed truck without the need of special permitting.

Alternative Technology Configurations: The Modular Wetland System – Linear is modular is design. Each module will be up to 22 feet long and 5 feet wide. The system can be made in lengths varying from 13 to 100s of feet long. For lengths longer than 22 feet the system will shipped in modules and assembled on site. The Modular Wetland System – Linear has many alternative configurations. This allows the system to be adapted to many site conditions. Runoff can enter the system through a pipe, and/or a built in curb or grate type opening.

Energy Requirements: The Modular Wetland System – Linear is completely passive and requires no external energy sources.

Buoyancy Issues: Buoyancy is only a an issue when ground water levels rise above the bottom of the Modular Wetland System – Linear's concrete structure. With 8.5 cubic yards of wetland media there is no concern of floatation. As a precaution a footing can also be built into the systems concrete structure.

Durability: The structure of the box will be precast concrete. The concrete will be 28 day compressive strength fc = 5,000 psi. Steel reinforcing will be ASTM A – C857. Structure will support an H20 loading as indicted by AASHTO. The joint between the concrete sections will ship lap and joint sealed with ram-nek. Filter (excluding oil absorbent media) and support structures are of proven durability. The filter and mounting structures are of sufficient strength to support water, sediment, and debris loads when the filter is full, with no slippage, breaking, or tearing. All filters are warranted for a minimum of five (5) years.

Oil Absorbent Media: The MWS – Linear utilizes both physical and biological mechanisms to capture and filter oil and grease. A skimmer and boom system will be positioned on the internal perimeter of the catch basin insert. The primary filtration media, BioMediaGreen, utilized in the perimeter and drain down filters, has excellent hydrocarbon removal abilities. Within the wetland filter biological processes capture and

break down oil and grease. Much of the breakdown and transformation of oil and grease is performed by natural occurring bacteria.

Overflow Protection: The grate and curb type MWS – Linear are designed with an internal bypass consisting of two SD PVC pipes which direct high flows around the perimeter and wetland filter, directly into the discharge chamber. For the volume based vault type configuration, bypass should be located prior to the pre-detention system. For peak flows that exceed internal bypass capacity, external bypass is use.

Filter Bypass: Runoff will bypass filtration (BioMediaGREEN and wetland filter) components of the MWS - Linear. The system will still provide screening and settling during higher flow rates for internally bypassed flows. External bypass will bypass of treatment processes.

Pollutant Removal Efficiency: The MWS - Linear is capable of removing over 90% of the net annual total suspended solids (TSS) load based on a 20-micron particle size. Annual TSS removal efficiency models are based on documented removal efficiency performance from full-scale laboratory tests on BioMediaGreen and quarter-scale laboratory tests on the MWS – Linear flow based system.

POLLUTANT	REMOVAL EFFICIENCY
Trash & Litter	99%
TPH (mg/L)	99%
TSS (mg/L)	98%
E. Coli (MPN/100ml)	60%
Turbidity (NTU)	92%
Dissolved Metals (mg/L)	76%

Sil-Co-Sil 106. Mean particle diameter = 19 microns

Non-Scouring: During heavy storm events the runoff bypasses perimeter and wetland filter components. The system will not re-suspend solids at design flows.

Uniqueness: The Modular Wetland System – Linear is a complete self contained treatment train that incorporates capture, screening, sedimentation, filtration, bioretention, high flow bypass, and flow control into a single modular structure. This system provides four stages of treatment making it the only 4 stage treatment train stormwater filtration system, therefore making it unique to the industry. Other systems do not incorporate all the necessary attributes to make it a complete stormwater management device as with the Modular Wetland System – Linear. Therefore, no equal exists for this system.

Pretreatment & Preconditioning: Since the Modular Wetland System – Linear is a complete capture and treatment train stormwater management system no external pretreatment of preconditioning is necessary.

SPECIFICATIONS – BioMediaGREEN

BioMediaGREEN is a proprietary engineered filter media. Made of a unique combination of the inert naturally occurring material this product is non-combustible and do not pose a fire hazard, stable and non-reactive, and is also biodegradable. It is stable with no known adverse environmental effects.

This product has been tested in long-term carcinogenicity studies [inhalation and intraperitoneal injection (i.p.)] with no significant increase in lung tumors or abdominal tumors. Short-term biopersistent (inhalation and intra-tracheal injection) studies have shown that the products disappear very rapidly from the lung.

In October 2001, IARC classified this product as Group 3, "not classifiable as to its carcinogenicity to humans". The 2001 decision was based on the latest epidemiological studies and animal inhalation studies that show no relation between inhalation exposure and the development of tumors.

The product can typically be disposed of in an ordinary landfill (local regulations may apply). If you are unsure of the regulations, contact your local Public Health Department or the local office of the Environmental Protection Agency (EPA).

Coverage: When properly installed BioMediaGREEN Filter Blocks provide sufficient contact time, at rated flows, of passing contaminate water. The BioMediaGREEN material will capture and retain most pollutants that pass through it. The BioMediaGREEN material is made of a proprietary blend of inert substances. The BioMediaGREEN Filter Blocks can be used in different treatment devices, including but not limited to flume filters, trench drain filters, downspout filters, catch basin inserts, water polishing units, and hydrodynamic separators.

Non-Corrosive Materials: The BioMediaGreen material is made of non-corrosive materials.

Durability: The BioMediaGREEN material has been chosen for its proven durability, with an expected life of 2 plus years. The BioMediaGREEN material is of sufficient strength to support water, sediment, and debris loads when the media is at maximum flow; with no slippage, breaking, or tearing. The BioMediaGREEN material has been tested through rigorous flow and loading conditions.

Oil Absorbent Media: The BioMediaGREEN material has been proven to capture and retain hydrocarbons.

Pollutant Removal Efficiency: The BioMediaGREEN Filter Blocks are designed to capture high levels of Hydrocarbons including but not limited to oils & grease, gasoline, diesel, and PAHs. BioMediaGREEN Filter Blocks have the physical ability to block and filter trash and litter, grass and foliage, sediments, TSS, particulate and dissolved metals, nutrients, and bacteria.

BioMediaGREEN technology is based on a proprietary blend of synthetic inert natural substances aimed at removal of various stormwater pollutants. BioMediaGREEN was created to have a very porous structure capable of selectively removing pollutants while

allowing high flow through rates for water. As pollutants are captured by its structure, BioMediaGREEN captures most pollutants and maintains porosity and filtering capabilities.

Field and laboratory tests have confirmed the BioMediaGREEN capability to capture large percentage of TSS, hydrocarbons, nutrients, and heavy metals. Microbial reduction efficiency will vary depending on colony size, flow rates and site specific conditions.

POLLUTANT	REMOVAL EFFICIENCY
Oil & Grease (mg/L)	90%
TPH (mg/L)	99%
TSS (mg/L)	85%
Turbidity (NTU)	99%
Total Phosphorus (mg/L)	69.6%
Dissolved Metals (mg/L)	75.6%

Sil-Co-Sil 106. Mean particle diameter = 19 microns

Replacement: Removal and replacement of the blocks is simple. Remove blocks from filtration system. Replace with new block of equal size.

Site Design & Landscape Planning SD-10

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- ☑ Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Each project site possesses unique topographic, hydrologic, and vegetative features, some of which are more suitable for development than others. Integrating and incorporating appropriate landscape planning methodologies into the project design is the most effective action that can be done to minimize surface and groundwater contamination from stormwater.

Approach

Landscape planning should couple consideration of land suitability for urban uses with consideration of community goals and projected growth. Project plan designs should conserve natural areas to the extent possible, maximize natural water storage and infiltration opportunities, and protect slopes and channels.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment.

Design Considerations

Design requirements for site design and landscapes planning should conform to applicable standards and specifications of agencies with jurisdiction and be consistent with applicable General Plan and Local Area Plan policies.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

Designing New Installations

Begin the development of a plan for the landscape unit with attention to the following general principles:

- Formulate the plan on the basis of clearly articulated community goals. Carefully identify conflicts and choices between retaining and protecting desired resources and community growth.
- Map and assess land suitability for urban uses. Include the following landscape features in the assessment: wooded land, open unwooded land, steep slopes, erosion-prone soils, foundation suitability, soil suitability for waste disposal, aquifers, aquifer recharge areas, wetlands, floodplains, surface waters, agricultural lands, and various categories of urban land use. When appropriate, the assessment can highlight outstanding local or regional resources that the community determines should be protected (e.g., a scenic area, recreational area, threatened species habitat, farmland, fish run). Mapping and assessment should recognize not only these resources but also additional areas needed for their sustenance.

Project plan designs should conserve natural areas to the extent possible, maximize natural water storage and infiltration opportunities, and protect slopes and channels.

Conserve Natural Areas during Landscape Planning

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Cluster development on least-sensitive portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants.
- Promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

Maximize Natural Water Storage and Infiltration Opportunities Within the Landscape Unit

- Promote the conservation of forest cover. Building on land that is already deforested affects basin hydrology to a lesser extent than converting forested land. Loss of forest cover reduces interception storage, detention in the organic forest floor layer, and water losses by evapotranspiration, resulting in large peak runoff increases and either their negative effects or the expense of countering them with structural solutions.
- Maintain natural storage reservoirs and drainage corridors, including depressions, areas of permeable soils, swales, and intermittent streams. Develop and implement policies and

regulations to discourage the clearing, filling, and channelization of these features. Utilize them in drainage networks in preference to pipes, culverts, and engineered ditches.

- Evaluating infiltration opportunities by referring to the stormwater management manual for the jurisdiction and pay particular attention to the selection criteria for avoiding groundwater contamination, poor soils, and hydrogeological conditions that cause these facilities to fail. If necessary, locate developments with large amounts of impervious surfaces or a potential to produce relatively contaminated runoff away from groundwater recharge areas.

Protection of Slopes and Channels during Landscape Design

- Convey runoff safely from the tops of slopes.
- Avoid disturbing steep or unstable slopes.
- Avoid disturbing natural channels.
- Stabilize disturbed slopes as quickly as possible.
- Vegetate slopes with native or drought tolerant vegetation.
- Control and treat flows in landscaping and/or other controls prior to reaching existing natural drainage systems.
- Stabilize temporary and permanent channel crossings as quickly as possible, and ensure that increases in run-off velocity and frequency caused by the project do not erode the channel.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion. Energy dissipaters shall be installed in such a way as to minimize impacts to receiving waters.
- Line on-site conveyance channels where appropriate, to reduce erosion caused by increased flow velocity due to increases in tributary impervious area. The first choice for linings should be grass or some other vegetative surface, since these materials not only reduce runoff velocities, but also provide water quality benefits from filtration and infiltration. If velocities in the channel are high enough to erode grass or other vegetative linings, riprap, concrete, soil cement, or geo-grid stabilization are other alternatives.
- Consider other design principles that are comparable and equally effective.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Redevelopment may present significant opportunity to add features which had not previously been implemented. Examples include incorporation of depressions, areas of permeable soils, and swales in newly redeveloped areas. While some site constraints may exist due to the status of already existing infrastructure, opportunities should not be missed to maximize infiltration, slow runoff, reduce impervious areas, disconnect directly connected impervious areas.

Roof Runoff Controls SD-11

Rain Garden

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Description

Various roof runoff controls are available to address stormwater that drains off rooftops. The objective is to reduce the total volume and rate of runoff from individual lots, and retain the pollutants on site that may be picked up from roofing materials and atmospheric deposition. Roof runoff controls consist of directing the roof runoff away from paved areas and mitigating flow to the storm drain system through one of several general approaches: cisterns or rain barrels; dry wells or infiltration trenches; pop-up emitters, and foundation planting. The first three approaches require the roof runoff to be contained in a gutter and downspout system. Foundation planting provides a vegetated strip under the drip line of the roof.

Approach

Design of individual lots for single-family homes as well as lots for higher density residential and commercial structures should consider site design provisions for containing and infiltrating roof runoff or directing roof runoff to vegetative swales or buffer areas. Retained water can be reused for watering gardens, lawns, and trees. Benefits to the environment include reduced demand for potable water used for irrigation, improved stormwater quality, increased groundwater recharge, decreased runoff volume and peak flows, and decreased flooding potential.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment.

Design Considerations

Designing New Installations

Cisterns or Rain Barrels

One method of addressing roof runoff is to direct roof downspouts to cisterns or rain barrels. A cistern is an above ground storage vessel with either a manually operated valve or a permanently open outlet. Roof runoff is temporarily stored and then released for irrigation or infiltration between storms. The number of rain

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

barrels needed is a function of the rooftop area. Some low impact developers recommend that every house have at least 2 rain barrels, with a minimum storage capacity of 1000 liters. Roof barrels serve several purposes including mitigating the first flush from the roof which has a high volume, amount of contaminants, and thermal load. Several types of rain barrels are commercially available. Consideration must be given to selecting rain barrels that are vector proof and childproof. In addition, some barrels are designed with a bypass valve that filters out grit and other contaminants and routes overflow to a soak-away pit or rain garden.

If the cistern has an operable valve, the valve can be closed to store stormwater for irrigation or infiltration between storms. This system requires continual monitoring by the resident or grounds crews, but provides greater flexibility in water storage and metering. If a cistern is provided with an operable valve and water is stored inside for long periods, the cistern must be covered to prevent mosquitoes from breeding.

A cistern system with a permanently open outlet can also provide for metering stormwater runoff. If the cistern outlet is significantly smaller than the size of the downspout inlet (say ¼ to ½ inch diameter), runoff will build up inside the cistern during storms, and will empty out slowly after peak intensities subside. This is a feasible way to mitigate the peak flow increases caused by rooftop impervious land coverage, especially for the frequent, small storms.

Dry wells and Infiltration Trenches

Roof downspouts can be directed to dry wells or infiltration trenches. A dry well is constructed by excavating a hole in the ground and filling it with an open graded aggregate, and allowing the water to fill the dry well and infiltrate after the storm event. An underground connection from the downspout conveys water into the dry well, allowing it to be stored in the voids. To minimize sedimentation from lateral soil movement, the sides and top of the stone storage matrix can be wrapped in a permeable filter fabric, though the bottom may remain open. A perforated observation pipe can be inserted vertically into the dry well to allow for inspection and maintenance.

In practice, dry wells receiving runoff from single roof downspouts have been successful over long periods because they contain very little sediment. They must be sized according to the amount of rooftop runoff received, but are typically 4 to 5 feet square, and 2 to 3 feet deep, with a minimum of 1-foot soil cover over the top (maximum depth of 10 feet).

To protect the foundation, dry wells must be set away from the building at least 10 feet. They must be installed in solids that accommodate infiltration. In poorly drained soils, dry wells have very limited feasibility.

Infiltration trenches function in a similar manner and would be particularly effective for larger roof areas. An infiltration trench is a long, narrow, rock-filled trench with no outlet that receives stormwater runoff. These are described under Treatment Controls.

Pop-up Drainage Emitter

Roof downspouts can be directed to an underground pipe that daylights some distance from the building foundation, releasing the roof runoff through a pop-up emitter. Similar to a pop-up irrigation head, the emitter only opens when there is flow from the roof. The emitter remains flush to the ground during dry periods, for ease of lawn or landscape maintenance.

Foundation Planting

Landscape planting can be provided around the base to allow increased opportunities for stormwater infiltration and protect the soil from erosion caused by concentrated sheet flow coming off the roof. Foundation plantings can reduce the physical impact of water on the soil and provide a subsurface matrix of roots that encourage infiltration. These plantings must be sturdy enough to tolerate the heavy runoff sheet flows, and periodic soil saturation.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Efficient Irrigation SD-12

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Irrigation water provided to landscaped areas may result in excess irrigation water being conveyed into stormwater drainage systems.

Approach

Project plan designs for development and redevelopment should include application methods of irrigation water that minimize runoff of excess irrigation water into the stormwater conveyance system.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Designing New Installations

The following methods to reduce excessive irrigation runoff should be considered, and incorporated and implemented where determined applicable and feasible by the Permittee:

- Employ rain-triggered shutoff devices to prevent irrigation after precipitation.
- Design irrigation systems to each landscape area's specific water requirements.
- Include design featuring flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines.
- Implement landscape plans consistent with County or City water conservation resolutions, which may include provision of water sensors, programmable irrigation times (for short cycles), etc.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Design timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the storm water drainage system.
- Group plants with similar water requirements in order to reduce excess irrigation runoff and promote surface filtration. Choose plants with low irrigation requirements (for example, native or drought tolerant species). Consider design features such as:
  - Using mulches (such as wood chips or bar) in planter areas without ground cover to minimize sediment in runoff
  - Installing appropriate plant materials for the location, in accordance with amount of sunlight and climate, and use native plant materials where possible and/or as recommended by the landscape architect
  - Leaving a vegetative barrier along the property boundary and interior watercourses, to act as a pollutant filter, where appropriate and feasible
  - Choosing plants that minimize or eliminate the use of fertilizer or pesticides to sustain growth
- Employ other comparable, equally effective methods to reduce irrigation water runoff.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Storm Drain Signage SD-13

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- ☑ Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Waste materials dumped into storm drain inlets can have severe impacts on receiving and ground waters. Posting notices regarding discharge prohibitions at storm drain inlets can prevent waste dumping. Storm drain signs and stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets.

Approach

The stencil or affixed sign contains a brief statement that prohibits dumping of improper materials into the urban runoff conveyance system. Storm drain messages have become a popular method of alerting the public about the effects of and the prohibitions against waste disposal.

Suitable Applications

Stencils and signs alert the public to the destination of pollutants discharged to the storm drain. Signs are appropriate in residential, commercial, and industrial areas, as well as any other area where contributions or dumping to storm drains is likely.

Design Considerations

Storm drain message markers or placards are recommended at all storm drain inlets within the boundary of a development project. The marker should be placed in clear sight facing toward anyone approaching the inlet from either side. All storm drain inlet locations should be identified on the development site map.

Designing New Installations

The following methods should be considered for inclusion in the project design and show on project plans:

- Provide stenciling or labeling of all storm drain inlets and catch basins, constructed or modified, within the project area with prohibitive language. Examples include "NO DUMPING

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

– DRAINS TO OCEAN" and/or other graphical icons to discourage illegal dumping.

- Post signs with prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area.

Note - Some local agencies have approved specific signage and/or storm drain message placards for use. Consult local agency stormwater staff to determine specific requirements for placard types and methods of application.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. If the project meets the definition of "redevelopment", then the requirements stated under " designing new installations" above should be included in all project design plans.

Additional Information

Maintenance Considerations

- Legibility of markers and signs should be maintained. If required by the agency with jurisdiction over the project, the owner/operator or homeowner's association should enter into a maintenance agreement with the agency or record a deed restriction upon the property title to maintain the legibility of placards or signs.

Placement

- Signage on top of curbs tends to weather and fade.
- Signage on face of curbs tends to be worn by contact with vehicle tires and sweeper brooms.

Supplemental Information

Examples

- Most MS4 programs have storm drain signage programs. Some MS4 programs will provide stencils, or arrange for volunteers to stencil storm drains as part of their outreach program.

Potential Alternatives

None

Description and Purpose

Street sweeping and vacuuming includes use of self-propelled and walk-behind equipment to remove sediment from streets and roadways, and to clean paved surfaces in preparation for final paving. Sweeping and vacuuming prevents sediment from the project site from entering storm drains or receiving waters.

Suitable Applications

Sweeping and vacuuming are suitable anywhere sediment is tracked from the project site onto public or private paved streets and roads, typically at points of egress. Sweeping and vacuuming are also applicable during preparation of paved surfaces for final paving.

Limitations

Sweeping and vacuuming may not be effective when sediment is wet or when tracked soil is caked (caked soil may need to be scraped loose).

Implementation

- Controlling the number of points where vehicles can leave the site will allow sweeping and vacuuming efforts to be focused, and perhaps save money.
- Inspect potential sediment tracking locations daily.
- Visible sediment tracking should be swept or vacuumed on a daily basis.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Do not use kick brooms or sweeper attachments. These tend to spread the dirt rather than remove it.
- If not mixed with debris or trash, consider incorporating the removed sediment back into the project

Costs

Rental rates for self-propelled sweepers vary depending on hopper size and duration of rental. Expect rental rates from $58/hour (3 yd^3 hopper) to $88/hour (9 yd^3 hopper), plus operator costs. Hourly production rates vary with the amount of area to be swept and amount of sediment. Match the hopper size to the area and expect sediment load to minimize time spent dumping.

Inspection and Maintenance

- Inspect BMPs prior to forecast rain, daily during extended rain events, after rain events, weekly during the rainy season, and at two-week intervals during the non-rainy season.
- When actively in use, points of ingress and egress must be inspected daily.
- When tracked or spilled sediment is observed outside the construction limits, it must be removed at least daily. More frequent removal, even continuous removal, may be required in some jurisdictions.
- Be careful not to sweep up any unknown substance or any object that may be potentially hazardous.
- Adjust brooms frequently; maximize efficiency of sweeping operations.
- After sweeping is finished, properly dispose of sweeper wastes at an approved dumpsite.

BIO-7: Proprietary Biotreatment

Proprietary biotreatment devices are devices that are manufactured to mimic natural systems such as bioretention areas by incorporating plants, soil, and microbes engineered to provide treatment at higher flow rates or volumes and with smaller footprints than their natural counterparts. Incoming flows are typically filtered through a planting media (mulch, compost, soil, plants, microbes, etc.) and either infiltrated or collected by an underdrain and delivered to the storm water conveyance system. Tree box filters are an increasingly common type of proprietary biotreatment device that are installed at curb level and filled with a bioretention type soil. For low to moderate flows they operate similarly to bioretention systems and are bypassed during high flows. Tree box filters are highly adaptable solutions that can be used in all types of development and in all types of soils but are especially applicable to dense urban parking lots, street, and roadways.

Also known as:

- *Catch basin planter box*
- *Bioretention vault*
- *Tree box filter*

Proprietary biotreatment
Source: http://www.americastusa.com /index.php/filterra/

Feasibility Screening Considerations

- Proprietary biotreatment devices that are unlined may cause incidental infiltration. Therefore, an evaluation of site conditions should be conducted to evaluate whether the BMP should include an impermeable liner to avoid infiltration into the subsurface.

Opportunity Criteria

- Drainage areas of 0.25 to 1.0 acres.
- Land use may include commercial, residential, mixed use, institutional, and subdivisions. Proprietary biotreatment facilities may also be applied in parking lot islands, traffic circles, road shoulders, and road medians.
- Must not adversely affect the level of flood protection provided by the drainage system.

OC-Specific Design Criteria and Considerations

☐ Frequent maintenance and the use of screens and grates to keep trash out may decrease the likelihood of clogging and prevent obstruction and bypass of incoming flows.

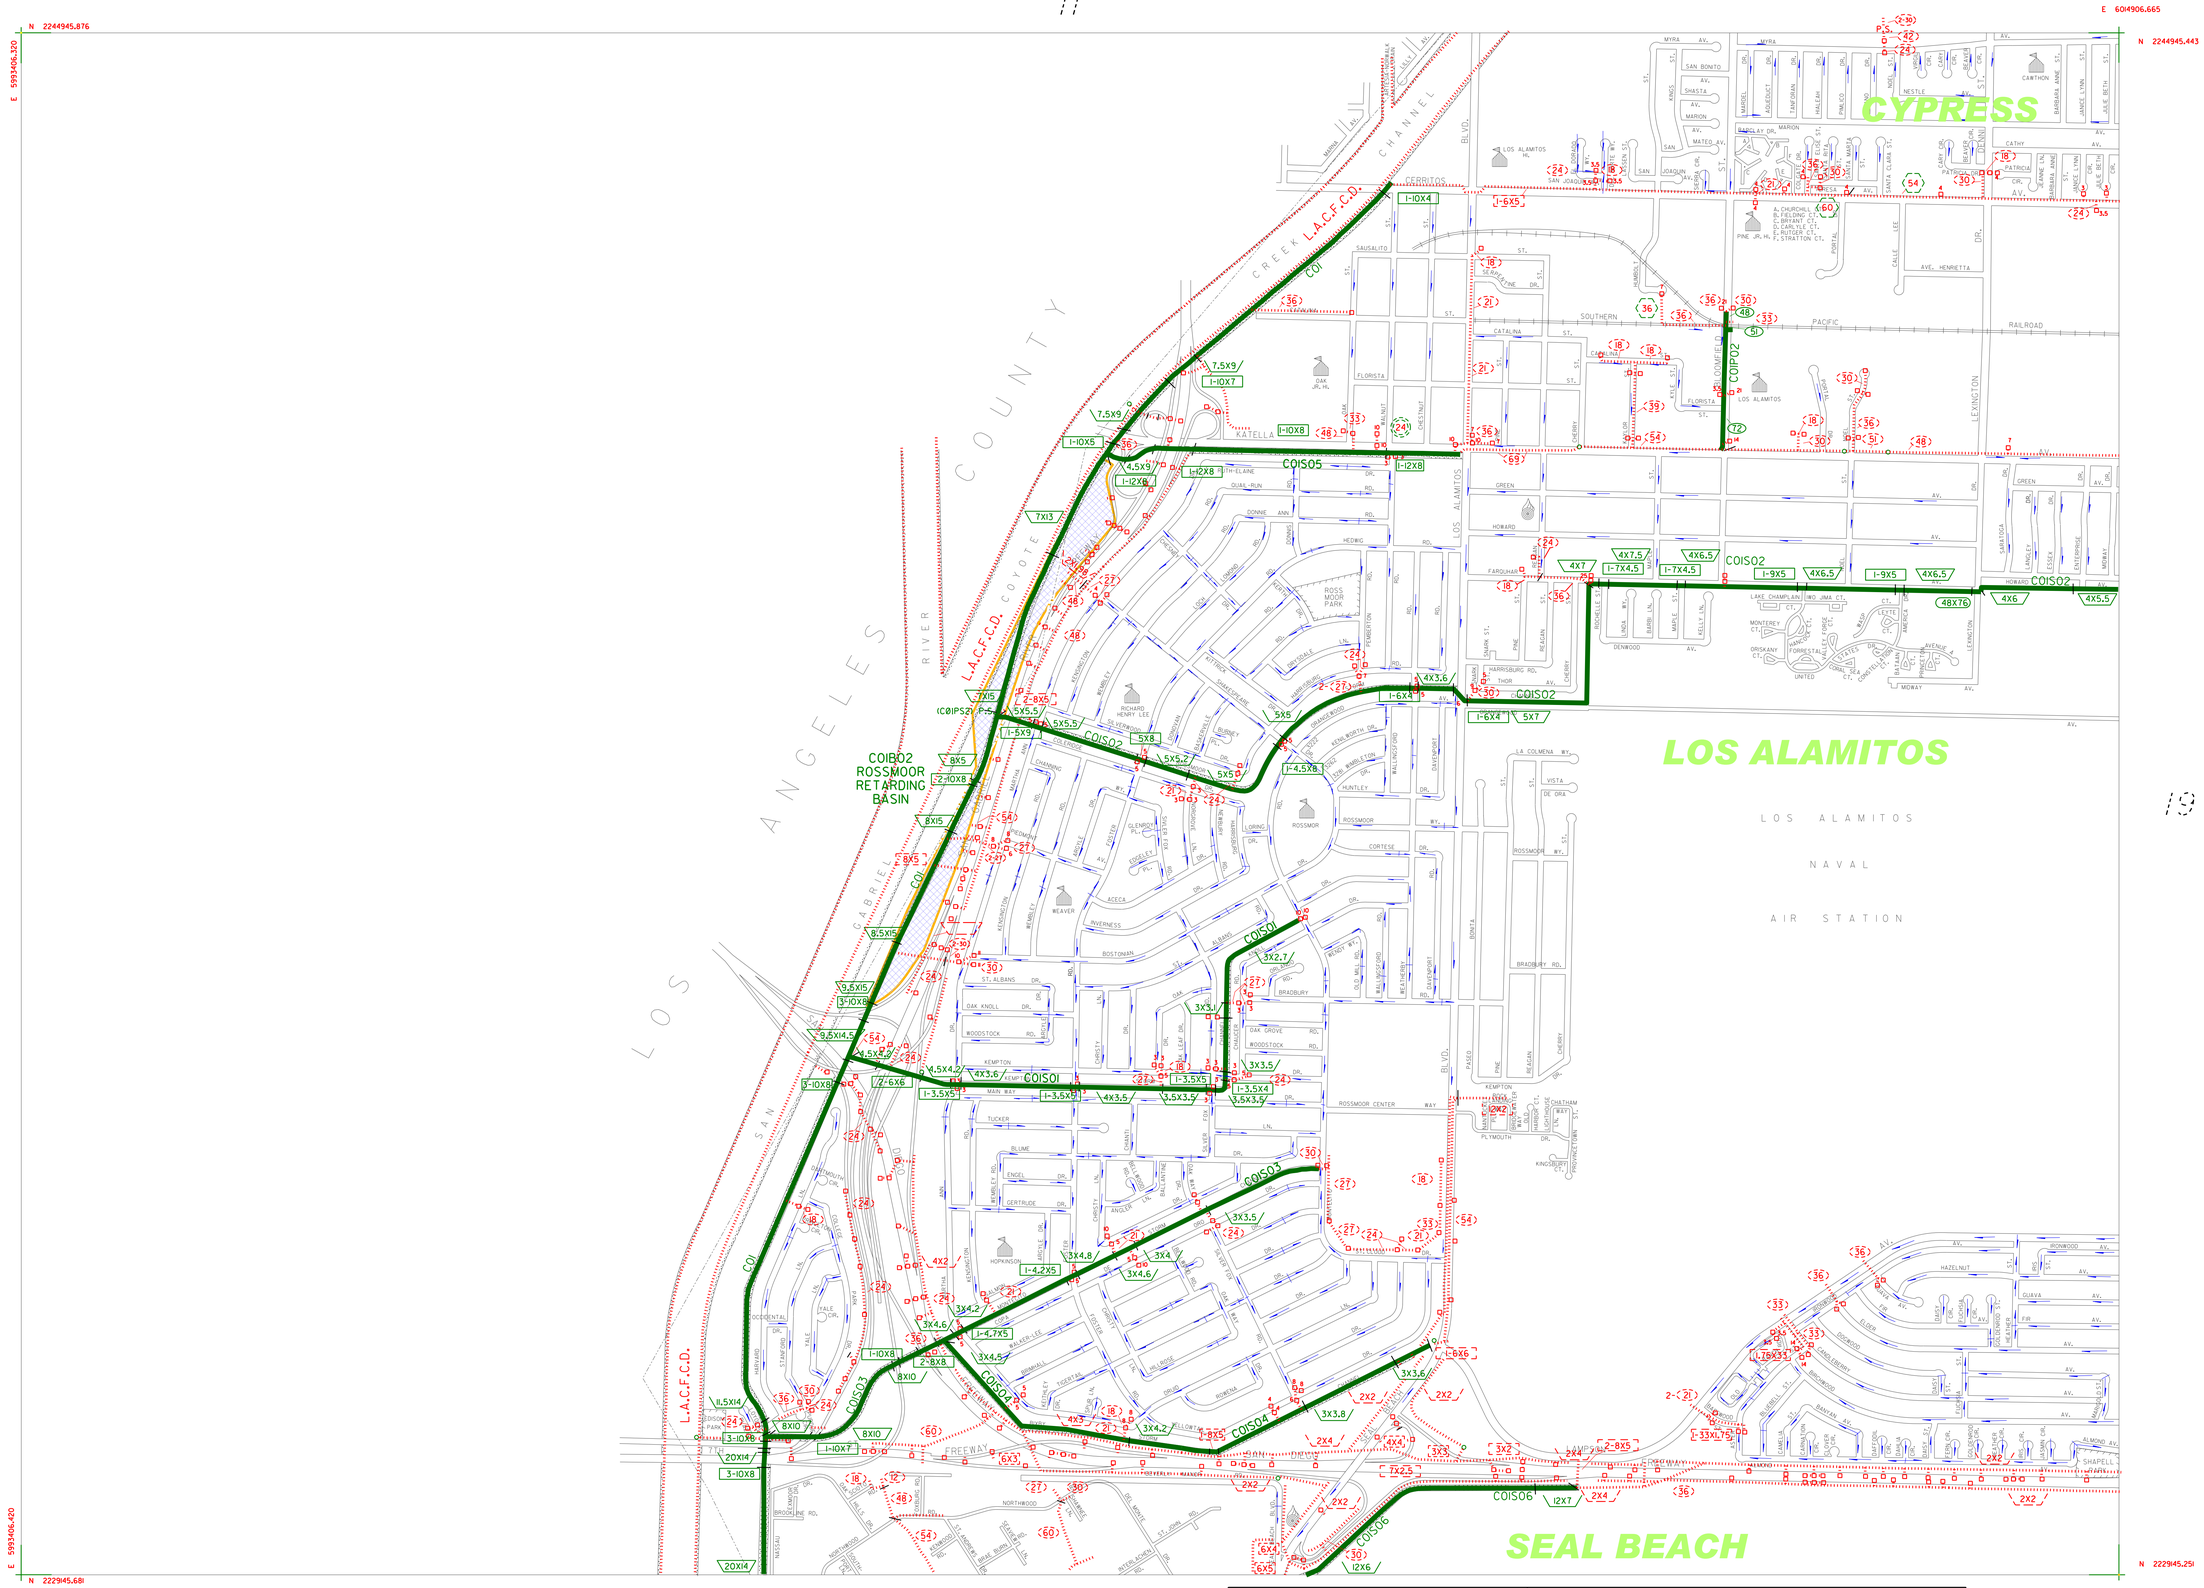
☐ Consult proprietors for specific criteria concerning the design and performance.

☐ Proprietary biotreatment may include specific media to address pollutants of concern. However, for proprietary device to be considered a biotreatment device the media must be capable of supporting rigorous growth of vegetation.

☐ Proprietary systems must be acceptable to the reviewing agency. Reviewing agencies shall have the discretion to request performance information. Reviewing agencies shall have the discretion to deny the use of a proprietary BMP on the grounds of performance, maintenance considerations, or other relevant factors.

☐ In right of way areas, plant selection should not impair traffic lines of site. Local jurisdictions may also limit plant selection in keeping with landscaping themes.

Computing Sizing Criteria for Proprietary Biotreatment Device



- Proprietary biotreatment devices can be volume based or flow-based BMPs.
- Volume-based proprietary devices should be sized using the Simple Design Capture Volume Sizing Method described in **Appendix III.3.1** or the Capture Efficiency Method for Volume-Based, Constant Drawdown BMPs described in **Appendix III.3.2**.
- The required design flowrate for flow-based proprietary devices should be computed using the Capture Efficiency Method for Flow-based BMPs described in **Appendix III.3.3)**.

In South Orange County, the provided ponding plus pore volume must be checked to demonstrate that it is greater than 0.75 of the remaining DCV that this BMP is designed to address. Many propretary biotreatment BMPs will not be able to meet the definition of "biofiltration" that applies in South Orange County. See Section III.7 and Worksheet SOC-1.

Operations and Maintenance Plan

(to be completed during final engineering)

Bio Clean

A Forterra Company

Bio Clean ARS

A Stormwater Trash Capture Solution

OPERATION & MAINTENANCE MANUAL

5796 Armada Drive Suite 250 | Carlsbad, CA 92008 | 855.566.3938

stormwater@forterrabp.com | biocleanenvironmental.com

MAINTENANCE

The Bio Clean ARS requires minimal preventative maintenance. Regular street sweeping will prevent debris from building up in front of the unit thereby obstructing storm water from entering the catch basin curb opening. The Bio Clean ARS is specially designed with flow control blades that will open during larger rain events to prevent flooding regardless of trash build up in front of the unit.

Pressure-washing the unit may be necessary if street sweeping is unavailable.

Yearly Maintenance Schedule:

Inspections consist of visually inspecting the unit from street level and performing an opening-closing function check.

Visual Inspection:

1. Built-up debris and foreign object debris can hinder the unit's operation. Remove any visible debris that may be on, in front of, and nearby the unit.

2. Look for any visible signs of vandalism or damage that may compromise the unit's ability to properly function. Attempted vandalism and slight damage should be inspected closely to ensure no future damage may result.

Opening-Closing Function Check:

1. Manually push on the blades at the bottom from the front of the catch basin. Perform this at the center and at each end of the device Please ensure all appropriate traffic control has been set up and all appropriate safety procedures are followed based on local and state regulations, if required.

2. Observe if the tension is appropriate on the blades and that the return to the close position. Note if any or all of the blades to not return to the close position.

3. Observe if the blades which are interconnecting work together. The blade being pushed on should open the most and the adjacent blades should open slight less in an outward pattern as shown below. Please note if any blades are moving or not moving outside of this pattern.

5. Check to see if the tensioner and cable/spring is properly connected behind each blade. Note any issues related to the cable/spring not being connected.

Blades Maintenance/Adjustment/Replacement:

1. Verify which Blade is damaged and plan which faceplate is easiest and most efficient to remove.
2. Remove Faceplate from brackets and remove tension spring from back of unit.
3. Slide each blade off until damaged blade has been reached. Replace damaged blade or blades.
4. Feed tensioner spring through all the back clips and attach faceplate to top bar.
5. Secure tensioner spring on back of unit and secure faceplate to mounted bracket

LA-ARS Locking Screen: Torsion Spring and Adjustment Knob System Maintenance

1. Verify unit does not have damage blades and working properly
2. Check the status of the locking system making sure the system can tighten by first releasing the unit by pressing on the releases on each side of the unit. If unit releases, proceed to next step
3. Check the status of the tension knob by clicking it tighter to make sure the unit tightens with each click of the tightening knob. If unit tightens, maintenance is complete.
4. If unit does not tighten or release, remove faceplates from bracket and remove torsion spring system. Both Torsion Spring and Adjustment knob units will need to be replaced.
5. Screw new torsion spring and adjustment knob system into place and place metal wire into plastic holding system on back of each blade.
6. Test unit by tightening and releasing the locking system. If unit is working properly, reinstall unit.

Replacement Schedule:

All components on the on the Bio Clean ARS are made from 304 or 316 stainless steel parts with the exception of the flow control blades which are made of structural polymer. Replacement of individual blades is quick and easy. If during maintenance inspection it is observed the unit is damaged or vandalized to the point at which the opening-closing function is not operating correctly, the unit should be repaired. Bio Clean Environmental should be notified if a replacement parts or repair work is needed.

Cleaning and Maintenance Report 14

OVERVIEW

The Modular Wetlands® Linear Biofilter is designed to remove high levels of trash, debris, sediments, nutrients, metals, and hydrocarbons. Its simple design allows for quick and easy installation. The system is housed in a standard precast structure and can be installed at various depths to meet site-specific conditions.

INTRODUCTION

This is the Modular Wetlands Linear Biofilter operation and maintenance manual. Before starting, read the instructions and equipment lists closely. It is important to follow all necessary safety procedures associated with state and local regulations. Some steps required confined space entry. Please contact Contech for more information on pre-authorized third party contractors who can provide installation services in your area. For a list of service providers in your area please visit: www.conteches.com/maintenance.

INSTRUCTIONS

INSPECTION SUMMARY

Stormwater regulations require BMPs be inspected and maintained to ensure they are operating as designed to allow for effective pollutant removal and provide protection to receiving water bodies. It is recommended that inspections be performed multiple times during the first year to assess the site specific loading conditions. The first year of inspections can be used to set inspection and maintenance intervals for subsequent years to ensure appropriate maintenance is provided.

- Inspect pre-treatment, biofiltration, and discharge chambers an average of once every six to twelve months. Varies based on site specific and local conditions.
- Average inspection time is approximately 15 minutes. Always ensure appropriate safety protocol and procedures are followed.

The following is a list of equipment required to allow for simple and effective inspection of the Modular Wetlands Linear:

- Modular Wetlands Linear Inspection Form
- Flashlight
- Manhole hook or appropriate tools to remove access hatches and covers
- Appropriate traffic control signage and procedures
- Measuring pole and/or tape measure
- Protective clothing and eye protection
- 7/16" open or closed ended wrench
- Large permanent black marker (initial inspections only - first year)

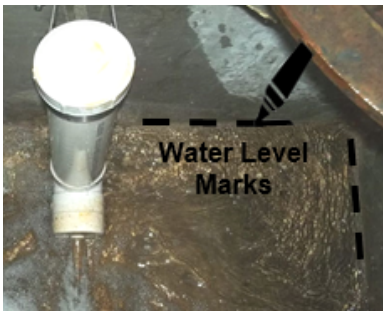
Note: entering a confined space requires appropriate safety and certification. It is generally not required for routine inspections of the system

INSPECTION AND MAINTENANCE NOTES

1. Following maintenance and/or inspection, it is recommended that the maintenance operator prepare a maintenance/inspection record. The record should include any maintenance activities performed, amount and description of debris collected, and condition of the system and its various filter mechanisms.
2. The owner should keep maintenance/inspection record(s) for a minimum of five years from the date of maintenance. These records should be made available to the governing municipality for inspection upon request at any time.
3. Transport all debris, trash, organics, and sediments to approved facility for disposal in accordance with local and state requirements.
4. Entry into chambers may require confined space training based on state and local regulations.
5. No fertilizer shall be used in the biofiltration chamber.
6. Irrigation should be provided as recommended by manufacturer and/or landscape architect. Amount of irrigation required is dependent on plant species. Some plants may not require irrigation after initial establishment.

INSPECTION PROCESS

1. Prepare the inspection form by writing in the necessary information including project name, location, date & time, unit number and other information (see inspection form).
2. Observe the inside of the system through the access covers. If minimal light is available and vision into the unit is impaired, utilize a flashlight to see inside the system and all of its chambers.
3. Look for any out of the ordinary obstructions in the inflow pipe, pre-treatment chamber, biofiltration chamber, discharge chamber or outflow pipe. Write down any observations on the inspection form.
4. Through observation and/or digital photographs, estimate the amount of trash, debris accumulated in the pre-treatment chamber. Utilizing a tape measure or measuring stick, estimate the amount of sediment in this chamber. Record this depth on the inspection form.
5. Through visual observation, inspect the condition of the pre-filter cartridges. Look for excessive build-up of sediment on the cartridges, any build-up on the tops of the cartridges, or clogging of the holes. Record this information on the inspection form. The prefilter cartridges can be further inspected by removing the cartridge tops and assessing the color of the BioMediaGREEN filter cubes (requires entry into pre-treatment chamber - see notes previous notes regarding confined space entry). Record the color of the material. New material is a light green color. As the media becomes clogged, it will turn darker in color, eventually becoming dark brown or black. The closer to black the media is the higher percentage that the media is exhausted and is in need of replacement.



6. The biofiltration chamber is generally maintenance-free due to the system's advanced pre-treatment chamber. For units which have open planters with vegetation, it is recommended that the vegetation be inspected. Look for any plants that are dead or showing signs of disease or other negative stressors. Record the general health of the plants on the inspection form and indicate through visual observation or digital photographs if trimming of the vegetation is required.
7. The discharge chamber houses the orifice control structure, drain down filter (only in California - older models), and is connected to the outflow pipe. It is important to check to ensure the orifice is in proper operating conditions and free of any obstructions. It is also important to assess the condition of the drain down filter media which utilizes a block form of the BioMediaGREEN. Assess in the same manner as the cubes in the pre-filter cartridge as mentioned above. Generally, the discharge chamber will be clean and free of debris. Inspect the water marks on the side walls. If possible, inspect the discharge chamber during a rain event to assess the amount of flow leaving the system while it is at 100% capacity (pre-treatment chamber water level at peak HGL - top of bypass weir). The water level of the flowing water should be compared to the watermark level on the side walls, which is an indicator of the highest discharge rate the system achieved when initially installed. Record on the form if there is any difference in level from the watermark in inches.

NOTE: During the first few storms, the water level in the outflow chamber should be observed and a 6" long horizontal watermark line drawn (using a large permanent marker) at the water level in the discharge chamber while the system is operating at 100% capacity. The diagram below illustrates where the line should be drawn. This line is a reference point for future inspections of the system.

Water level in the discharge chamber is a function of flow rate and pipe size. Observation of the water level during the first few months of operation can be used as a benchmark level for future inspections. The initial mark and all future observations shall be made when the system is at 100% capacity (water level at maximum level in the pre-treatment chamber). If future water levels are below this mark when the system is at 100% capacity, this is an indicator that maintenance to the pre-filter cartridges may be needed.

8. Finalize the inspection report for analysis by the maintenance manager to determine if maintenance is required.

MAINTENANCE INDICATORS

Based upon the observations made during inspection, maintenance of the system may be required based on the following indicators:

- Missing or damaged internal components or cartridges
- Obstructions in the system or its inlet and/or outlet pipes
- Excessive accumulation of floatables in the pretreatment chamber in which the length and width of the chamber is fully impacted more than 18". See photo below.
- Excessive accumulation of sediment in the pretreatment chamber of more than 6" in depth.
- Excessive accumulation of sediment on the BioMediaGREEN media housed within the pretreatment cartridges. The following chart shows photos of the condition of the BioMediaGREEN contained within the pre-filter cartridges. When media is more than 85% clogged, replacement is required.
- Excessive accumulation of sediment on the BioMediaGREEN media housed within the pretreatment cartridges. When media is more than 85% clogged, replacement is required. The darker the BioMediaGREEN, the more clogged it is and in need of replacement.

INSPECTION PROCESS

- Excessive accumulation of sediment on the BioMediaGREEN media housed within the drain down filter (California only - older models). The following photos show the condition of the BioMediaGREEN contained within the drain down filter. When media is more than 85% clogged, replacement is required.

- Overgrown vegetation.

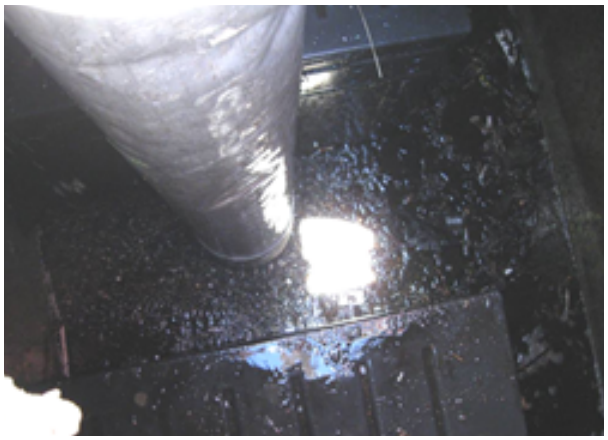
- Water level in the discharge chamber during 100% operating capacity (pretreatment chamber water level at max height) is lower than the water mark by 20%.

MAINTENANCE SUMMARY

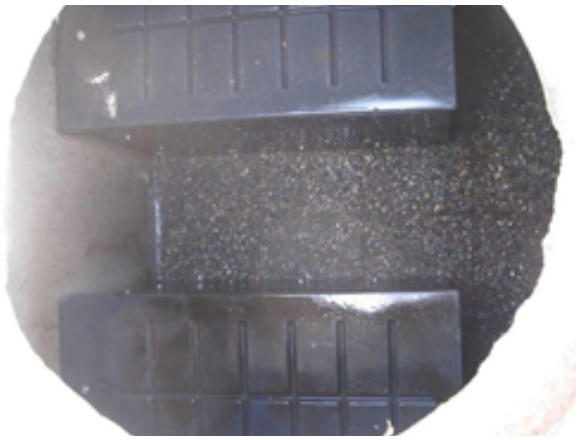
The time has come to maintain your Modular Wetlands® Linear. All necessary pre-maintenance steps must be carried out before maintenance occurs. Once traffic control has been set up per local and state regulations and access covers have been safely opened, the maintenance process can begin. It should be noted that some maintenance activities require confined space entry. All confined space requirements must be strictly followed before entry into the system. In addition, the following is recommended:

- Prepare the maintenance form by writing in the necessary information including project name, location, date & time, unit number and other info (see maintenance form).
- Set up all appropriate safety and cleaning equipment.
- Ensure traffic control is set up and properly positioned.
- Prepared pre-checks (OSHA, safety, confined space entry) are performed.

The following is a list of equipment to required for maintenance of the Modular Wetlands® Linear:

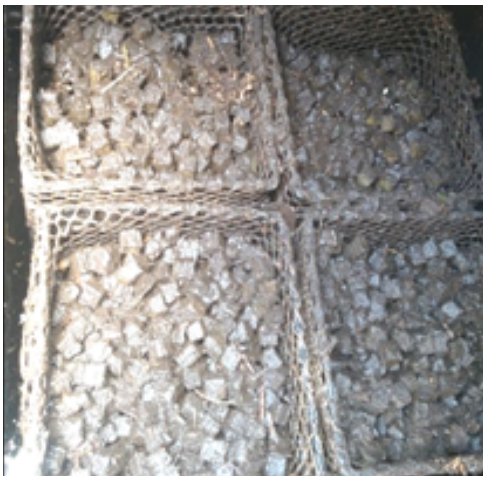


- Modular Wetlands Linear Maintenance Form
- Manhole hook or appropriate tools to access hatches and covers
- Protective clothing, flashlight, and eye protection
- 7/16" open or closed ended wrench
- Vacuum assisted truck with pressure washer
- Replacement BioMediaGREEN for pre-filter cartridges if required (order from one of Contech's Maintenance Team members at https://www.conteches.com/maintenance).



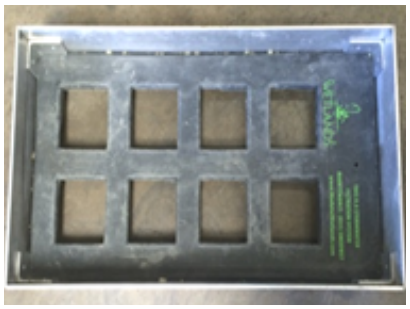
MAINTENANCE | PRETREATMENT CHAMBER

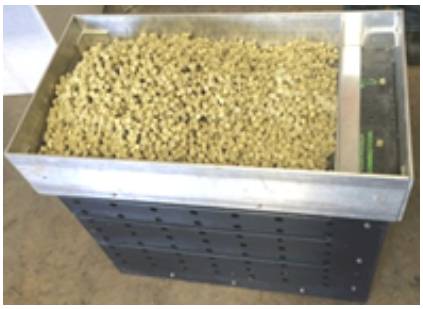
1. Remove access cover over pre-treatment chamber and position vacuum truck accordingly.
2. With a pressure washer, spray down pollutants accumulated on walls and pre-filter cartridges.
3. Vacuum out pre-treatment chamber and remove all accumulated pollutants including trash, debris, and sediments. Be sure to vacuum the floor until the pervious pavers are visible and clean.
4. If pre-filter cartridges require media replacement, continue to step 5. If not, replace access cover and move to step 11.



MAINTENANCE | PREFILTER CARTRIDGES

5. After successfully cleaning out the pre-treatment chamber (previous page) enter the pre-treatment chamber.
6. Unscrew the two bolts (circles shown below) holding the lid on each cartridge filter and remove lid.





7. Place the vacuum hose over each individual media filter to suck out filter media.

8. Once filter media has been sucked out, use a pressure washer to spray down the inside of the cartridge and it's media cages. Remove cleaned media cages and place to the side. Once removed, the vacuum hose can be inserted into the cartridge to vacuum out any remaining material near the bottom of the cartridge.
9. Reinstall media cages and fill with new media from the manufacturer or outside supplier. Manufacturer will provide specification of media and sources to purchase. Utilize the manufacture-provided refilling tray and place on top of the cartridge. Fill the tray with new bulk media and shake down into place. Using your hands, lightly compact the media into each filter cage. Once the cages are full, remove the refilling tray and replace the cartridge top, ensuring bolts are properly tightened.

10. Exit the pre-treatment chamber. Replace access hatch or manhole cover.

MAINTENANCE | BIOFILTRATION CHAMBER

11. In general, the biofiltration chamber is maintenance-free with the exception of maintaining the vegetation. The Modular Wetlands Linear utilizes vegetation similar to surrounding landscape areas, therefore trim vegetation to match surrounding vegetation. If any plants have died, replace them with new ones.

12. Each vertical under drain on the biofiltration chamber has a removable (threaded cap) that can be taken off to check any blockages or root growth. Once removed, a jetting attachment can be used to clean out the under drain and orifice riser.
13. As with all biofilter systems, at some point the biofiltration media (WetlandMedia) will need to be replaced. Either because of physical clogging of sorptive exhaustion of the media ion exchange capacity (to remove dissolved metals and phosphorous). The general life of this media is 10 to 20 years based on site specific conditions and pollutant loading. Utilize the vacuum truck to vacuum out the media by placing the hose into the chamber. Once all the media is removed use the power washer to spray down all the netting on the outer metal cage. Inspect the netting for any damage or holes. If the netting is damaged it can be repaired or replaced with guidance by the manufacturer.
14. Contact one of Contech's Maintenance Team members at https://www.conteches.com/maintenance to order new WetlandMedia. The quantity of media needed can be determined by providing the model number and unit depth. Media will be provided in super sacks for easy installation. Each sack will weigh between 1000 and 2000 lbs. A lifting apparatus (backhoe, boom truck, or other) is recommended to position the super sack over the biofiltration chamber. Fill the media cages up to the same level as the old media. Replant with vegetation.

MAINTENANCE | DISCHARGE CHAMBER

15. Remove access hatch or manhole cover over discharge chamber.
16. Enter chamber to gain access to the drain down filter. Unlock the locking mechanism and lift up drain down filter housing to remove used BioMediaGREEN filter block as shown below. *NOTE: Drain down filter is only found on units installed in California prior to 2023. If no drain down filter is present, skip steps 16 and 17.*

17. Insert a new BioMediaGREEN filter block and lock drain down filter housing back in place.
18. Replace access hatch or manhole cover over discharge chamber.

Inspection Checklist

Modular Wetland System Type (Curb, Grate or UG Vault): _____ Size (22', 14' or etc.): _____

Structural Integrity:	**Yes**	**No**	**Comments**
Damage to pre-treatment access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Damage to discharge chamber access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Does the MWS unit show signs of structural deterioration (cracks in the wall, damage to frame)?			
Is the inlet/outlet pipe or drain down pipe damaged or otherwise not functioning properly?			
Working Condition:			
Is there evidence of illicit discharge or excessive oil, grease, or other automobile fluids entering and clogging the unit?			
Is there standing water in inappropriate areas after a dry period?			
Is the filter insert (if applicable) at capacity and/or is there an accumulation of debris/trash on the shelf system?			
Does the depth of sediment/trash/debris suggest a blockage of the inflow pipe, bypass or cartridge filter? If yes, specify which one in the comments section. Note depth of accumulation in in pre-treatment chamber.			Depth:
Does the cartridge filter media need replacement in pre-treatment chamber and/or discharge chamber?			Chamber:
Any signs of improper functioning in the discharge chamber? Note issues in comments section.			
Other Inspection Items:			
Is there an accumulation of sediment/trash/debris in the wetland media (if applicable)?			
Is it evident that the plants are alive and healthy (if applicable)? Please note Plant Information below.			
Is there a septic or foul odor coming from inside the system?			

Waste:	**Yes**	**No**
Sediment / Silt / Clay		
Trash / Bags / Bottles		
Green Waste / Leaves / Foliage		

Recommended Maintenance	
No Cleaning Needed	
Schedule Maintenance as Planned	
Needs Immediate Maintenance

Year 8	1) Clean Inlet Filter (6 Month Intervals) (does not apply to vault type) 2) Vacuum Catch Basin (12 Month Intervals) 3) Replace BioMedia Green Filter Media (12 month Intervals)	10 Minutes 25 Minutes 45 Minutes
Year 9…	1) Clean Inlet Filter (6 Month Intervals) (does not apply to vault type) 2) Vacuum Catch Basin (12 Month Intervals) 3) Replace BioMedia Green Filter Media (12 month Intervals)	10 Minutes 25 Minutes 45 Minutes
Year 15	1) Clean Inlet Filter (6 Month Intervals) (does not apply to vault type) 2) Vacuum Catch Basin (12 Month Intervals) 3) Replace BioMedia Green Filter Media (12 month Intervals) 4) Remove & Replace Wetland Plants & Media (every 10-20 years)	10 Minutes 25 Minutes 45 Minutes 6 to 8 Hours
Procedure 1 **Clean Inlet Filter** (does not apply to vault type) 	Modular Wetland Systems, Inc. recommends the catch basin filter be inspected and cleaned a minimum of once every six months and replacement of hydrocarbon booms once a year. The procedure is easily done with the use of any standard vacuum truck. Before doing maintenance please use proper safety and traffic control. 1) Remove grate or manhole, remove the deflector shield (grate type only). Note: entry into an underground stormwater vault such as an inlet vault requires certification in confined space training. 2) Remove all trash, debris, organics, and sediments collected by the inlet filter insert either manually or with the use of a vactor truck. 3) Evaluate hydrocarbon boom. If the boom is filled with hydrocarbons and oils it should be replaced. Attach new boom to basket with plastic ties through pre-drilled holes in basket. Place the deflector shield (grate type only) back into the filter. Hydrocarbon boom should be replaced annually. (The hydrocarbon boom may be classified as hazardous material and will have to be picked up and disposed of as hazardous waste).	**10 Minutes**

Procedure 2 **Vacuum Catch Basin** 	Modular Wetland Systems, Inc. recommends the separation chamber be inspected and cleaned a minimum of once a year. The procedure is easily done with the use of any standard vacuum truck. Before doing maintenance please use proper safety and traffic control. 1) Remove grate or manhole. 2) Remove catch basin filter. 3) Spray down pollutants accumulated on cartridge filters and catch basin walls. 4) Vacuum out sediments and debris accumulated on catch basin floor. 5) Replace catch basin filter, and replace grate or manhole cover.	**25 Minutes**
Procedure 3 **Replace BioMedia Green Media Filter**   	Modular Wetland Systems, Inc. recommends the BioMediaGREEN Cartridge Filters be inspected and cleaned a minimum of once a year. The procedure will require prior maintenance of catch basin. Before doing maintenance please use proper safety and traffic control. 1) Remove grate, remove catch basin filter. 2) Perform maintenance activities on catch basin. 3) Enter separation chamber, unscrew the two bolts holding the lid on the cartridge filter. This will expose the 14 pieces of BioMediaGREEN in each cartridge. 4) Evaluate media condition, replace if necessary. If the spaces between the media are filled with sediment and the surface of the media is dark brown or black the media should be replaced. The old media can be removed by hand by pulling the media pieces up out of the cartridge and taking them out of the catch basin. 5) Once all old media is removed, spray down the interior of the cartridge and vacuum out accumulated debris. 6) Use new pieces of BioMediaGREEN and slide down over the perforated PVC risers. The media will only go in one way for easy installation. Replace media over all risers. 5) Replace cartridge filter lid, replace catch basin filter, and replace grate or manhole cover. Modular Wetland Systems, Inc. recommends the drain down filter be inspected and maintained a minimum of once a year. 1) Open hatch of discharge chamber, enter chamber. 2) Unlatch fiberglass cover, remove media block, replace with new block, replace and latch cover. 3) Exit chamber, close and lock down the hatch. BioMediaGREEN	**45 Minutes**
Procedure 4 **Replace Wetland Media** 	Modular Wetland Systems, Inc. recommends the wetland media be evaluated every 3 to 5 years to test flow rate. The media life is approximately 15 to 20 years. The wetland media is an expanded shale that can be ordered from the manufacturer or independent supplier. If the flow through the wetland filter is decreasing the internal inflow and outflow pipes leading to and from the wetland chamber can be jetted. If the flow through the wetland is still minimal then the media may need to be replaced. To replace the media the following steps are required. Before doing maintenance please use proper safety and traffic control. 1) Remove plants and dispose. Have new plants standing ready to plant. 2) Use a larger vacuum truck to remove the media from the wetland chamber. 3) Spray down the chamber walls and remove all sediment and water. 4) Replace with new wetland media and plant plants.	**6 to 8 Hours**

Subject: ***Preliminary Geotechnical Evaluation and Design Recommendations for Proposed Single-Family and Multi-Family Residential Development, 4665 Lampson Avenue, Los Alamitos, California***

In accordance with your request and authorization, LGC Geotechnical, Inc. has performed a preliminary geotechnical evaluation for the proposed single-family and multi-family residential development located at 4665 Lampson Avenue in the City of Los Alamitos, California. The purpose of our study was to evaluate the existing onsite geotechnical conditions and to provide preliminary geotechnical recommendations relative to the proposed residential development.

Should you have any questions regarding this report, please do not hesitate to contact our office. We appreciate this opportunity to be of service.

Respectfully Submitted,

LGC Geotechnical, Inc.

1.0 INTRODUCTION

1.1 Purpose and Scope of Services

This report presents the results of our preliminary geotechnical evaluation for the proposed single-family and multi-family residential development located at 4665 Lampson Avenue in the City of Los Alamitos, California. Refer to the Site Location Map (Figure 1).

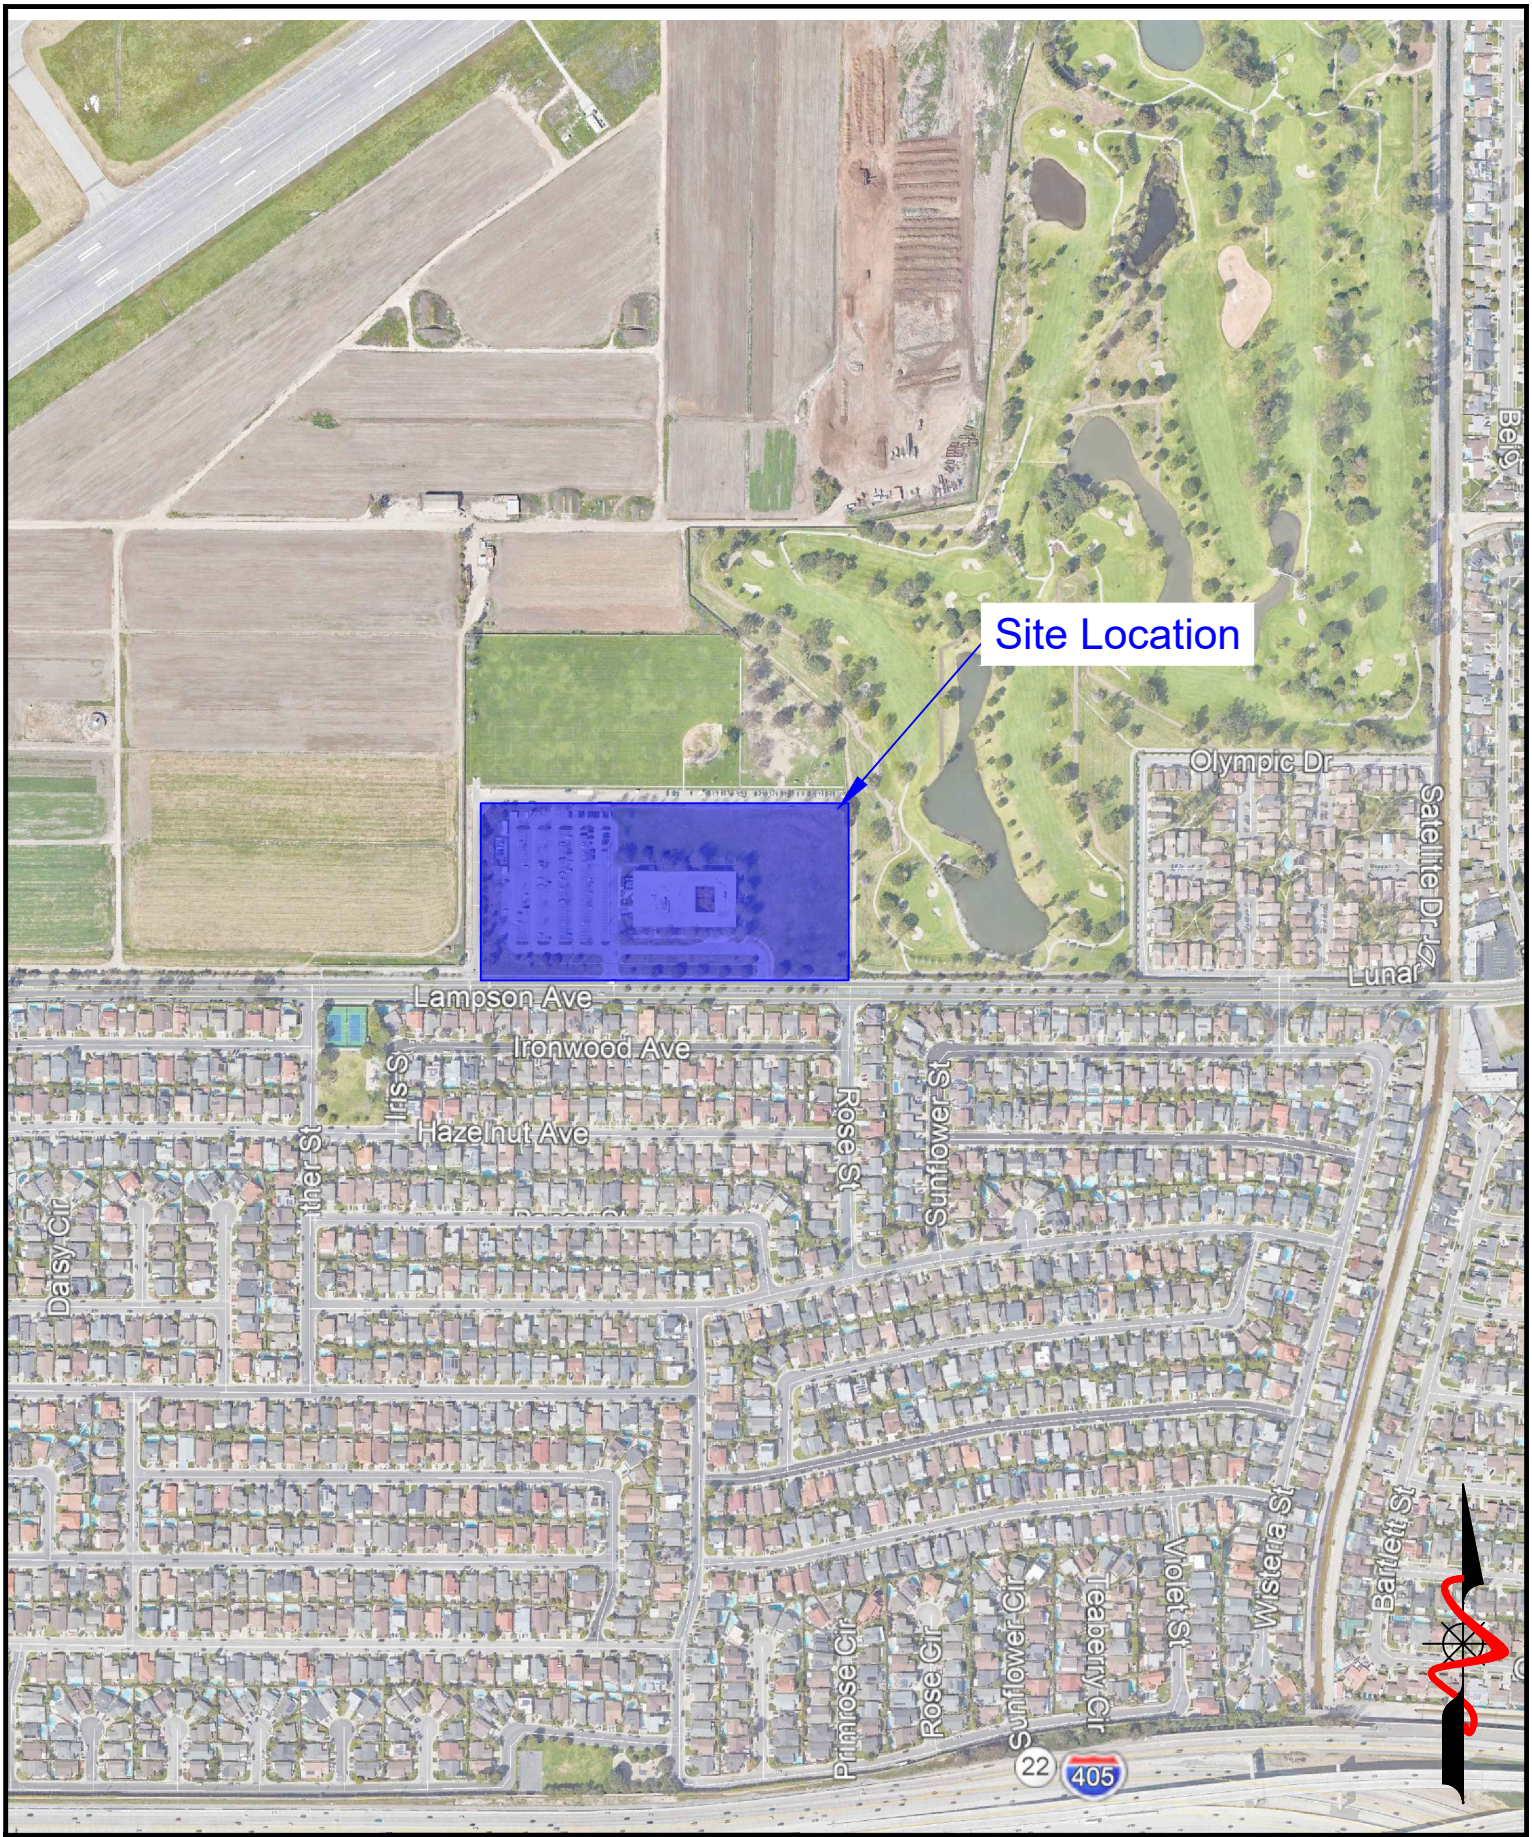
The purpose of our study was to provide a preliminary geotechnical evaluation relative to the proposed residential development. As part of our scope of work, we have: 1) reviewed available geotechnical background information including in-house regional geologic maps and published geotechnical literature pertinent to the site (Appendix A); 2) performed a limited subsurface geotechnical evaluation of the site consisting of the excavation of seven small-diameter borings ranging in depth from approximately 5 to 46.5 feet below existing ground surface; 3) performed two field infiltration tests; 4) performed laboratory testing of select soil samples obtained during our subsurface evaluation; and 5) prepared this preliminary geotechnical summary report presenting our findings, preliminary conclusions and recommendations for the development of the proposed residential project.

It should be noted that our evaluation and this report only address geotechnical issues associated with the site and do not address any environmental issues.

1.2 Project Description

Based on the preliminary site plan (KTGY, 2021), the proposed development includes the construction of 102 single-family residential lots and 90 affordable multi-family units. Proposed site improvements include a park and a series of internal streets. Design cuts and fills (not including required remedial grading) are anticipated to be on the order of 1 to 3 feet. The proposed building structures are anticipated to be relatively light-weight at-grade structures with maximum column and wall loads of approximately 30 kips and 2 kips per linear foot, respectively. Please note no grading plans or structural loads were provided to us at the time of this report.

The recommendations given in this report are based upon the estimated structural loading, grading and layout information above. We understand that the project plans are currently being developed at this time; LGC Geotechnical should be provided with updated project plans and any changes to structural loads when they become available, in order to either confirm or modify the recommendations provided herein. Additional field work and/or laboratory testing may be necessary.



1.3 Existing Conditions

The site is approximately 12 acres and is bound to the south by Lampson Avenue, to the east by a golf course, to the north by a park and to the west by vacant land. The site is currently occupied by the California Department of Fish and Wildlife with an associated parking lot and open space.

The site has minor relief, with the highest being the northern side of the site and gently slopes gently from north to south.

1.4 Background

Review of historical aerials indicates that the building and associated improvements were constructed after 1963, but prior to 1972 and remained relatively unchanged since (Historic Aerials, 2021). Aerial photos from 1952 and 1963 indicate the site was previously raw land.

1.5 Subsurface Geotechnical Evaluation

LGC Geotechnical performed a subsurface geotechnical evaluation of the site consisting of the excavation of five hollow-stem auger borings and two hand-auger borings to evaluate onsite geotechnical conditions.

Five hollow-stem borings (HS-1 through HS-3, I-1, and I-2) were drilled to depths ranging from approximately 5 to 46.5 feet below existing grade. An LGC Geotechnical staff engineer observed the drilling operations, logged the borings, and collected soil samples for laboratory testing. The borings were excavated by Cal Pac Drilling, Inc. under subcontract to LGC Geotechnical using a truck-mounted drill rig equipped with 6 and 8-inch-diameter hollow-stem augers. Driven soil samples were collected by means of the Standard Penetration Test (SPT) and Modified California Drive (MCD) sampler generally obtained at 2.5 to 5-foot vertical increments. The MCD is a split-barrel sampler with a tapered cutting tip and lined with a series of 1-inch-tall brass rings. The SPT sampler (1.4-inch ID) and MCD sampler (2.4-inch ID, 3.0-inch OD) were driven using a 140-pound automatic hammer falling 30 inches to advance the sampler a total depth of 18 inches. The raw blow counts for each 6-inch increment of penetration were recorded on the boring logs. Bulk samples of the near-surface soils were also collected and logged at select borings for laboratory testing. At the completion of drilling, the borings were backfilled with the native soil cuttings and tamped. Some settlement of the backfill soils may occur over time.

Two hand auger borings (HA-1 and HA-2) were excavated to approximately 5 feet below the existing surface, sampled, logged, and backfilled. The approximate locations of our hand auger borings are presented on our Boring Location Map (Figure 2). The boring logs are presented in Appendix B.

Infiltration testing was performed within two of the borings (I-1 and I-2) to depths of approximately 5 feet below existing grade. An LGC Geotechnical geologist installed standpipes, backfilled the borings with crushed rock and pre-soaked the infiltration holes prior to testing. Infiltration testing was performed per the County of Orange testing guidelines. Standpipes were removed and the locations were subsequently backfilled with native soils at the completion of testing. Some settlement of the backfill soils may occur over time.

The approximate locations of our subsurface explorations are provided on the Boring Location Map (Figure 2). The boring logs are provided in Appendix B.

1.6 Laboratory Testing

Representative bulk and driven (relatively undisturbed) samples were obtained for laboratory testing during our field evaluation. Laboratory testing included in-situ moisture content and in-situ dry density, fines content, Atterberg Limits, expansion index, consolidation, direct shear, laboratory compaction and corrosion (sulfate, chloride, pH and minimum resistivity).

The following is a summary of the laboratory test results:

- Dry density of the samples collected ranged from approximately 87 pounds per cubic foot (pcf) to 111 pcf, with an average of 99 pcf. Field moisture contents ranged from approximately 9 to 35 percent, with an average of 25 percent.

- Two fines content tests were performed and indicated a fines content (passing No. 200 sieve) of approximately 15 and 16.5 percent. Based on the Unified Soils Classification System (USCS), the tested samples would be classified as "coarse-grained."
- Four Atterberg Limit (liquid limit and plastic limit) tests were performed. Results indicated a Plasticity Index (PI) value ranging from 12 to 24.
- Two consolidation tests were performed. The load versus deformation plots are provided in Appendix C.
- One remolded direct shear test was performed. The plot is provided in Appendix C.
- One laboratory compaction test of a near surface sample indicated a maximum dry density of 116.0 pcf with an optimum moisture content of 13.0 percent.
- Two Expansion potential tests were performed and indicated an expansion index value of 30 and 32, corresponding to "Low" expansion potential.
- Corrosion testing indicated soluble sulfate contents ranging from approximately 0.032 to 0.254 percent, a chloride content ranging from 140 to 600 parts per million (ppm), pH of 8.92, and a minimum resistivity of 210 ohm-centimeters.

A summary of the laboratory test results is presented in Appendix C. The moisture and dry density results are presented on the boring logs in Appendix B.

2.0 GEOTECHNICAL CONDITIONS

2.1 Geologic Conditions

The subject site is located within the Orange County coastal plain, more generally located on the broad southern margin of the Los Angeles Basin. The site is located more specifically within the Santa Ana River drainage basin, and it is underlain at depth by poorly consolidated alluvial sediments mapped as Quaternary Young Alluvial Fan deposits "Unit 2" (Qya_2) (USGS, 2016).

2.2 Site-Specific Geology

Based on the results of our subsurface investigation, the site is underlain by a thin veneer of topsoil and older artificial fill over young alluvial deposits of Holocene age, per regional geologic mapping (USGS, 2016). The materials are described on the boring logs presented in Appendix B.

The young alluvial sediments encountered during our subsurface exploration generally consist of interbedded layers of gray and brown, silty clay, clay, silty sand, and clayey sand. The materials were observed to be very moist to wet with depth, soft to very stiff and medium dense to dense.

2.3 Groundwater

Groundwater was encountered in three of our borings (HS-1 through HS-3) at depths of approximately 11 to 13 feet below existing grade. Additionally, historic high groundwater is estimated to be about 10 feet below existing grade (CDMG, 1998). The location and approximate depth of groundwater is summarized in Table 1 below.

TABLE 1

Groundwater Summary

Boring Number	Total Drilled Depth of Boring (ft)	Groundwater Depth Below Existing Grade (ft)
HS-1	21.5	13
HS-2	46.5	11.5
HS-3	21.5	11

Seasonal fluctuations of groundwater elevations should be expected over time. In general, groundwater levels fluctuate with the seasons and local zones of perched groundwater may be present due to local seepage caused by irrigation and/or recent precipitation. Local perched groundwater conditions or surface seepage may develop once site development is completed.

2.4 Field Infiltration Testing

Two field percolation tests were performed in locations and depths per the direction of the project civil engineer, the location is depicted on Figure 2 – Boring Location Map. Test well installation consisted of placing a 3-inch diameter perforated PVC pipe in the excavated 8-inch diameter borehole and backfilling the annulus with crushed rock including the placement of approximately 2 inches of crushed rock at the bottom of the borehole. The infiltration test wells were presoaked the day of installation and testing took place within 24 hours of presoaking. During the pre-test, the water level was observed to drop less than 6 inches in 25 minutes for two consecutive readings. Therefore, the test procedure for fine-grained soils or "slow test" was followed. Test well installation and the estimation of infiltration rates were accomplished in general accordance with the guidelines set forth by the County of Orange (2013). In general, three-dimensional flow out of the test well (*percolation*), as observed in the field, is mathematically reduced to one-dimensional flow out of the bottom of the test well (*infiltration*). Infiltration tests are performed using relatively clean water, free of particulates, silt, etc. The results of our recent field infiltration testing are presented in Appendix D and summarized below.

TABLE 2

Summary of Field Infiltration Testing

Infiltration Test Identification	Approx. Depth Below Existing Grade (ft)	Observed Infiltration Rate* (in./hr.)
I-1	5	0.03
I-2	5	0.04

*Observed Infiltration Rates Do Not Include Factor of Safety.

The tested infiltration rates provided in this report are considered a general representation of the infiltration rates at the location of the proposed infiltration boring. Please note, the testing of infiltration rates is highly dependent upon the materials encountered at the point of testing (i.e., location and depth of testing). Varying subsurface conditions may exist outside of the test location which could alter the calculated infiltration rate. Please refer to Section 4.7 for subsurface water infiltration recommendations.

2.5 Seismic Design Criteria

The site seismic characteristics were evaluated per the guidelines set forth in Chapter 16, Section 1613 of the 2019 California Building Code (CBC). Since the site contains soils that are susceptible to liquefaction (refer to below Section "Liquefaction and Dynamic Settlement"), ASCE 7-16 which has been adopted by the CBC requires that site soils be assigned Site Class "F" and a site-specific response spectrum be performed. However, in accordance with Section 20.3.1 of ASCE 7-16, if the fundamental periods of vibration of the planned structure are equal to or less than 0.5 second, a site-specific response spectrum is not required and ASCE 7-16/2019 CBC site class and seismic parameters may be used in lieu of a site-specific response

spectrum. It should be noted that the seismic parameters provided herein are not applicable for any structure having a fundamental period of vibration greater than 0.5 second. **Please note that the following seismic parameters are only applicable for code-based acceleration response spectra and are not applicable for where site-specific ground motion procedures are required by ASCE 7-16.** Representative site coordinates of latitude 33.7815 degrees north and longitude -118.0510 degrees west were utilized in our analyses. The maximum considered earthquake (MCE) spectral response accelerations (S_{MS} and S_{M1}) and adjusted design spectral response acceleration parameters (S_{DS} and S_{D1}) for Site Class D are provided in Table 3 below. The structural designer should contact the geotechnical consultant if structural conditions (e.g., number of stories, seismically isolated structures, etc.) require site-specific ground motions.

TABLE 3

Seismic Design Parameters

Selected Parameters from 2019 CBC, Section 1613 - Earthquake Loads	**Seismic Design Values**	**Notes/Exceptions**
Distance to applicable faults classifies the site as a "Near-Fault" site.		Section 11.4.1 of ASCE 7
Site Class	D*	Chapter 20 of ASCE 7
Ss (Risk-Targeted Spectral Acceleration for Short Periods)	1.467g	From SEAOC, 2021
S_1 (Risk-Targeted Spectral Accelerations for 1-Second Periods)	0.524g	From SEAOC, 2021
F_a (per Table 1613.2.3(1))	1.000	For Simplified Design Procedure of Section 12.14 of ASCE 7, F_a shall be taken as 1.4 (Section 12.14.8.1)
F_v (per Table 1613.2.3(2))	1.776	Value is only applicable per requirements/exceptions per Section 11.4.8 of ASCE 7
S_{MS} for Site Class D [Note: $S_{MS} = F_aS_S$]	1.467g	-
S_{M1} for Site Class D [Note: $S_{M1} = F_vS_1$]	0.931g	Value is only applicable per requirements/exceptions per Section 11.4.8 of ASCE 7
S_{DS} for Site Class D [Note: $S_{DS} = (^2/_3)S_{MS}$]	0.978g	-
S_{D1} for Site Class D [Note: $S_{D1} = (^2/_3)S_{M1}$]	0.620g	Value is only applicable per requirements/exceptions per Section 11.4.8 of ASCE 7
C_{RS} (Mapped Risk Coefficient at 0.2 sec)	0.908	ASCE 7 Chapter 22
C_{R1} (Mapped Risk Coefficient at 1 sec)	0.913	ASCE 7 Chapter 22
*Since site soils are Site Class D and S_1 is greater than or equal to 0.2, the seismic response coefficient Cs is determined by Eq. 12.8-2 for values of $T \leq 1.5T_s$ and taken equal to 1.5 times the value calculated in accordance with either Eq. 12.8-3 for $T_L \geq T > T_s$, or Eq. 12.8-4 for $T > T_L$. Refer to ASCE 7-16.		

Section 1803.5.12 of the 2019 CBC (per Section 11.8.3 of ASCE 7) states that the maximum considered earthquake geometric mean (MCE_G) Peak Ground Acceleration (PGA) should be used for liquefaction potential. The PGA_M for the site is equal to 0.696g (SEAOC, 2021).

A deaggregation of the PGA based on a 2,475-year average return period indicates that an earthquake magnitude of 6.8 at a distance of approximately 10.6 km from the site would contribute the most to this ground motion (USGS, 2014).

2.6 Faulting

Prompted by damaging earthquakes in Northern and Southern California, State legislation and policies concerning the classification and land-use criteria associated with faults have been developed. Their purpose was to prevent the construction of urban developments across the trace of active faults, resulting in the Alquist-Priolo Earthquake Fault Zoning Act. Earthquake Fault Zones have been delineated along the traces of active faults within California. Where developments for human occupation are proposed within these zones, the state requires detailed fault evaluations be performed so that engineering geologists can mitigate the hazards associated with active faulting by identifying the location of active faults and allowing for a setback from the zone of previous ground rupture.

The subject site is not located within a State of California Earthquake Fault Zone (Alquist-Priolo) and no faults were identified on the site during our site evaluation (CGS, 2018). The possibility of damage due to ground rupture is considered low since no active faults are known to cross the site. The closest known active faults to the subject site are the Newport-Inglewood, Puente Hills, Palos Verdes and Elsinore Fault Zones (USGS 2016).

Secondary effects of seismic shaking resulting from large earthquakes on the major faults in the Southern California region, which may affect the site, include ground lurching and shallow ground rupture, soil liquefaction, and dynamic settlement. These secondary effects of seismic shaking are a possibility throughout the Southern California region and are dependent on the distance between the site and causative fault and the onsite geology. A discussion of these secondary effects is provided in the following sections.

2.6.1 Liquefaction and Dynamic Settlement

Liquefaction is a seismic phenomenon in which loose, saturated, granular soils behave similarly to a fluid when subject to high-intensity ground shaking. Liquefaction occurs when three general conditions coexist: 1) shallow groundwater; 2) low density non-cohesive (granular) soils; and 3) high-intensity ground motion. Studies indicate that saturated, loose near-surface cohesionless soils exhibit the highest liquefaction potential, while dry, dense, cohesionless soils and cohesive soils exhibit low to negligible liquefaction potential. In general, cohesive soils are not considered susceptible to liquefaction, depending on their plasticity and moisture content (Bray & Sancio, 2006). Effects of liquefaction on level ground include settlement, sand boils, and bearing capacity failures below structures. Dynamic settlement of dry loose sands can occur as the sand particles tend to settle and densify as a result of a seismic event.

Based on our review of the State of California Seismic Hazard Zone for liquefaction potential (CDMG, 1999), the site is located within a liquefaction hazard zone. Subsurface field data indicates that the site contains isolated sandy layers susceptible to liquefaction interfingered with fine-grained non-liquefiable soils and dense sands. The recent explored groundwater elevation of 11 feet below existing grade and historic high groundwater elevation of 10 feet below existing grade were both used in the liquefaction analysis. Liquefaction potential was evaluated using the procedures outlined by Special Publication 117A (SCEC, 1999 & CGS, 2008) and the applicable seismic criteria (e.g., 2019 CBC). Liquefaction induced settlement was estimated using the PGA_M per the 2019 CBC and a moment magnitude of 6.80 (USGS, 2014).

Results indicate total seismic settlement on the order of 2 inches. Differential seismic settlement can be estimated as half of the total estimated seismic settlement over a horizontal span of about 40 feet. This can be mitigated using a post-tensioned slab and interconnecting isolated pad footings with grade beams.

2.6.2 Liquefaction Surface Effects

Liquefaction induced surface effects, such as sand boils, can occur when shallow liquefiable soil layers trigger during a seismic event and are not contained deep enough below a non-liquefiable cap (i.e., non-liquefiable soils such as artificial fill or fine-grained soil). Based on analysis of the subsurface data, surface effects due to liquefaction are not anticipated to significantly affect the proposed surface improvements.

2.6.3 Lateral Spreading

Lateral spreading is a type of liquefaction-induced ground failure associated with the lateral displacement of surficial blocks of sediment resulting from liquefaction in a subsurface layer. Once liquefaction transforms the subsurface layer into a fluid mass, gravity plus the earthquake inertial forces may cause the mass to move downslope towards a free face (such as a river channel or an embankment). Lateral spreading may cause large horizontal displacements and such movement typically damages pipelines, utilities, bridges, and structures.

Due to the lack of a nearby "free face" condition and non-continuous nature of the subsurface layers, the potential for lateral spreading is considered very low.

2.7 Static Settlement

Although no grading plans were available during the preparation of this report, the subject site is sensitive to static settlement and grade changes. Static settlement would be induced by raising the planned grades and subjecting the new grades to building loads. Moderate increases in grades up to approximately 2 to 3 feet are estimated at this time.

The underlying soils were found to be generally stiff to very stiff silts and clays. Based on laboratory test data consisting of in-situ moisture content, consolidation tests, and blow counts,

fine-grained soils are considered generally normally consolidated. Based upon in-situ testing, visual examination, lab data, geotechnical evaluation and the proposed corrective grading and fill placement recommendations, static settlement induced by raising grades 1 to 3 feet is estimated to be on the order of 1-inch. LGC Geotechnical should be provided with the grading plans to for review to confirm or modify the recommendations for static settlement.

2.8 Expansion Potential

Based on the results of our laboratory testing, site soils are anticipated to have a "Low" expansion potential. Final expansion potential of site soils should be determined at the completion of grading. Results of expansion testing at finish grades will be utilized to confirm final foundation design.

3.0 CONCLUSIONS

Based on the results of our geotechnical evaluation, it is our opinion that the proposed development is feasible from a geotechnical standpoint, provided the following conclusions and recommendations are implemented.

The following is a summary of the primary geotechnical factors that may affect future development of the site:

- In general, our borings indicate the site is underlain by young alluvial fan deposits to the maximum explored depth of approximately 46.5 feet below existing grade. The material consists of clay, clayey sand, silty clay, and silty sand. The material was observed to be very moist to wet with depth and soft to stiff and medium dense to dense.
- Groundwater was encountered during our subsurface evaluation at depths of approximately 11 to 13 feet below existing grade. Historic high groundwater is estimated to be about 10 feet below existing grade (CDMG, 1998).
- The subject site is not located within a State of California Earthquake Fault Zone (Alquist-Priolo). The main seismic hazard that may affect the site is ground shaking from one of the active regional faults. The subject site will likely experience strong seismic ground shaking during its design life.
- Site soils are considered susceptible to liquefaction. The site is located in a State of California Seismic Hazard Zone for liquefaction (CDMG, 1999). Total seismic settlement is estimated to be on the order of 2.0 inches. Differential seismic settlement can be estimated at half of the total seismic settlement over a horizontal span of 40 feet for design of foundations.
- Based on the results of preliminary laboratory testing, site soils are anticipated to have "Low" expansion potential. Mitigation measures are required for foundations and site improvements like concrete flatwork to minimize the impacts of expansive site soils. Final design expansion potential must be determined at the completion of grading.
- Pre-soaking of the subgrade for building slabs will be required due to site expansive soils. The duration of this process varies greatly based on the chosen method and is also dependent on factors such as soil type and weather conditions. Time duration for presoaking from completion of rough grading to trenching of foundations should be accounted for in the construction schedule (typically 1 to 2 weeks).
- From a geotechnical perspective, the existing onsite soils are suitable material for use as general fill (not retaining wall backfill), provided that they are relatively free from rocks (larger than 8 inches in maximum dimension), construction debris, and significant organic material.
- The site contains soils that are not suitable for retaining wall backfill due to their fines content and expansion potential, therefore import of sandy soils will be required by the contractor for obtaining suitable backfill soil for planned site retaining walls.
- Excavations into the existing site soils should be feasible with heavy construction equipment in good working order.
- Due to the relatively shallow site groundwater (about 11 feet below existing ground surface) and soils above the groundwater table with high moisture contents, dewatering or stabilization of subgrade for removal bottoms or deep utility trenches may be locally required, prior to subsequent fill placement.

4.0 PRELIMINARY RECOMMENDATIONS

The following recommendations are to be considered preliminary and should be confirmed upon completion of grading and earthwork operations. In addition, they should be considered minimal from a geotechnical viewpoint, as there may be more restrictive requirements from the architect, structural engineer, building codes, governing agencies, or the owner.

It should be noted that the following geotechnical recommendations are intended to provide sufficient information to develop the site in general accordance with the 2019 CBC requirements. With regard to the potential occurrence of potentially catastrophic geotechnical hazards such as fault rupture, earthquake-induced landslides, liquefaction, etc. the following geotechnical recommendations should provide adequate protection for the proposed development to the extent required to reduce seismic risk to an "acceptable level." The "acceptable level" of risk is defined by the California Code of Regulations as "that level that provides reasonable protection of the public safety, though it does not necessarily ensure continued structural integrity and functionality of the project" [Section 3721(a)]. Therefore, repair and remedial work of the proposed improvements may be required after a significant seismic event. With regards to the potential for less significant geologic hazards to the proposed development, the recommendations contained herein are intended as a reasonable protection against the potential damaging effects of geotechnical phenomena such as expansive soils, fill settlement, groundwater seepage, etc. It should be understood, however, that although our recommendations are intended to maintain the structural integrity of the proposed development and structures given the site geotechnical conditions, they cannot preclude the potential for some cosmetic distress or nuisance issues to develop as a result of the site geotechnical conditions.

The geotechnical recommendations contained herein must be confirmed to be suitable or modified based on the actual as-graded conditions.

4.1 Site Earthwork

We anticipate that earthwork at the site will consist of demolition of the existing site improvements, required earthwork removals, subgrade preparation, precise grading and construction of the proposed new improvements, including the residential structures, neighborhood amenities, subsurface utilities, interior streets, etc.

We recommend that earthwork onsite be performed in accordance with the following recommendations, future grading plan review report(s), the 2019 CBC/City of Los Alamitos grading requirements, and the General Earthwork and Grading Specifications included in Appendix E. In case of conflict, the following recommendations shall supersede those included in Appendix E. The following recommendations should be considered preliminary and may be revised based upon future evaluation and review of the project plans and/or based on the actual conditions encountered during site grading/construction.

4.1.1 Site Preparation

Prior to grading of areas to receive structural fill or engineered improvements, the areas should be cleared of existing building structures, asphalt, surface obstructions, and

demolition debris. Vegetation and debris should be removed and properly disposed of off-site. Holes resulting from the removal of buried obstructions, which extend below proposed finish grades, should be replaced with suitable compacted fill material. Any abandoned sewer or storm drain lines should be completely removed and replaced with properly placed compacted fill. Deeper demolition may be required in order to remove existing foundations. We recommend the trenches associated with demolition which extend below the remedial grading depth of 5 feet be backfilled and properly compacted prior to the demolition contractor leaving the site.

If cesspools or septic systems are encountered, they should be removed in their entirety. The resulting excavation should be backfilled with properly compacted fill soils. As an alternative, cesspools can be backfilled with lean sand-cement slurry. Any encountered wells should be properly abandoned in accordance with regulatory requirements. At the conclusion of the clearing operations, a representative of LGC Geotechnical should observe and accept the site prior to further grading.

4.1.2 Removal and Recompaction Depths and Limits

In order to provide a relatively uniform bearing condition for the planned residential building pads and improvements, we recommend the site soils be removed and recompacted according to the criteria outlined below.

Building Pads: We recommend that soils within building pads be removed and recompacted to a minimum depth of 5 feet below existing grade or 3 feet below the base of the foundations, whichever is deeper. Where space is available, the envelope for removal and recompaction should extend laterally a minimum distance equal to the depth of removal and recompaction below finish grade or 5 feet beyond the edges of the proposed building improvements, whichever is larger.

Minor Site Structures: For minor site structures such as free-standing walls, retaining walls, etc., removal and recompaction should extend at least 3 feet below existing grade or 2 feet below the base of foundations, whichever is deeper. Where space is available, the envelope for removal and recompaction should extend laterally a minimum distance of 3 feet beyond the edges of the proposed minor site structure improvements.

Pavement and Hardscape: Within pavement and hardscape areas, removal and recompaction should extend to a depth of at least 2 feet below the existing grade or 1-foot below finished subgrade (i.e., below planned aggregate base/asphalt concrete), whichever is deeper. In general, the envelope for removal and recompaction should extend laterally a minimum distance of 2 feet beyond the edges of the proposed pavement and hardscape improvements.

Based on our findings, the recommended removal and recompaction depths may extend to a depth in the proximity of the anticipated groundwater table and through clayey soils with high moisture contents. Care should be taken in order to avoid creating an unstable removal bottom during grading. Recommendations for subgrade stabilization are included in Section 4.1.4.

Local conditions may be encountered during excavation that could require additional over-excavation beyond the above noted minimum in order to obtain an acceptable subgrade. The actual depths and lateral extents of grading will be determined by the geotechnical consultant, based on subsurface conditions encountered during grading. Removal areas and areas to be over-excavated should be accurately staked in the field by the Project Surveyor.

4.1.3 Temporary Excavations

Temporary excavations should be performed in accordance with project plans, specifications, and all Occupational Safety and Health Administration (OSHA) requirements. Excavations should be laid back or shored in accordance with OSHA requirements before personnel or equipment are allowed to enter. Based on our field investigation, the majority of site soils are anticipated to be OSHA Type "B" soils (refer to the attached boring logs). Minor amounts of sandy soils are present and should be considered susceptible to caving. Soil conditions should be regularly evaluated during construction to verify conditions are as anticipated. The contractor shall be responsible for providing the "competent person" required by OSHA standards to evaluate soil conditions. Close coordination with the geotechnical consultant should be maintained to facilitate construction while providing safe excavations. Excavation safety is the sole responsibility of the contractor.

Vehicular traffic, stockpiles, and equipment storage should be set back from the perimeter of excavations a minimum distance equivalent to a 1:1 projection from the bottom of the excavation or 5 feet, whichever is greater, unless the cut is shored and designed for applicable surcharge load. Once an excavation has been initiated, it should be backfilled as soon as practical. Prolonged exposure of temporary excavations may result in some localized instability. Excavations should be planned so that they are not initiated without sufficient time to shore/fill them prior to weekends, holidays, or forecasted rain.

It should be noted that any excavation that extends below a 1:1 (horizontal to vertical) projection of an existing foundation will remove existing support of the structure foundation. If requested, temporary shoring parameters will be provided.

4.1.4 Removal Bottoms and Subgrade Preparation

In general, removal bottoms, over-excavation bottoms and areas to receive compacted fill should be scarified to a minimum depth of 6 inches, brought to a near-optimum moisture condition (generally within optimum and 2 percent above optimum moisture content), and re-compacted per project recommendations.

Based on the presence of shallow groundwater, shallow soils with very high moisture contents, and the potential to encounter very moist/wet alluvial materials near/at the estimated removal bottoms and deep utility trenches, some of the removal bottoms are anticipated to be wet and unstable. Pumping subgrade is possible. We recommend all wet/unstable removal bottoms and pumping subgrade be stabilized by the placement

and "working in" of 1 to 3-inch nominal diameter crushed aggregate or an approved alternate stabilization method. Based on our experience with similar projects, we anticipate the thickness of crushed rock (stabilization aggregate) needed to stabilize the removal bottoms will be on the order to 6 to 18 inches thick. The actual thickness of aggregate required to stabilize the excavation bottom shall be determined in the field based on the actual conditions and equipment used. It should be anticipated that the first lift of crushed aggregate will be worked into the pumping subgrade. Subsequent lifts should be properly compacted and will help bridge the pumping conditions. Thickness of required aggregate stabilization may be reduced by placing a layer of biaxial geogrid reinforcement (e.g., Tensar TX140 or acceptable equivalent) directly on the subgrade prior to aggregate base placement. The contractor may have to minimize construction traffic on the removal bottom to reduce disturbance. Soft and yielding subgrade should be evaluated on a case-by-case basis during earthwork operations.

Removal bottoms, over-excavation bottoms and areas to receive fill should be observed and accepted by the geotechnical consultant prior to subsequent fill placement. Soil subgrade for planned footings and improvements (e.g., slabs, etc.) should be firm and competent.

4.1.5 Material for Fill

From a geotechnical perspective, the onsite soils are generally considered suitable for use as general compacted fill, provided they are screened of organic materials, construction debris and oversized material (8 inches in greatest dimension).

From a geotechnical viewpoint, any required import soils for general fill (i.e., non-retaining wall backfill) should consist of soils of "Very Low" to "Low" expansion potential (expansion index 50 or less based on American Society for Testing and Materials [ASTM] D 4829), and free of organic materials, construction debris and any material greater than 3 inches in maximum dimension. Import for any required retaining wall backfill should meet the criteria outlined in the following paragraph. Source samples should be provided to the geotechnical consultant for laboratory testing a minimum of four working days prior to any planned importation.

The onsite soils are not suitable for retaining wall backfill due to their fines content and expansion index; therefore, import of soils will be required by the contractor for obtaining suitable retaining wall backfill soil. These preliminary findings will be confirmed during grading. Retaining wall backfill should consist of imported sandy soils with a maximum of 35 percent fines (passing the No. 200 sieve) per ASTM Test Method D1140 (or ASTM D6913/D422) and a "Very Low" expansion potential (EI of 20 or less per ASTM D4829). Soils should also be screened of organic materials, construction debris, and any material greater than 3 inches in maximum dimension.

Aggregate base (crushed aggregate base or crushed miscellaneous base) should conform to the requirements of Section 200-2 of the most recent version of the Standard Specifications for Public Works Construction ("Greenbook") for untreated base materials (except processed miscellaneous base) and/or City of Los Alamitos requirements.

The placement of demolition materials in compacted fill is acceptable from a geotechnical viewpoint provided the demolition material is broken up into pieces not larger than typically used for aggregate base (approximately 1-inch in maximum dimension) and well blended into fill soils with essentially no resulting voids. Demolition material placed in fills must be free of construction debris (wood, organics, etc.) and reinforcing steel. If asphalt concrete fragments will be incorporated into the demolition materials, approval from an environmental viewpoint may be required and is not the purview of the geotechnical consultant. From our previous experience, we recommend that asphalt concrete fragments be limited to fill areas within planned street areas (i.e., not within building pad areas).

4.1.6 Placement and Compaction of Fills

Material to be placed as fill should be brought to near-optimum moisture content (generally within optimum and 2 percent above optimum moisture content) and recompacted to at least 90 percent relative compaction (per ASTM D1557). Moisture conditioning of site soils will be required in order to achieve adequate compaction. Significant drying and or mixing of very moist soils will be required prior to reusing the materials in compacted fills.

The optimum lift thickness to produce a uniformly compacted fill will depend on the type and size of compaction equipment used. In general, fill should be placed in uniform lifts not exceeding 8 inches in compacted thickness. Each lift should be thoroughly compacted and accepted prior to subsequent lifts. Generally, placement and compaction of fill should be performed in accordance with local grading ordinances and with observation and testing performed by the geotechnical consultant. Oversized material as previously defined should be removed from site fills.

During backfill of excavations, the fill should be properly benched into firm and competent soils of temporary backcut slopes as it is placed in lifts.

Aggregate base material should be compacted to at least 95 percent relative compaction at or slightly above optimum moisture content per ASTM D1557. Subgrade below aggregate base should be compacted to at least 90 percent relative compaction per ASTM D1557 at near-optimum moisture content (generally within optimum and 2 percent above optimum moisture content).
If gap-graded ¾-inch rock is used for backfill (around storm drain storage chambers, retaining wall backfill, etc.) it will require compaction. Rock shall be placed in thin lifts (typically not exceeding 6 inches) and mechanically compacted with observation by geotechnical consultant. Backfill rock shall meet the requirements of ASTM D2321. Gap-graded rock is required to be wrapped in filter fabric (Mirafi 140N or approved alternative) to prevent the migration of fines into the rock backfill.

4.1.7 Trench and Retaining Wall Backfill and Compaction

The onsite soils may generally be suitable as trench backfill, provided the soils are screened of rocks and other material greater than 6 inches in diameter and organic

matter. If trenches are shallow or the use of conventional equipment may result in damage to the utilities, sand having a sand equivalent (SE) of 30 or greater (per California Test Method [CTM] 217) may be used to bed and shade the pipes. Based on our field evaluation, onsite soils will not meet this sand equivalent requirement. Sand backfill within the pipe bedding zone may be densified by jetting or flooding and then tamping to ensure adequate compaction. Subsequent trench backfill should be compacted in uniform thin lifts by mechanical means to at least the recommended minimum relative compaction (per ASTM D1557).

Retaining wall backfill should consist of sandy soils as outlined in preceding Section 4.1.5. The limits of select sandy backfill should extend at minimum ½ the height of the retaining wall or the width of the heel (if applicable), whichever is greater (Figure 3). Retaining wall backfill soils should be compacted in relatively uniform thin lifts to at least 90 percent relative compaction (per ASTM D1557). Jetting or flooding of retaining wall backfill materials should not be permitted.

In backfill areas where mechanical compaction of soil backfill is impractical due to space constraints, typically sand-cement slurry may be substituted for compacted backfill. The slurry should contain about one sack of cement per cubic yard. When set, such a mix typically has the consistency of compacted soil. Sand cement slurry placed near the surface within landscape areas should be evaluated for potential impacts on planned improvements.

A representative from LGC Geotechnical should observe, probe, and test the backfill to verify compliance with the project recommendations.

4.1.8 Shrinkage and Subsidence

Allowance in the earthwork volumes budget should be made for an estimated 5 to 15 percent reduction in volume of near-surface (upper approximate 5 feet) soils. It should be stressed that these values are only estimates and that an actual shrinkage factor would be extremely difficult to predetermine. Subsidence, due to earthwork operations, is expected to be on the order of 0.1 feet. These values are estimates only and exclude losses due to removal of any vegetation or debris. The effective shrinkage of onsite soils will depend primarily on the type of compaction equipment and method of compaction used onsite by the contractor and accuracy of the topographic survey.

4.2 Preliminary Foundation Recommendations

Provided that the remedial grading recommendations provided herein are implemented, the site may be considered suitable for the support of the residential structures using a post-tensioned foundation system designed to resist the impacts of expansive soils and liquefaction induced differential settlement. Due to seismic settlement potential, we recommend isolated pad footings be interconnected with grade beams. The foundations designer should verify the foundation can accommodate the estimated settlement and differential settlement.

Site soils are anticipated to be "Low" expansion potential (EI of 50 or less per ASTM D4829) and special design considerations from a geotechnical perspective are required. Please note that the following foundation recommendations are preliminary and must be confirmed by LGC Geotechnical at the completion of grading. Recommended soil bearing and estimated settlement due to structural loads are provided in Section 4.3.

4.2.1 Provisional Post-Tensioned Foundation Design Parameters

The geotechnical parameters provided herein may be used for post-tensioned slab foundations. These parameters have been determined in general accordance with the Post-Tensioning Institute (PTI, 2012) Standard Requirements (PTI DC 10.5), referenced in Chapter 18 of the 2019 CBC. In utilizing these parameters, the foundation engineer should design the foundation system in accordance with the allowable deflection criteria of applicable codes and the requirements of the structural designer/architect. Other types of stiff slabs may be used in place of the CBC post-tensioned slab design provided that, in the opinion of the foundation structural designer, the alternative type of slab is at least as stiff and strong as that designed by the CBC/PTI method to resist expansive soils.

Our design parameters are based on our experience with similar residential projects and the anticipated nature of the soil (with respect to expansion potential). Please note that implementation of our recommendations will not eliminate foundation movement (and related distress) should the moisture content of the subgrade soils fluctuate. It is the intent of these recommendations to help maintain the integrity of the proposed structures and reduce (not eliminate) movement, based upon the anticipated site soil conditions. Should future owners not properly maintain the areas surrounding the foundation, for example by overwatering, then we anticipate for highly expansive soils the maximum differential movement of the perimeter of the foundation to the center of the foundation to be on the order of a couple of inches. Soils of lower expansion potential are anticipated to show less movement.

TABLE 4

Provisional Geotechnical Parameters for Post-Tensioned Foundation Slab Design

Parameter	PT Slab with Perimeter Footing	PT Mat with Thickened Edge
Expansion Index	Low[1]	Low[1]
Thornthwaite Moisture Index	-20	-20
Constant Soil Suction	PF 3.9	PF 3.9
Center Lift Edge moisture variation distance, e_m Center lift, y_m	 9.0 feet 0.35 inch	 9.0 feet 0.45 inch
Edge Lift Edge moisture variation distance, e_m Edge lift, y_m	 5.0 feet 0.75 inch	 5.0 feet 0.85 inch
Modulus of Subgrade Reaction, k (assuming presoaking as indicated below)	200 pci	200 pci
Minimum perimeter footing/thickened edge embedment below finish grade	12 inches	6 inches
Perimeter foundation reinforcement	N/A[2]	N/A[2]
Presoak (moisture conditioning)	100% optimum to depth of 12 inches	100% optimum to depth of 12 inches

1. Assumed for preliminary design purposes. Further evaluation is needed at the completion of grading. PT slab parameters are based on expansive soil conditions as well as seismic settlement findings.
2. Recommendations for foundation reinforcement and slab thickness are ultimately the purview of the foundation engineer/structural engineer based upon geotechnical criteria and structural engineering considerations.
3. Recommendations for sand below slabs have traditionally been included with geotechnical foundation recommendations, although they are not the purview of the geotechnical consultant. The sand layer requirements are the purview of the foundation engineer/structural engineer and should be provided in accordance with ACI Publication 302 "Guide for Concrete Floor and Slab Construction".
4. Recommendations for vapor retarders below slabs are also the purview of the foundation engineer/structural engineer and should be provided in accordance with applicable code requirements.

4.2.2 Post-Tensioned Foundation Subgrade Preparation and Maintenance

Moisture conditioning (presoaking) of the subgrade soils is recommended prior to trenching the foundation. The duration of this process varies greatly based on the chosen method and is also dependent on factors such as soil type and weather conditions. Time duration for presoaking from completion of rough grading to trenching of foundations should be accounted for in the construction schedule (typically 1 to 2 weeks). The recommendations specific to the anticipated site soil conditions, including recommended presoak, are presented in Table 4. The subgrade moisture

condition of the building pad soils should be maintained at near-optimum moisture content up to the time of concrete placement. This moisture content should be maintained around the immediate perimeter of the slab during construction and up to occupancy of the homes.

The geotechnical parameters provided herein assume that if the areas adjacent to the foundation are planted and irrigated, these areas will be designed with proper drainage and adequately maintained so that ponding, which causes significant moisture changes below the foundation, does not occur. Our recommendations do not account for excessive irrigation and/or incorrect landscape design. Plants should only be provided with sufficient irrigation for life and not overwatered to saturate subgrade soils. Sunken planters placed adjacent to the foundation, should either be designed with an efficient drainage system or liners to prevent moisture infiltration below the foundation. Some lifting of the perimeter foundation beam should be expected even with properly constructed planters.

In addition to the factors mentioned above, future homeowners should be made aware of the potential negative influences of trees and/or other large vegetation. Roots that extend near the vicinity of foundations can cause distress to foundations. Future homeowners (and the owner's landscape architect) should not plant trees/large shrubs closer to the foundations than a distance equal to half the mature height of the tree or 20 feet, whichever is more conservative unless specifically provided with root barriers to prevent root growth below the house foundation.

It is the homeowner's responsibility to perform periodic maintenance during hot and dry periods to ensure that adequate watering has been provided to keep soils from separating or pulling back from the foundation. Future homeowners should be informed and educated regarding the importance of maintaining a constant level of soil-moisture. The homeowners should be made aware of the potential negative consequences of both excessive watering, as well as allowing potentially expansive soils to become too dry. Expansive soils can undergo shrinkage during drying and swelling during the rainy winter season or when irrigation is resumed. This can result in distress to building structures and hardscape improvements. The builder should provide these recommendations to future homeowners.

4.2.3 Slab Underlayment Guidelines

The following is for informational purposes only since slab underlayment (e.g., moisture retarder, sand or gravel layers for concrete curing and/or capillary break) is unrelated to the geotechnical performance of the foundation and thereby not the purview of the geotechnical consultant. Post-construction moisture migration should be expected below the foundation. The foundation engineer/architect should determine whether the use of a capillary break (sand or gravel layer), in conjunction with the vapor retarder, is necessary or required by code. Sand layer thickness and location (above and/or below vapor retarder) should also be determined by the foundation engineer/architect.

4.3 Soil Bearing and Lateral Resistance

Provided our earthwork recommendations are implemented, an allowable soil bearing pressure of 1,500 pounds per square foot (psf) may be used for the design of footings having a minimum width of 12 inches and minimum embedment of 12 inches below lowest adjacent ground surface. This value may be increased by 300 psf for each additional foot of embedment and 150 psf for each additional foot of foundation width to a maximum value of 2,500 psf. A post-tensioned mat foundation a minimum of 6 inches below lowest adjacent grade may be designed for an allowable soil bearing pressure of 1,200 psf. These allowable bearing pressures are applicable for level (ground slope equal to or flatter than 5H:1V) conditions only. Bearing values indicated are for total dead loads and frequently applied live loads and may be increased by ⅓ for short duration loading (i.e., wind or seismic loads).

In utilizing the above-mentioned allowable bearing capacity and provided our earthwork recommendations are implemented, foundation settlement due to consolidation and structural loads is anticipated to be less than 2 inches. Differential static settlement may be taken as half of the total settlement (i.e., 1-inch over a horizontal span of 40 feet due to structural loads). Seismically induced settlement is discussed in Section 2.6.1.

Resistance to lateral loads can be provided by friction acting at the base of foundations and by passive earth pressure. For concrete/soil frictional resistance, an allowable coefficient of friction of 0.25 may be assumed with dead-load forces. For slabs constructed over a moisture retarder, the allowable friction coefficient should be provided by the manufacturer. An allowable passive lateral earth pressure of 200 psf per foot of depth (or pcf) to a maximum of 2,000 psf may be used for the sides of footings poured against properly compacted fill. Allowable passive pressure may be increased to 270 pcf (maximum of 2,700 psf) for short duration seismic loading. This passive pressure is applicable for level (ground slope equal to or flatter than 5H:1V) conditions. Frictional resistance and passive pressure may be used in combination without reduction. We recommend that the upper foot of passive resistance be neglected if finished grade will not be covered with concrete or asphalt. The provided allowable passive pressures are based on a factor of safety of 1.5 and 1.1 for static and seismic loading conditions, respectively.

4.4 Lateral Earth Pressures for Retaining Walls

The following may be used for design of site retaining walls. Lateral earth pressures are provided as equivalent fluid unit weights, in psf per foot of depth (or pcf). These values do not contain an appreciable factor of safety, so the retaining wall designer should apply the applicable factors of safety and/or load factors during design. A soil unit weight of 120 pcf may be assumed for calculating the actual weight of soil over the wall footing.

The following lateral earth pressures are presented in Table 5 for approved imported granular soils with a maximum of 35 percent fines (passing the No. 200 sieve per ASTM D-421/422) and a "Very Low" expansion potential (EI of 20 or less per ASTM D4829). The onsite soils are not suitable for retaining wall backfill due to their fines content and expansion potential. Therefore, import of sandy soils meeting the criteria outlined above will be required by the contractor for obtaining suitable retaining wall backfill soil.

The wall designer should clearly indicate on the retaining wall plans the required select sandy soil backfill criteria. These preliminary findings should be confirmed during grading.

TABLE 5

Lateral Earth Pressures – Imported Sandy Soils

Conditions	Equivalent Fluid Unit Weight (pcf)	Equivalent Fluid Unit Weight (pcf)
	Level Backfill	2:1 Sloped Backfill
	Approved Sandy Soils (Import)	Approved Sandy Soils (Import)
Active	35	55
At-Rest	55	70

If the wall can yield enough to mobilize the full shear strength of the soil, it can be designed for "active" pressure. If the wall cannot yield under the applied load, the earth pressure will be higher. This would include 90-degree corners of retaining walls. Such walls should be designed for "at-rest." The equivalent fluid pressure values assume free-draining conditions. If conditions other than those assumed above are anticipated, the equivalent fluid pressure values should be provided on an individual-case basis by the geotechnical engineer.

Retaining wall structures should be provided with appropriate drainage and appropriately waterproofed. To reduce, but not eliminate, saturation of near-surface (upper approximate 1-foot) soils in front of the retaining walls, the perforated subdrain pipe should be located as low as possible behind the retaining wall. The outlet pipe should be sloped to drain to a suitable outlet. In general, we do not recommend retaining wall outlet pipes be connected to area drains. If subdrains are connected to area drains, special care and information should be provided to homeowners to maintain these drains. Typical retaining wall drainage is illustrated in Figure 3. It should be noted that the recommended subdrain does not provide protection against seepage through the face of the wall and/or efflorescence. Efflorescence is generally a white crystalline powder (discoloration) that results when water containing soluble salts migrates over a period of time through the face of a retaining wall and evaporates. If such seepage or efflorescence is undesirable, retaining walls should be waterproofed to reduce this potential. Waterproofing and outlet systems are not the purview of the geotechnical consultant.

Surcharge loading effects from any adjacent structures should be evaluated by the retaining wall designer. In general, structural loads within a 1:1 (horizontal: vertical) upward projection from the bottom of the proposed retaining wall footing will surcharge the proposed retaining wall. In addition to the recommended earth pressure, retaining walls adjacent to streets should be designed to resist a uniform lateral pressure of 85 pounds per square foot (psf) due to normal street vehicle traffic, if applicable. Uniform lateral surcharges may be estimated using the applicable coefficient of lateral earth pressure using a rectangular distribution. A factor of 0.45 and 0.3 may be used for at-rest and active conditions, respectively. The retaining wall designer should contact the geotechnical consultant for any required geotechnical input in

estimating surcharge loads.

If a retaining wall greater than 6 feet in height is proposed, the retaining wall designer should contact the geotechnical engineer for specific seismic lateral earth pressure increments based on the configuration of the planned retaining wall structures.

Soil bearing and lateral resistance (friction coefficient and passive resistance) are provided in Section 4.3. Earthwork considerations (temporary backcuts, backfill, compaction, etc.) for retaining walls are provided in Section 4.1 (Site Earthwork) and the subsequent earthwork related sub-sections.

4.5 Soil Corrosivity

Although not corrosion engineers (LGC Geotechnical is not a corrosion consultant), several governing agencies in Southern California require the geotechnical consultant to determine the corrosion potential of soils to buried concrete and metal facilities. We therefore present the results of our testing with regard to corrosion for the use of the client and other consultants, as they determine necessary.

Corrosion testing of a near-surface bulk sample indicated a soluble sulfate content ranging from approximately 0.032 to 0.254 percent, a chloride content ranging from 140 to 600 parts per million (ppm), pH of 8.92, and a minimum resistivity of 210 ohm-centimeters. Based on Caltrans Corrosion Guidelines (Caltrans, 2021), soils are considered corrosive to structural elements if the pH is 5.5 or less, or the chloride concentration is 500 ppm or greater, or the sulfate concentration is 2,000 ppm (0.2 percent) or greater. Based on the preliminary test results, soils are considered corrosive using Caltrans criteria.

Based on preliminary laboratory sulfate test results, the near surface soils are designated to a class "S2" per ACI 318, Table 19.3.1.1 with respect to sulfates. Concrete in direct contact with the onsite soils can be designed according to ACI 318, Table 19.3.2.1 using the "S2" sulfate classification.

Laboratory testing may need to be performed at the completion of grading by the project corrosion engineer to further evaluate the as-graded soil corrosivity characteristics. Accordingly, revision of the corrosion potential may be needed, should future test results differ substantially from the conditions reported herein. The client and/or other members of the development team should consider this during the design and planning phase of the project and formulate an appropriate course of action.

4.6 Control of Surface Water and Drainage Control

From a geotechnical perspective, we recommend that compacted finished grade soils adjacent to proposed residences be sloped away from the proposed residence and towards an approved drainage device or unobstructed swale. Drainage swales, wherever feasible, should not be constructed within 5 feet of buildings. Where lot and building geometry necessitates that the side yard drainage swales be routed closer than 5 feet to structural foundations, we recommend the use of area drains together with drainage swales. Drainage swales used in

conjunction with area drains should be designed by the project civil engineer so that a properly constructed and maintained system will prevent ponding within 5 feet of the foundation. Code compliance of grades is not the purview of the geotechnical consultant.

Planters with open bottoms adjacent to buildings should be avoided. Planters should not be designed adjacent to buildings unless provisions for drainage, such as catch basins, liners, and/or area drains, are made. Overwatering must be avoided.

4.7 Subsurface Water Infiltration

Recent regulatory changes in some jurisdictions have recommended that low flow runoff be infiltrated rather than discharged via conventional storm drainage systems. Typically, a combination of methods is implemented to reduce surface water runoff and increase infiltration including; permeable pavements/pavers for roadways and walkways and directing surface water runoff to grass-lined swales, retention areas, and/or drywells. It should be noted that intentionally infiltrating storm water conflicts with the geotechnical engineering objective of directing surface water away from structures and improvements. The geotechnical stability and integrity of the project site is reliant upon appropriately handling all surface water. In general, the vast majority of geotechnical distress issues are directly related to improper drainage. In general, distress in the form of movement of improvements could occur as a result of soil saturation and loss of soil support, expansion, internal soil erosion, collapse and/or settlement. Infiltrated water may enter underground utility pipe zones and migrate along the pipe backfill, potentially impacting other improvements located far away from the point of infiltration.

Geotechnical stability and integrity of the project site is reliant upon appropriate handling of surface water. Due to the extremely low measured infiltration rate, low permeability fine-grained soils at depth, shallow groundwater and site liquefaction potential, we strongly recommend against the intentional infiltration of storm water into subsurface soils.

4.8 Preliminary Asphalt Concrete Pavement Sections

The following provisional minimum asphalt concrete (AC) street sections are provided in Table 6 for Traffic Indices (TI) of 5.0, 5.5 and 6.0. These sections are based on an assumed R-value of 10. These recommendations must be confirmed with R-value testing of representative near-surface soils at the completion of grading and after underground utilities have been installed and backfilled. Final pavement sections should be confirmed by the project civil engineer based upon the final design Traffic Index. If requested, LGC Geotechnical will provide sections for alternate TI values. Should the City of Los Alamitos have more stringent requirements, updated pavement recommendation can be provided.

TABLE 6

Preliminary Pavement Section Options

Assumed Traffic Index	5.0	5.5	6.0
R -Value Subgrade	10	10	10
AC Thickness	4.0 inches	4.0 inches	5.0 inches
Aggregate Base Thickness	7.0 inches	9.0 inches	9.0 inches

The pavement section thicknesses provided above are considered minimum thicknesses. Increasing the thickness of any or all of the above layers will reduce the likelihood of the pavement experiencing distress during its service life. The above recommendations are based on the assumption that proper maintenance and irrigation of the areas adjacent to the roadway will occur throughout the design life of the pavement. Failure to maintain a proper maintenance and/or irrigation program may jeopardize the integrity of the pavement.

Earthwork recommendations regarding aggregate base and subgrade are provided in the previous Section 4.1 (Site Earthwork) and the related sub-sections of this report.

4.9 Nonstructural Concrete Flatwork

Nonstructural concrete flatwork (such as walkways, private drives, patio slabs, etc.) has a potential for cracking due to changes in soil volume related to soil-moisture fluctuations. To reduce the potential for excessive cracking and lifting, concrete may be designed in accordance with the minimum guidelines outlined in Table 7 on the following page. These guidelines will reduce the potential for irregular cracking and promote cracking along construction joints but will not eliminate all cracking or lifting. Thickening the concrete and/or adding additional reinforcement will further reduce cosmetic distress.

TABLE 7

Nonstructural Concrete Flatwork for Low Expansion Potential

	Homeowner Sidewalks	Private Drives	Patios/ Entryways	City Sidewalk Curb and Gutters
Minimum Thickness (in.)	4 (nominal)	4 (full)	4 (full)	City/Agency Standard
Presoaking	Wet down prior to placing	Wet down prior to placing	Wet down prior to placing	City/Agency Standard
Reinforcement	—	No. 3 at 24 inches on centers	No. 3 at 24 inches on centers	City/Agency Standard
Thickened Edge (in.)	—	8 x 8	—	City/Agency Standard
Crack Control Joints	Saw cut or deep open tool joint to a minimum of $^1/_3$ the concrete thickness	Saw cut or deep open tool joint to a minimum of $^1/_3$ the concrete thickness	Saw cut or deep open tool joint to a minimum of $^1/_3$ the concrete thickness	City/Agency Standard
Maximum Joint Spacing	5 feet	10 feet or quarter cut whichever is closer	6 feet	City/Agency Standard
Aggregate Base Thickness (in.)	—	—	—	City/Agency Standard

To reduce the potential for driveways to separate from the garage slab, the builder may elect to install dowels to tie these two elements together. Similarly, future homeowners should consider the use of dowels to connect flatwork to the foundation.

4.10 Geotechnical Plan Review

When available, grading, retaining wall and foundation plans should be reviewed by LGC Geotechnical in order to verify our geotechnical recommendations are implemented. Updated recommendations and/or additional field work may be necessary.

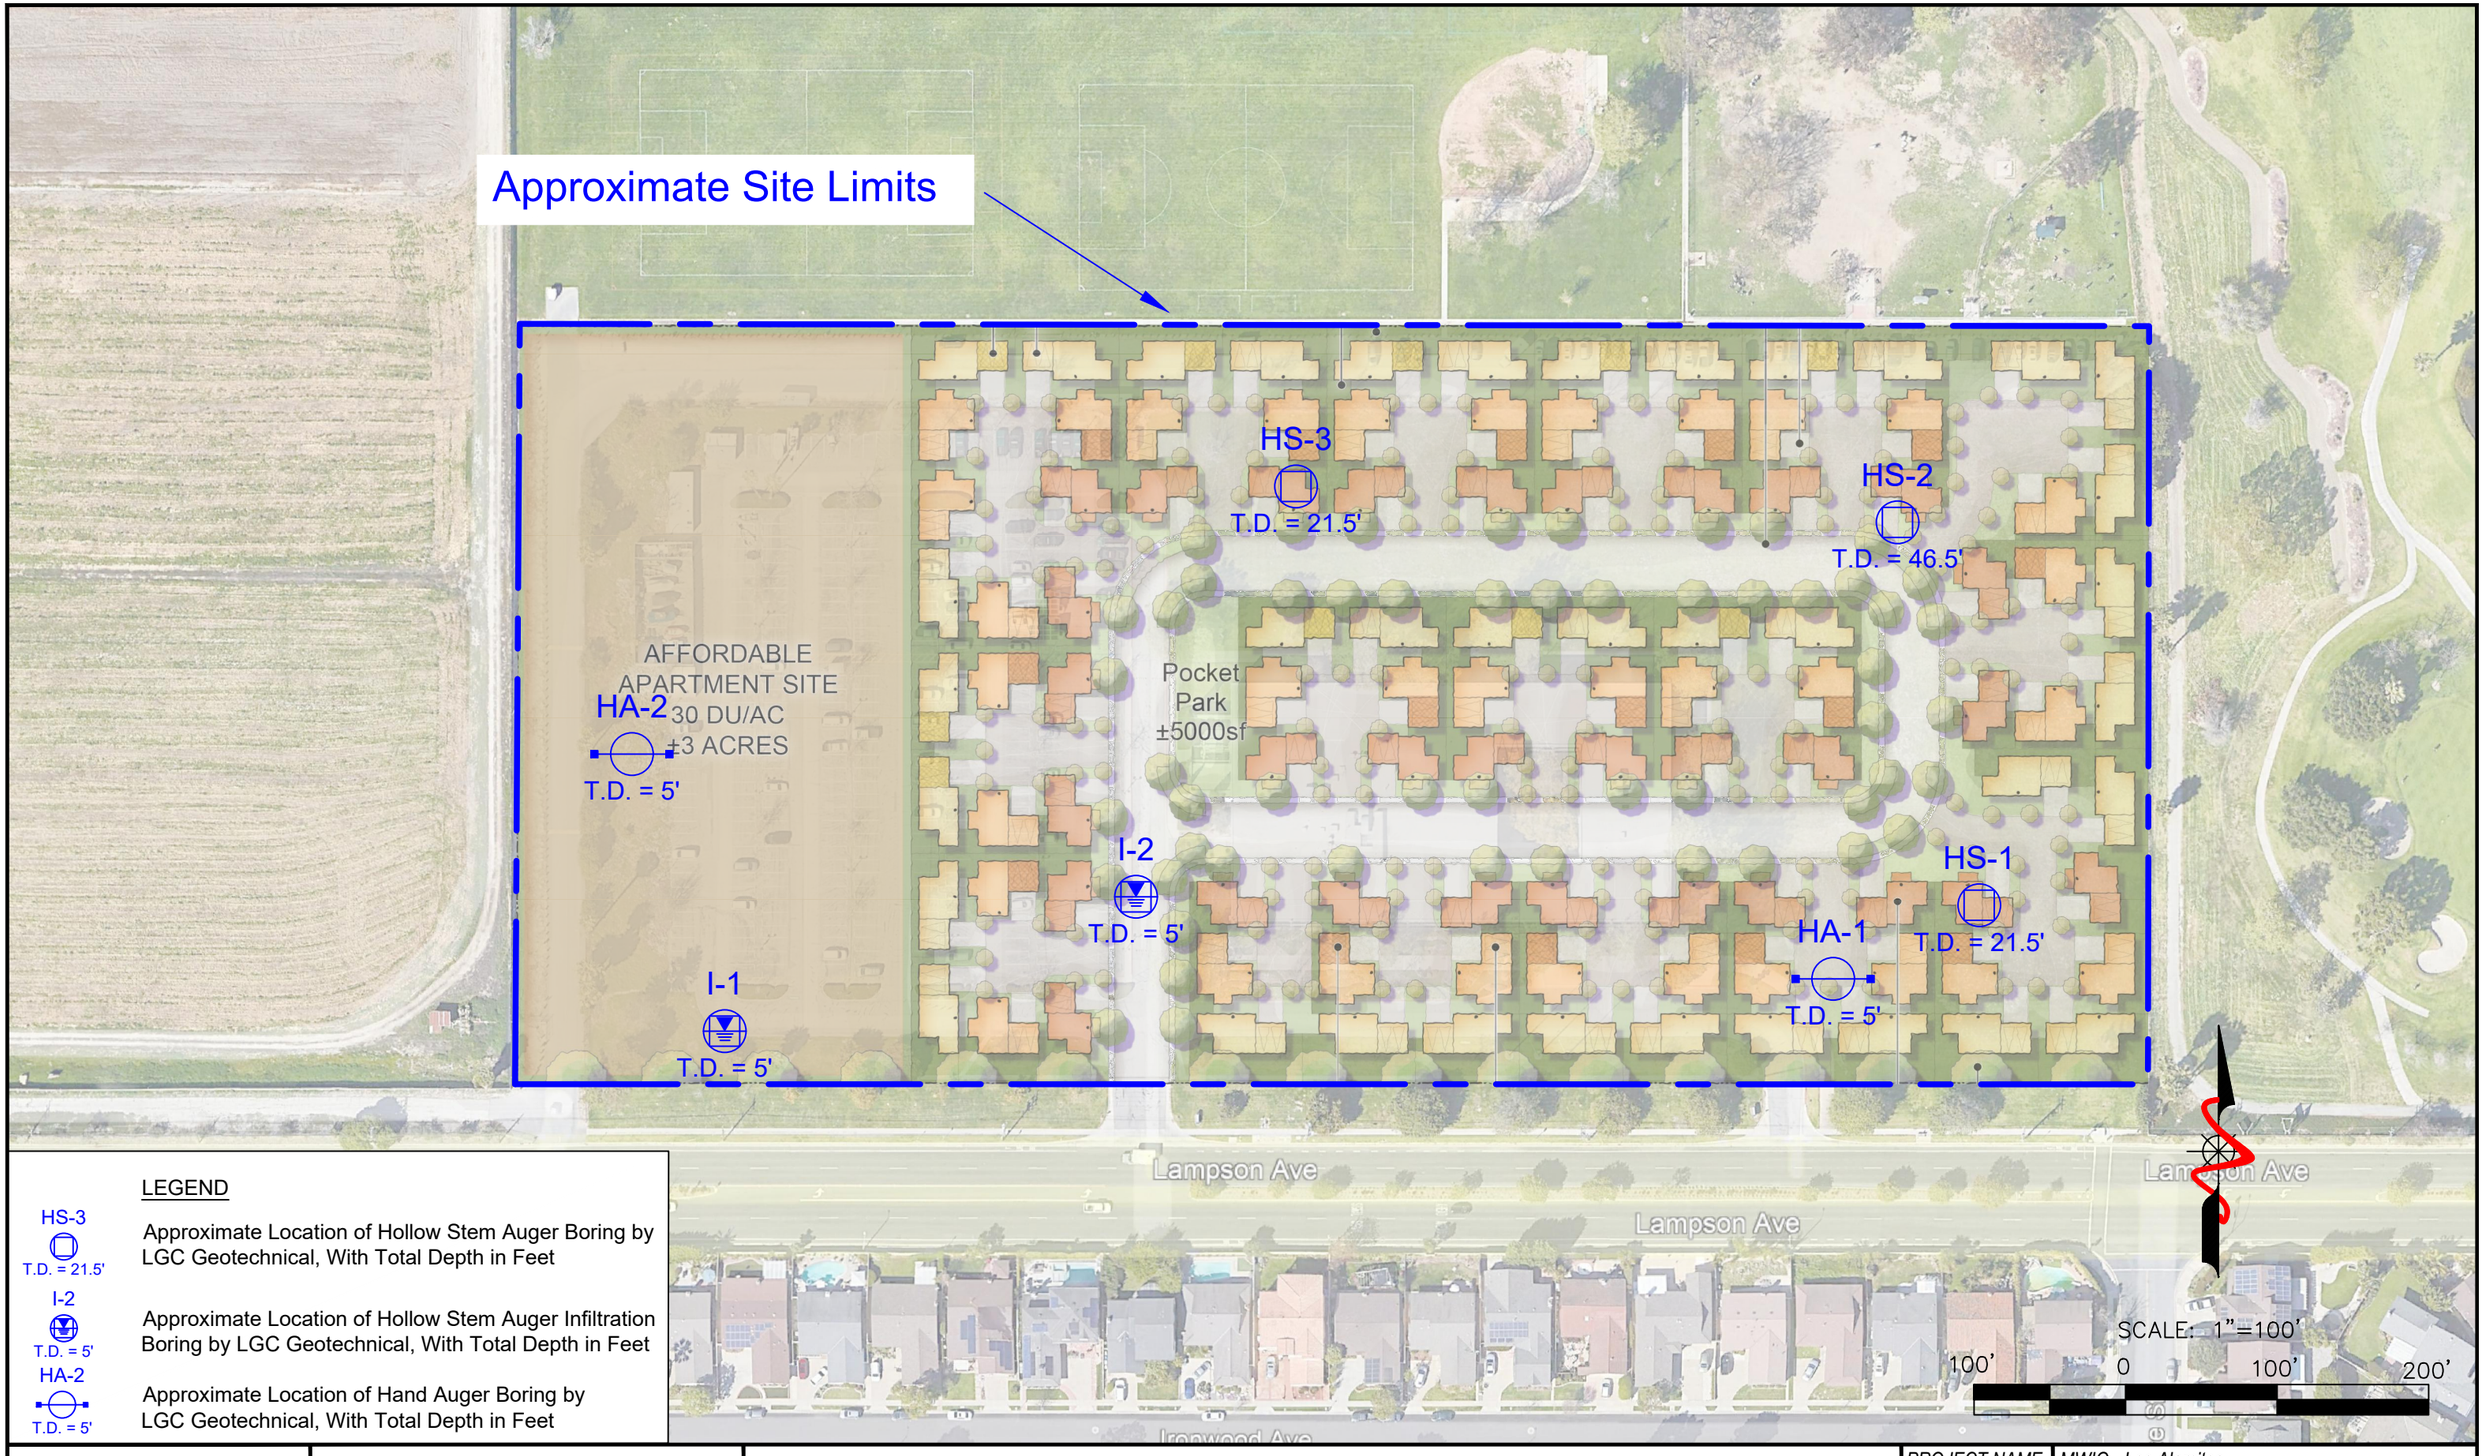
4.11 Geotechnical Observation and Testing During Construction

The recommendations provided in this report are based on limited subsurface observations and geotechnical analysis. The interpolated subsurface conditions should be checked in the field during construction by a representative of LGC Geotechnical. Geotechnical observation and testing is required per Section 1705 of the 2019 California Building Code (CBC).

Geotechnical observation and/or testing should be performed by LGC Geotechnical at the following stages:

- During grading (removal bottoms, fill placement, etc);
- During retaining wall backfill and compaction;
- During utility trench backfill and compaction;
- After presoaking building pads and other concrete-flatwork subgrades, and prior to placement of aggregate base or concrete;
- Preparation of pavement subgrade and placement of aggregate base;
- After building and wall footing excavation and prior to placing steel reinforcement and/or concrete; and
- When any unusual soil conditions are encountered during any construction operation subsequent to issuance of this report.

5.0 LIMITATIONS



Our services were performed using the degree of care and skill ordinarily exercised, under similar circumstances, by reputable soils engineers and geologists practicing in this or similar localities. No other warranty, expressed or implied, is made as to the conclusions and professional advice included in this report.

This report is based on data obtained from limited observations of the site, which have been extrapolated to characterize the site. While the scope of services performed is considered suitable to adequately characterize the site geotechnical conditions relative to the proposed development, no practical evaluation can completely eliminate uncertainty regarding the anticipated geotechnical conditions in connection with a subject site. Variations may exist and conditions not observed or described in this report may be encountered during grading and construction.

This report is issued with the understanding that it is the responsibility of the owner, or of his/her representative, to ensure that the information and recommendations contained herein are brought to the attention of the other consultants (at a minimum the civil engineer, structural engineer, landscape architect) and incorporated into their plans. The contractor should properly implement the recommendations during construction and notify the owner if they consider any of the recommendations presented herein to be unsafe, or unsuitable.

The findings of this report are valid as of the present date. However, changes in the conditions of a site can and do occur with the passage of time, whether they be due to natural processes or the works of man on this or adjacent properties. The findings, conclusions, and recommendations presented in this report can be relied upon only if LGC Geotechnical has the opportunity to observe the subsurface conditions during grading and construction of the project, in order to confirm that our preliminary findings are representative for the site. This report is intended exclusively for use by the client, any use of or reliance on this report by a third party shall be at such party's sole risk.

In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and modification.

Appendix C
Laboratory Test Results

APPENDIX C

Laboratory Testing Procedures and Test Results

The laboratory testing program was formulated towards providing data relating to the relevant engineering properties of the soils with respect to residential construction. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on relatively undisturbed samples obtained from the test borings and/or trenches. The results of these tests are presented in the boring logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Expansion Index: The expansion potential of selected samples was evaluated by the Expansion Index Test, Standard ASTM D4829. Specimens are molded under a given compactive energy to approximately the optimum moisture content and approximately 50 percent saturation or approximately 90 percent relative compaction. The prepared 1-inch-thick by 4-inch-diameter specimens are loaded to an equivalent 144 psf surcharge and are inundated with tap water until volumetric equilibrium is reached. The results of these tests are presented in the table below.

Sample Location	Expansion Index	Expansion Potential*
HS-3 @ 1-5 feet	32	Low
HA-2 @ 1-5 feet	30	Low

* ASTM D4829

Grain Size Distibution/Fines Content: Representative samples were dried, weighed and soaked in water until individual soil particles were separated (per ASTM D421) and then washed on a No. 200 sieve (ASTM D1140). Where applicable, the portion retained on the No. 200 sieve and dried and then sieved on a U.S. Standard brass sieve set in accordance with ASTM D6913 (sieve).

Sample Location	Description	% Passing # 200 Sieve
HS-2 @ 40 feet	Silty Sand	16.5
HS-2 @ 45 feet	Silty Sand	15

Laboratory Testing Procedures and Test Results

Atterberg Limits: The liquid and plastic limits ("Atterberg Limits") were determined per ASTM D4318 for engineering classification of fine-grained material and presented in the table below. The USCS soil classification indicated in the table below is based on the portion of sample passing the No. 40 sieve and may not necessarily be representative of the entire sample. The plot is provided in this Appendix.

Sample Location	Liquid Limit (%)	Plastic Limit (%)	Plasticity Index (%)	USCS Soil Classification
HS-2 @ 7.5 feet	31	19	12	CL
HS-2 @ 15 feet	34	17	17	CL
HS-2 @ 30 feet	35	16	19	CL
HS-3 @ 7.5 feet	48	24	24	CL

Consolidation: Two consolidation tests were performed per ASTM D2435. A sample (2.4 inches in diameter and 1 inch in height) was placed in a consolidometer and increasing loads were applied. The sample was allowed to consolidate under "double drainage" and total deformation for each loading step was recorded. The percent consolidation for each load step was recorded as the ratio of the amount of vertical compression to the original sample height. The consolidation pressure curve is provided in this Appendix.

Direct Shear: One direct shear test was performed on remolded samples, which was soaked for a minimum of 24 hours prior to testing. The samples were tested under various normal loads using a motor-driven, strain-controlled, direct-shear testing apparatus (ASTM D3080). The plot is provided in this Appendix.

Maximum Density Tests: The maximum dry density and optimum moisture content of typical materials were determined in accordance with ASTM D1557. The results of these tests are presented in the table below:

Sample Location	Sample Description	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
HS-3 @ 1-5 feet	Dark Olive Brown Clayey Sand	116.0	13.0

Laboratory Testing Procedures and Test Results

Chloride Content: Chloride content was tested in accordance with Caltrans Test Method (CTM) 422. The results are presented below.

Sample Location	Chloride Content, ppm
HS-3 @ 1-5 feet	600
HA-2 @ 1-5 feet	140

Soluble Sulfates: The soluble sulfate contents of selected samples were determined by standard geochemical methods (CTM 417). The soluble sulfate content is used to determine the appropriate cement type and maximum water-cement ratios. The test results are presented in the table below.

Sample Location	Sulfate Content (ppm)	Sulfate Exposure Class *
HS-3 @ 1-5 feet	2535	S2
HA-2 @ 1-5 feet	317	S0

*Based on ACI 318R-14, Table 19.3.1.1

Minimum Resistivity and pH Tests: Minimum resistivity and pH tests were performed in general accordance with CTM 643 and standard geochemical methods. The results are presented in the table below.

Sample Location	pH	Minimum Resistivity (ohms-cm)
HS-3 @ 1-5 feet	8.92	210

Appendix E
General Earthwork and Grading Specifications for Rough Grading

General Earthwork and Grading Specifications for Rough Grading

1.0 General

1.1 Intent

These General Earthwork and Grading Specifications are for the grading and earthwork shown on the approved grading plan(s) and/or indicated in the geotechnical report(s). These Specifications are a part of the recommendations contained in the geotechnical report(s). In case of conflict, the specific recommendations in the geotechnical report shall supersede these more general Specifications. Observations of the earthwork by the project Geotechnical Consultant during the course of grading may result in new or revised recommendations that could supersede these specifications or the recommendations in the geotechnical report(s).

1.2 The Geotechnical Consultant of Record

Prior to commencement of work, the owner shall employ a qualified Geotechnical Consultant of Record (Geotechnical Consultant). The Geotechnical Consultant shall be responsible for reviewing the approved geotechnical report(s) and accepting the adequacy of the preliminary geotechnical findings, conclusions, and recommendations prior to the commencement of the grading.

Prior to commencement of grading, the Geotechnical Consultant shall review the "work plan" prepared by the Earthwork Contractor (Contractor) and schedule sufficient personnel to perform the appropriate level of observation, mapping, and compaction testing.

During the grading and earthwork operations, the Geotechnical Consultant shall observe, map, and document the subsurface exposures to verify the geotechnical design assumptions. If the observed conditions are found to be significantly different than the interpreted assumptions during the design phase, the Geotechnical Consultant shall inform the owner, recommend appropriate changes in design to accommodate the observed conditions, and notify the review agency where required.

The Geotechnical Consultant shall observe the moisture-conditioning and processing of the subgrade and fill materials and perform relative compaction testing of fill to confirm that the attained level of compaction is being accomplished as specified. The Geotechnical Consultant shall provide the test results to the owner and the Contractor on a routine and frequent basis.

1.3 The Earthwork Contractor

The Earthwork Contractor (Contractor) shall be qualified, experienced, and knowledgeable in earthwork logistics, preparation and processing of ground to receive fill, moisture-conditioning and processing of fill, and compacting fill. The Contractor shall review and accept the plans, geotechnical report(s), and these Specifications prior to commencement of grading. The Contractor shall be solely responsible for performing the grading in accordance with the project plans and specifications. The Contractor shall prepare and submit to the owner and the Geotechnical Consultant a work plan that indicates the sequence of earthwork grading, the number of “equipment” of work and the estimated quantities of daily earthwork

contemplated for the site prior to commencement of grading. The Contractor shall inform the owner and the
Geotechnical Consultant of changes in work schedules and updates to the work plan at least 24 hours in advance of such changes so that appropriate personnel will be available for observation and testing. The Contractor shall not assume that the Geotechnical Consultant is aware of all grading operations.

The Contractor shall have the sole responsibility to provide adequate equipment and methods to accomplish the earthwork in accordance with the applicable grading codes and agency ordinances, these Specifications, and the recommendations in the approved geotechnical report(s) and grading plan(s). If, in the opinion of the Geotechnical Consultant, unsatisfactory conditions, such as unsuitable soil, improper moisture condition, inadequate compaction, insufficient buttress key size, adverse weather, etc., are resulting in a quality of work less than required in these specifications, the Geotechnical Consultant shall reject the work and may recommend to the owner that construction be stopped until the conditions are rectified. It is the contractor's sole responsibility to provide proper fill compaction.

2.0 Preparation of Areas to be Filled

2.1 Clearing and Grubbing

Vegetation, such as brush, grass, roots, and other deleterious material shall be sufficiently removed and properly disposed of in a method acceptable to the owner, governing agencies, and the Geotechnical Consultant.

The Geotechnical Consultant shall evaluate the extent of these removals depending on specific site conditions. Earth fill material shall not contain more than 1 percent of organic materials (by volume). Nesting of the organic materials shall not be allowed.

If potentially hazardous materials are encountered, the Contractor shall stop work in the affected area, and a hazardous material specialist shall be informed immediately for proper evaluation and handling of these materials prior to continuing to work in that area.

As presently defined by the State of California, most refined petroleum products (gasoline, diesel fuel, motor oil, grease, coolant, etc.) have chemical constituents that are considered to be hazardous waste. As such, the indiscriminate dumping or spillage of these fluids onto the ground may constitute a misdemeanor, punishable by fines and/or imprisonment, and shall not be allowed. The contractor is responsible for all hazardous waste relating to his work. The Geotechnical Consultant does not have expertise in this area. If hazardous waste is a concern, then the Client should acquire the services of a qualified environmental assessor.

2.2 Processing

Existing ground that has been declared satisfactory for support of fill by the Geotechnical Consultant shall be scarified to a minimum depth of 6 inches. Existing ground that is not satisfactory shall be over-excavated as specified in the following section. Scarification shall continue until soils are broken down and free of oversize material and the working surface is reasonably uniform, flat, and free of uneven features that would inhibit uniform compaction.

2.3 Over-excavation

In addition to removals and over-excavations recommended in the approved geotechnical report(s) and the grading plan, soft, loose, dry, saturated, spongy, organic-rich, highly fractured or otherwise unsuitable ground shall be over-excavated to competent ground as evaluated by the Geotechnical Consultant during grading.

2.4 Benching

Where fills are to be placed on ground with slopes steeper than 5:1 (horizontal to vertical units), the ground shall be stepped or benched. Please see the Standard Details for a graphic illustration. The lowest bench or key shall be a minimum of 15 feet wide and at least 2 feet deep, into competent material as evaluated by the Geotechnical Consultant. Other benches shall be excavated a minimum height of 4 feet into competent material or as otherwise recommended by the Geotechnical Consultant. Fill placed on ground sloping flatter than 5:1 shall also be benched or otherwise over-excavated to provide a flat subgrade for the fill.

2.5 Evaluation/Acceptance of Fill Areas

All areas to receive fill, including removal and processed areas, key bottoms, and benches, shall be observed, mapped, elevations recorded, and/or tested prior to being accepted by the Geotechnical Consultant as suitable to receive fill. The Contractor shall obtain a written acceptance from the Geotechnical Consultant prior to fill placement. A licensed surveyor shall provide the survey control for determining elevations of processed areas, keys, and benches.

3.0 Fill Material

3.1 General

Material to be used as fill shall be essentially free of organic matter and other deleterious substances evaluated and accepted by the Geotechnical Consultant prior to placement. Soils of poor quality, such as those with unacceptable gradation, high expansion potential, or low strength shall be placed in areas acceptable to the Geotechnical Consultant or mixed with other soils to achieve satisfactory fill material.

3.2 Oversize

Oversize material defined as rock, or other irreducible material with a maximum dimension greater than 8 inches, shall not be buried or placed in fill unless location, materials, and placement methods are specifically accepted by the Geotechnical Consultant. Placement operations shall be such that nesting of oversized material does not occur and such that oversize material is completely surrounded by compacted or densified fill. Oversize material shall not be placed within 10 vertical feet of finish grade or within 2 feet of future utilities or underground construction.

3.3 Import

If importing of fill material is required for grading, proposed import material shall meet the requirements of the geotechnical consultant. The potential import source shall be given to the Geotechnical Consultant at least 48 hours (2 working days) before importing begins so that its suitability can be determined and appropriate tests performed.

4.0 Fill Placement and Compaction

4.1 Fill Layers

Approved fill material shall be placed in areas prepared to receive fill (per Section 3.0) in near-horizontal layers not exceeding 8 inches in loose thickness. The Geotechnical Consultant may accept thicker layers if testing indicates the grading procedures can adequately compact the thicker layers. Each layer shall be spread evenly and mixed thoroughly to attain relative uniformity of material and moisture throughout.

4.2 Fill Moisture Conditioning

Fill soils shall be watered, dried back, blended, and/or mixed, as necessary to attain a relatively uniform moisture content at or slightly over optimum. Maximum density and optimum soil moisture content tests shall be performed in accordance with the American Society of Testing and Materials (ASTM Test Method D1557).

4.3 Compaction of Fill

After each layer has been moisture-conditioned, mixed, and evenly spread, it shall be uniformly compacted to not less than 90 percent of maximum dry density (ASTM Test Method D1557). Compaction equipment shall be adequately sized and be either specifically designed for soil compaction or of proven reliability to efficiently achieve the specified level of compaction with uniformity.

4.4 Compaction of Fill Slopes

In addition to normal compaction procedures specified above, compaction of slopes shall be accomplished by backrolling of slopes with sheepsfoot rollers at increments of 3 to 4 feet in fill elevation, or by other methods producing satisfactory results acceptable to the Geotechnical Consultant. Upon completion of grading, relative compaction of the fill, out to the slope face, shall be at least 90 percent of maximum density per ASTM Test Method D1557.

4.5 Compaction Testing

Field tests for moisture content and relative compaction of the fill soils shall be performed by the Geotechnical Consultant. Location and frequency of tests shall be at the Consultant's discretion based on field conditions encountered. Compaction test locations will not necessarily be selected on a random basis. Test locations shall be selected to verify adequacy of compaction levels in areas that are judged to be prone to inadequate compaction (such as close to slope faces and at the fill/bedrock benches).

4.6 Frequency of Compaction Testing

Tests shall be taken at intervals not exceeding 2 feet in vertical rise and/or 1,000 cubic yards of compacted fill soils embankment. In addition, as a guideline, at least one test shall be taken on slope faces for each 5,000 square feet of slope face and/or each 10 feet of vertical height of slope. The Contractor shall assure that fill construction is such that the testing schedule can be accomplished by the Geotechnical Consultant. The Contractor shall stop or slow down the earthwork construction if these minimum standards are not met.

4.7 Compaction Test Locations

The Geotechnical Consultant shall document the approximate elevation and horizontal coordinates of each test location. The Contractor shall coordinate with the project surveyor to assure that sufficient grade stakes are established so that the Geotechnical Consultant can determine the test locations with sufficient accuracy. At a minimum, two grade stakes within a horizontal distance of 100 feet and vertically less than
5 feet apart from potential test locations shall be provided.

5.0 Subdrain Installation

Subdrain systems shall be installed in accordance with the approved geotechnical report(s), the grading plan, and the Standard Details. The Geotechnical Consultant may recommend additional subdrains and/or changes in subdrain extent, location, grade, or material depending on conditions encountered during grading. All subdrains shall be surveyed by a land surveyor/civil engineer for line and grade after installation and prior to burial. Sufficient time should be allowed by the Contractor for these surveys.

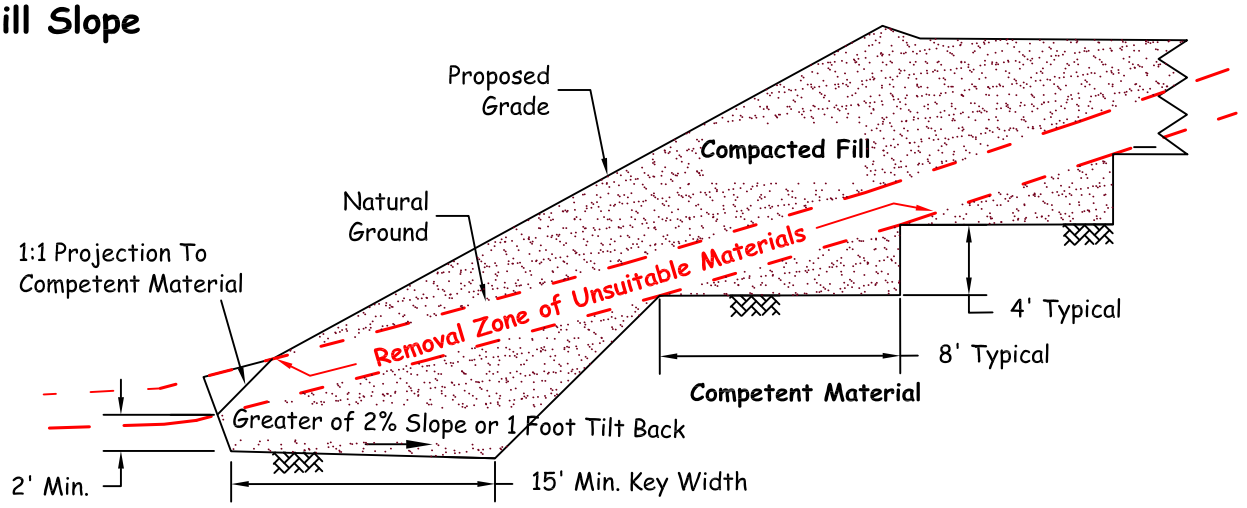
6.0 Excavation

Excavations, as well as over-excavation for remedial purposes, shall be evaluated by the Geotechnical Consultant during grading. Remedial removal depths shown on geotechnical plans are estimates only. The actual extent of removal shall be determined by the Geotechnical Consultant based on the field evaluation of exposed conditions during grading. Where fill-over-cut slopes are to be graded, the cut portion of the slope shall be made, evaluated, and accepted by the Geotechnical Consultant prior to placement of materials for construction of the fill portion of the slope, unless otherwise recommended by the Geotechnical Consultant.

7.0 Trench Backfills

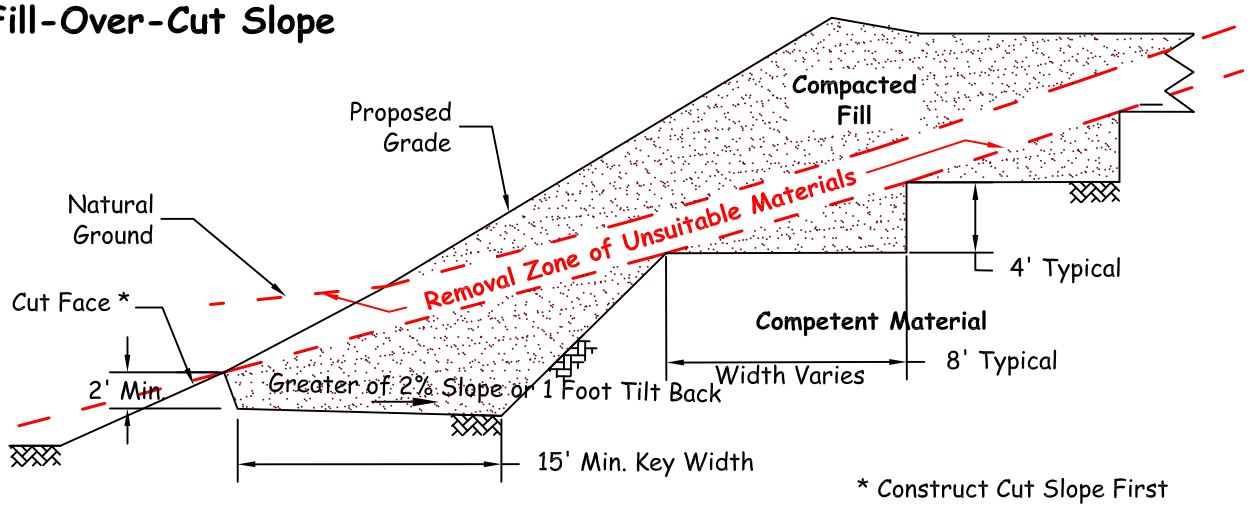
7.1 The Contractor shall follow all OHSA and Cal/OSHA requirements for safety of trench excavations.

7.2 All bedding and backfill of utility trenches shall be done in accordance with the applicable provisions of Standard Specifications of Public Works Construction. Bedding material shall have a Sand Equivalent greater than 30 (SE>30). The bedding shall be placed to 1 foot over



the top of the conduit and densified by jetting. Backfill shall be placed and densified to a minimum of 90 percent of maximum from 1 foot above the top of the conduit to the surface.

7.3 The jetting of the bedding around the conduits shall be observed by the Geotechnical Consultant.



7.4 The Geotechnical Consultant shall test the trench backfill for relative compaction. At least one test should be made for every 300 feet of trench and 2 feet of fill.

7.5 Lift thickness of trench backfill shall not exceed those allowed in the Standard Specifications of Public Works Construction unless the Contractor can demonstrate to the Geotechnical Consultant that the fill lift can be compacted to the minimum relative compaction by his alternative equipment and method.

Notice of Responsibility of Transfer Form

Water Quality Management Plan
Notice of Transfer of Responsibility

Submission of this Notice of Transfer of Responsibility constitutes notice to the City of Los Alamitos that responsibility for the Water Quality Management Plan ("WQMP") for the subject property identified below, and implementation of that plan, is being transferred from the Previous Owner (and his/ her agent) of the site (or a portion thereof) to the New Owner, as further described below.

I. Previous Owner/ Previous Responsibility Party Information

Company/ Individual Name		Contact Person	
Street Address		Title	
City	State	Zip	Phone

II. Information about Site Transferred

Name of Project			
Title of WQMP Applicable to Site:			
Street Address of Site			
Tract Number(s) for Site		Lot Numbers	
Date WQMP Prepared (or Revised)			

III. New Owner/ New Responsible Party Information

Company/ Individual Name		Contact Person	
Street Address		Title	
City	State	Zip	Phone

IV. Ownership Transfer Information

General Description of Site Transferred to New Owner	General Description of Portion of Project/ Parcel Subject to WQMP Retained by Owner (if any)
Lot/ Tract Number(s) of Site Transferred to New Owner	
Remaining Lot/ Tract Number(s) to WQMP still held by Owner (if any)	
Date of Ownership Transfer	

Note: When the Previous Owner is transferring a Site that is a portion of a larger project/ parcel addressed by the WQMP, as opposed to the entire project/ parcel addressed by the WQMP, the General Description of the Site transferred and the remainder of the project/ parcel no transferred shall be set forth as maps attached to this notice. These maps shall show those portions of the project/ parcel addressed by the WQMP that are transferred to the New Owner (the Transferred Site), those portions retained by the Previous Owner, and those portions previously transferred by the Previous Owner. Those portions retained by the Previous Owner shall be labeled "Previous Owner," and those portions previously transferred by the Previous Owner shall be labeled as "Previously Transferred."

V. Purpose of Notice of Transfer

The purposes of this Notice of Transfer of Responsibility are: 1) to track transfer of responsibility for implementation and amendment of the WQMP when property to which the WQMP is transferred from the Previous Owner to the New Owner, and 2) to facilitate notification to a transferee of property subject to a WQMP that such New Owner is now the Responsible Party of record for the WQMP for this portions of the site that it owns.

VI. Certifications

A. Previous Owner

I certify under penalty of law that I am no longer the owner of the Transferred Site as described in Section II above. I have provided the New Owner with a copy of the WQMP applicable to the Transferred Site that the New Owner is acquiring from the New Owner.

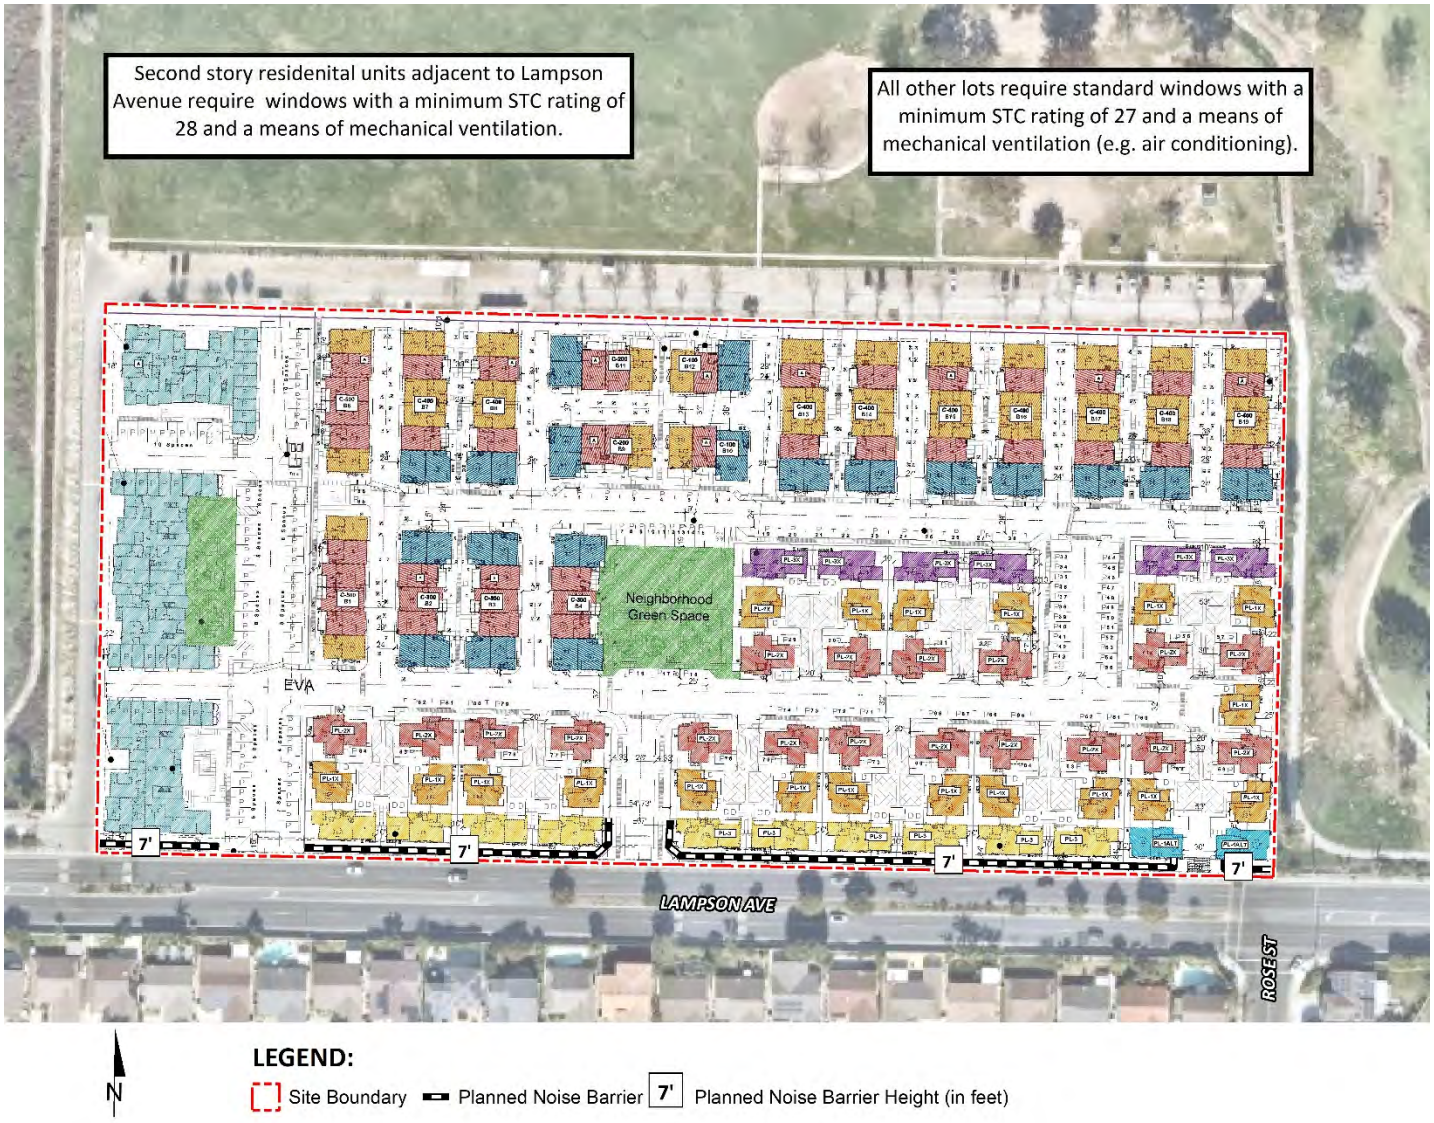
EXECUTIVE SUMMARY

Urban Crossroads, Inc. has prepared this noise study to evaluate potential noise associated with proposed development at 4665 Lampson Avenue ("Project") in the City of Los Alamitos. The Project is proposed to include the development of 55 single family detached residential dwelling units (cluster homes), 114 multifamily (low-rise) residential dwelling units, and 77 affordable apartment dwelling units (total of 246 dwelling units) and demolition of the existing 88,000 square foot commercial office building. This study has been prepared to evaluate the Project's potential noise impacts in light of the thresholds of significance identified in Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (1)

ON-SITE TRAFFIC NOISE ANALYSIS



An on-site exterior and interior noise impact analysis has been completed to determine the traffic-related noise levels and to identify potential necessary abatement measures for the proposed Project. It is expected that the primary source of traffic-related noise impacts to the Project site will be from Lampson Avenue.

EXTERIOR TRAFFIC NOISE ANALYSIS

The on-site traffic noise level impacts indicate that noise levels at the Project buildings adjacent to Lampson Avenue would experience exterior noise levels ranging from 64.6 to 72.8 dBA CNEL. Therefore, to reduce noise levels to 65 dBA CNEL or less in compliance with the City of Los Alamitos exterior noise level noise and land use compatibility policies, the Project would include Noise 1 in the Project design and construct a seven (7) foot-high noise barrier along Lampson Avenue, shown in Exhibit ES-A. With the barrier, exterior noise levels will range from 58.3 to 63.8 dBA CNEL at backyards of residential units and common outdoor activity areas of multi-family residential units. This noise analysis shows that with the proposed noise barrier the Project will satisfy the City of Los Alamitos 65 dBA CNEL normally acceptable exterior noise level standards for residential land uses. The identified noise barrier heights represent the minimum wall and/or berm combination height required to satisfy the City of Los Alamitos exterior noise level standards.

Noise 1 The Project will construct a 7-foot-high noise barrier along Lampson Avenue, as shown in Exhibit ES-A. The noise control barrier will be constructed so that the top of each wall and /or berm combination extends to the planned height above the pad elevation of the lot it is shielding. When the roadway or terrain is elevated above the pad elevation, the barrier shall extend to the recommended height above the highest point between the residential home and the roadway. The barrier shall be built with a material surface weight of at least 4 pounds per square foot, with no decorative cutouts, perforations, or line-of-sight openings between residences and Lampson Avenue. (2) The noise barrier shall be constructed using the following materials:

EXHIBIT ES-A: NOISE CONTROL MEASURE SUMMARY

- masonry block;
- stucco veneer over wood framing (or foam core), or 1-inch-thick tongue and groove wood of sufficient weight per square foot;
- glass (1/4-inch-thick),
- material with sufficient weight per square foot capable of providing a minimum transmission loss of 20 dBA;
- earthen berm; or,
- any combination of these construction materials.

INTERIOR TRAFFIC NOISE ABATEMENT

Typical building construction will provide a Noise Reduction (NR) of approximately 12 dBA with "windows open" and a minimum 25 dBA noise reduction with "windows closed." (3) (4) The Project will provide mechanical ventilation (e.g. air conditioning) for all units which would allow a windows-closed condition. Based on predicted exterior noise levels, to satisfy the State of California and the City of Los Alamitos 45 dBA CNEL interior noise level criteria, first-floor units are being designed to meet a Noise Reduction (NR) of 20.3 dBA at first floors and 26.3 dBA at second floors for units adjacent to Lampson Avenue. Therefore, the Project will provide second floor units with windows that have an STC rating of 29. The Project includes the following Project design feature:

Noise: 2 To comply with the State of California and City of Los Alamitos 45 dBA CNEL interior noise standards for residential land use the Project will provide the following or equivalent noise abatement measures on building plans:

- Windows & Glass Doors: At a minimum the Project will provide windows and glass doors that are well-fitted, well-weather-stripped assemblies with minimum sound transmission class (STC) ratings of 27. Additionally, all second floor facades adjacent to Lampson Avenue will be provided windows and glass doors that are well-fitted, well-weather-stripped assemblies with minimum sound transmission class (STC) ratings of 29.
- Doors (Non-Glass): All exterior doors shall be well weather-stripped and have. Well-sealed perimeter gaps around the doors are essential to achieve the optimal STC rating. (5)
- Walls: At any penetrations of exterior walls by pipes, ducts, or conduits, the space between the wall and pipes, ducts, or conduits shall be caulked or filled with mortar to form an airtight seal.
- Roof: Roof sheathing of wood construction shall be per manufacturer's specification or caulked plywood of at least one-half inch thick. Ceilings shall be per manufacturer's specification or well-sealed gypsum board of at least one-half inch thick. Insulation with at least a rating of R-19 shall be used in the attic space.
- Ventilation: Arrangements for any habitable room shall be such that any exterior door or window can be kept closed when the room is in use and still receive circulated air. A forced air circulation system (e.g. air conditioning) or active ventilation system

(e.g. fresh air supply) shall be provided which satisfies the requirements of the Uniform Building Code.

OFF-SITE TRAFFIC NOISE ANALYSIS

Traffic generated by the operation of the proposed Project will influence the traffic noise levels in surrounding off-site areas. To quantify the traffic noise increases on the surrounding off-site areas, the changes in traffic noise levels on sixteen roadway segments surrounding the Project site were calculated based on the change in the average daily traffic (ADT) volumes. The traffic noise levels provided in this analysis are based on the traffic forecasts found in *4665 Lampson Avenue Traffic Impact Analysis* prepared by Urban Crossroads, Inc. (6) To assess the off-site noise level impacts associated with the proposed Project, noise level contour boundaries were developed for Existing 2023, Opening Year 2026 (OY 2026), and General Plan Buildout 2045(GBPO 2045) without and with Project traffic conditions. Land uses along roadway segments analyzed would experience Project related traffic noise level increases of up to 1.0 dBA CNEL. Therefore, the analysis shows that the Project-related traffic noise level increases under all scenarios would be *less than significant*.

OPERATIONAL NOISE ANALYSIS

The Project would include specific type of operational noise attributable to the Project, including roof-top and ground-mounted air conditioning units, parking lot vehicle movements, outdoor activity, and trash enclosure activities. Project operational noise levels during the daytime hours at off-site receiver locations are expected to range from 20.4 to 46.9 dBA $L_{eq.}$ Project operational noise levels during the nighttime hours at off-site receiver locations are expected to range from 16.8 to 43.7 dBA L_{eq}. Project operational noise levels will satisfy Section 17.20.050 of the City of Los Alamitos Municipal Code daytime and nighttime noise standards of 55 dBA and 50 dBA L_{eq}, respectively, at all residential receivers. Therefore, potential operational noise impacts for the residential land use are anticipated to result in *less than significant* impacts.

CONSTRUCTION NOISE ANALYSIS

Construction noise levels are expected to create temporary and intermittent high-level noise conditions at receivers surrounding the Project site when certain activities occur at the closest point to the nearby receiver locations from the edge of primary Project construction activity. Using sample reference noise levels to represent the construction activities at the Project site, this analysis estimates the Project-related construction noise levels at nearby sensitive receiver locations. The results of the analysis show the highest construction noise levels at the potentially impacted receiver locations are expected to approach 63.2 dBA L_{eq}.

The Project related construction equipment noise levels are anticipated to satisfy the FTA construction noise level standards of 80 dBA L_{eq} for mobile equipment during typical Project construction activities at all receiver locations. Additionally, construction activities are planned to typically occur between 7:00 a.m. and 6:00 p.m. and would comply with the City of Los Alamitos limitation on allowable hours of construction per Section 17.20.020. Therefore, based

on the results of this analysis, all nearby sensitive receiver locations will experience *less than significant* impacts due to Project construction noise levels.

CONSTRUCTION VIBRATION ANALYSIS

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from Project construction activities would cause only intermittent, localized intrusion. Ground-borne vibration levels resulting from typical construction activities occurring within the Project site were estimated by data published by the Federal Transit Administration (FTA). At the nearest receivers Project construction vibration velocity levels are estimated to range from less than 0.00 to 0.02 in/sec PPV. Based on maximum acceptable continuous vibration threshold of 0.3 PPV (in/sec), the typical Project construction vibration levels will not exceed the City of Los Alamitos thresholds at properties located adjacent to the Project site. Therefore, vibration impacts due to Project construction activities would be *less than significant*.

AIRCRAFT NOISE ABATEMENT

Based on a review of noise level contours for the Joint Forces Training Base (JFTB) Los Alamitos, a portion of the proposed residential uses would be located within the conditionally consistent 60-65 dBA noise contour under projected conditions. As discussed under the on-site traffic noise traffic noise analysis, typical modern residential construction can achieve a noise level reduction of 25 dBA with windows closed. Thus, with the Project design feature Noise-1, a windows closed condition is evaluated, which indicates maximum interior noise levels would range from 35 to 40 dBA CNEL from aircraft noise exposure. As discussed, in the following analysis, exposure of exterior use areas to noise levels in excess of 70 dBA CNEL would be considered significant, and exposure of residential land uses to noise levels in excess of 65 dBA CNEL would be significant unless noise levels in interior habitable rooms are reduced to 45 dBA CNEL. Therefore, the Project would not expose people residing or working in the project area to excessive interior noise levels from airport or aircraft operations, and impacts would be *less than significant*.

SUMMARY OF SIGNIFICANCE FINDINGS

The results of 4665 Lampson Avenue Noise Impact Analysis are summarized below based on the significance criteria in Section 4 of this report consistent with Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (7). Table ES-1 shows the findings of significance for each potential noise and/or vibration impact under CEQA before and after any required mitigation measures.

TABLE ES-1: SUMMARY OF SIGNIFICANCE FINDINGS

Analysis	Report Section	Significance Findings		
		Unmitigated	Mitigated	Mitigated Measure
On-Site Traffic Noise	7	*Less Than Significant*[1]	-	-
Off-Site Traffic Noise	8	*Less Than Significant*	-	-
Operational Noise	10	*Less Than Significant*	-	-
Construction Noise	11	*Less Than Significant*	-	-
Construction Vibration		*Less Than Significant*	-	-
On-Site Aircraft Noise	12	*Less Than Significant*	-	-

[1] Less than significant with Project Design Features (Noise -1 and Noise -2)

1 INTRODUCTION

This noise analysis has been completed to evaluate the noise impacts associated with the development of the proposed 4665 Lampson Avenue project ("Project"). This noise study describes the Project, provides information regarding noise and vibration fundamentals, outlines the local regulatory setting, provides the study methods and procedures for performing noise analysis, evaluates potential noise impacts from the project, and identifies mitigation measures to reduce impacts, as necessary.

1.1 SITE LOCATION

The proposed Project is located at 4665 Lampson Avenue in the City of Los Alamitos. The Project's location in relation to the surrounding area is shown on Exhibit 1-A. The surrounding land use designations are Residential to the south, JFTB Los Alamitos to the north, the Navy Golf Course to the east, and Arbor Park (Community Facilities) to the west. Interstate 405 (I-405) is located approximately 0.48 miles south of the Project site.

1.2 PROJECT DESCRIPTION

The Project consists of the development of 55 single family detached residential dwelling units (cluster homes), 114 multifamily (low-rise) residential dwelling units, and 77 affordable apartment dwelling units (total of 246 dwelling units). A preliminary site plan for the proposed Project is shown on Exhibit 1-B. The site is currently occupied by a two-story, 88,000 square foot commercial office building and parking lot. Access to the Project site will be accommodated to Lampson Avenue via two proposed driveways. The Project is anticipated to generate an increase of 1,658 two-way trip-ends per day with 112 AM peak hour trips and 147 PM peak hour trips. The Project is anticipated to have an opening year of 2026.

2 FUNDAMENTALS

Noise has been simply defined as "unwanted sound." Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Noise is measured on a logarithmic scale of sound pressure level known as a decibel (dB). A-weighted decibels (dBA) approximate the subjective response of the human ear to broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear. Exhibit 2-A presents a summary of the typical noise levels and their subjective loudness and effects that are described in more detail below.

EXHIBIT 2-A: TYPICAL NOISE LEVELS

COMMON OUTDOOR ACTIVITIES	COMMON INDOOR ACTIVITIES	A - WEIGHTED SOUND LEVEL dBA	SUBJECTIVE LOUDNESS	EFFECTS OF NOISE
THRESHOLD OF PAIN		140	INTOLERABLE OR DEAFENING	HEARING LOSS
NEAR JET ENGINE		130		
		120		
JET FLY-OVER AT 300m (1000 ft)	ROCK BAND	110		
LOUD AUTO HORN		100	VERY NOISY	
GAS LAWN MOWER AT 1m (3 ft)		90		
DIESEL TRUCK AT 15m (50 ft), at 80 km/hr (50 mph)	FOOD BLENDER AT 1m (3 ft)	80		SPEECH INTERFERENCE
NOISY URBAN AREA, DAYTIME	VACUUM CLEANER AT 3m (10 ft)	70	LOUD	
HEAVY TRAFFIC AT 90m (300 ft)	NORMAL SPEECH AT 1m (3 ft)	60		
QUIET URBAN DAYTIME	LARGE BUSINESS OFFICE	50	MODERATE	SLEEP DISTURBANCE

	BROADCAST/RECORDING STUDIO	10	VERY FAINT	
LOWEST THRESHOLD OF HUMAN HEARING	LOWEST THRESHOLD OF HUMAN HEARING	0		

Source: Environmental Protection Agency Office of Noise Abatement and Control, Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (EPA/ONAC 550/9-74-004) March 1974.

2.1 RANGE OF NOISE

Since the range of intensities that the human ear can detect is so large, the scale frequently used to measure intensity is a scale based on multiples of 10, the logarithmic scale. The scale for measuring intensity is the decibel scale. Human perception of noise has no simple correlation with acoustical energy. The perception of noise is not linear in terms of dBA or in terms of acoustical energy. Two equivalent noise sources result in a 3 dBA increase. However, it is widely accepted that the average healthy ear can barely perceive changes of 3 dBA, increase or decrease; that a change of 5 dBA is readily perceptible; and that an increase (decrease) of 10 dBA

sounds twice (half) as loud (Caltrans 2009). The most common sounds vary between 40 dBA (very quiet) to 100 dBA (very loud). Normal conversation at three feet is roughly at 60 dBA, while loud jet engine noises equate to 110 dBA at approximately 100 feet, which can cause serious discomfort. (8) Another important aspect of noise is the duration of the sound and the way it is described and distributed in time.

2.2 NOISE DESCRIPTORS

Environmental noise descriptors are generally based on averages, rather than instantaneous, noise levels. The most commonly used figure is the equivalent level (L_{eq}). Equivalent sound levels are not measured directly but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period and is commonly used to describe the "average" noise levels within the environment.

To describe the time-varying character of environmental noise, the statistical or percentile noise descriptors L_{50}, L_{25}, L_8 and L_2, are commonly used. The percentile noise descriptors are the noise levels equaled or exceeded during 50 percent, 25 percent, 8 percent, and 2 percent of a stated time. Sound levels associated with the L_2 and L_8 typically describe transient or short-term events, while levels associated with the L_{50} describe the steady state (or median) noise conditions. While the L_{50} describes the median noise levels occurring 50 percent of the time, the L_{eq} accounts for the total energy (average) observed for the entire hour. Therefore, the L_{eq} noise descriptor is generally 1-2 dBA higher than the L_{50} noise level.

Peak hour or average noise levels, while useful, do not completely describe a given noise environment. Noise levels lower than peak hour may be disturbing if they occur during times when quiet is most desirable, namely evening and nighttime (sleeping) hours. To account for this, the Community Noise Equivalent Level (CNEL), representing a composite 24-hour noise level is utilized. The CNEL is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time-of-day corrections require the addition of 5 decibels to dBA L_{eq} sound levels in the evening from 7:00 p.m. to 10:00 p.m., and the addition of 10 decibels to dBA L_{eq} sound levels at night between 10:00 p.m. and 7:00 a.m. These additions are made to account for the noise sensitive time periods during the evening and night hours when sound appears louder. CNEL does not represent the actual sound level heard at any time, but rather represents the total sound exposure. The City of Los Alamitos relies on the 24-hour CNEL level to assess land use compatibility with transportation related noise sources.

Sound levels used for compliance modeling, sound level limitations on equipment, and product labeling use another descriptor, are known as the sound power level (Lw). Sound power is the rate at which sound energy is emitted from a source per unit time. Knowing the sound power level of a device allows for the objective comparison of the sound output of different devices, without any knowledge of the environment in which they were tested or the distance at which measurements were taken. This makes sound power levels ideal for verifying compliance with property line noise level limits.

2.3 SOUND PROPAGATION

When sound propagates over a distance, it changes in level and frequency content. The way noise reduces with distance depends on the following factors.

2.3.1 GEOMETRIC SPREADING

Sound from a localized source (i.e., a stationary point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Highways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources. Noise from a line source propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source. (9)

2.3.2 GROUND ABSORPTION

The propagation path of noise from a highway to a receptor is usually very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the attenuation associated with geometric spreading. Traditionally, the excess attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is usually sufficiently accurate for distances of less than 200 ft. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receptor, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receptor such as soft dirt, grass, or scattered bushes and trees), an excess ground attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the cylindrical spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance from a line source. (3)

2.3.3 ATMOSPHERIC EFFECTS

Receptors located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Sound levels can be increased at large distances (e.g., more than 500 feet) due to atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence can also have significant effects. (9)

2.3.4 SHIELDING

A large object or barrier in the path between a noise source and a receptor can substantially attenuate noise levels at the receptor. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Shielding by trees and other such vegetation typically only has an “out of sight, out of mind” effect. That is, the perception of noise impact tends to decrease when vegetation blocks the line-of-sight to nearby resident. However, for vegetation to provide a substantial, or even noticeable, noise reduction, the vegetation area must be at least 15 feet in height, 100 feet wide and dense enough to

completely obstruct the line-of sight between the source and the receiver. This size of vegetation may provide up to 5 dBA of noise reduction. The FHWA does not consider the planting of vegetation to be a noise abatement measure. (3)

2.4 NOISE CONTROL

Noise control is the process of obtaining an acceptable noise environment for an observation point or receptor by controlling the noise source, transmission path, receptor, or all three. This concept is known as the source-path-receptor concept. In general, noise control measures can be applied to these three elements.

2.5 NOISE BARRIER ATTENUATION

Effective noise barriers can reduce noise levels by 10 to 15 dBA, cutting the loudness of traffic noise in half. A noise barrier is most effective when placed close to the noise source or receptor. Noise barriers, however, do have limitations. For a noise barrier to work, it must be high enough and long enough to block the path of the noise source. (3)

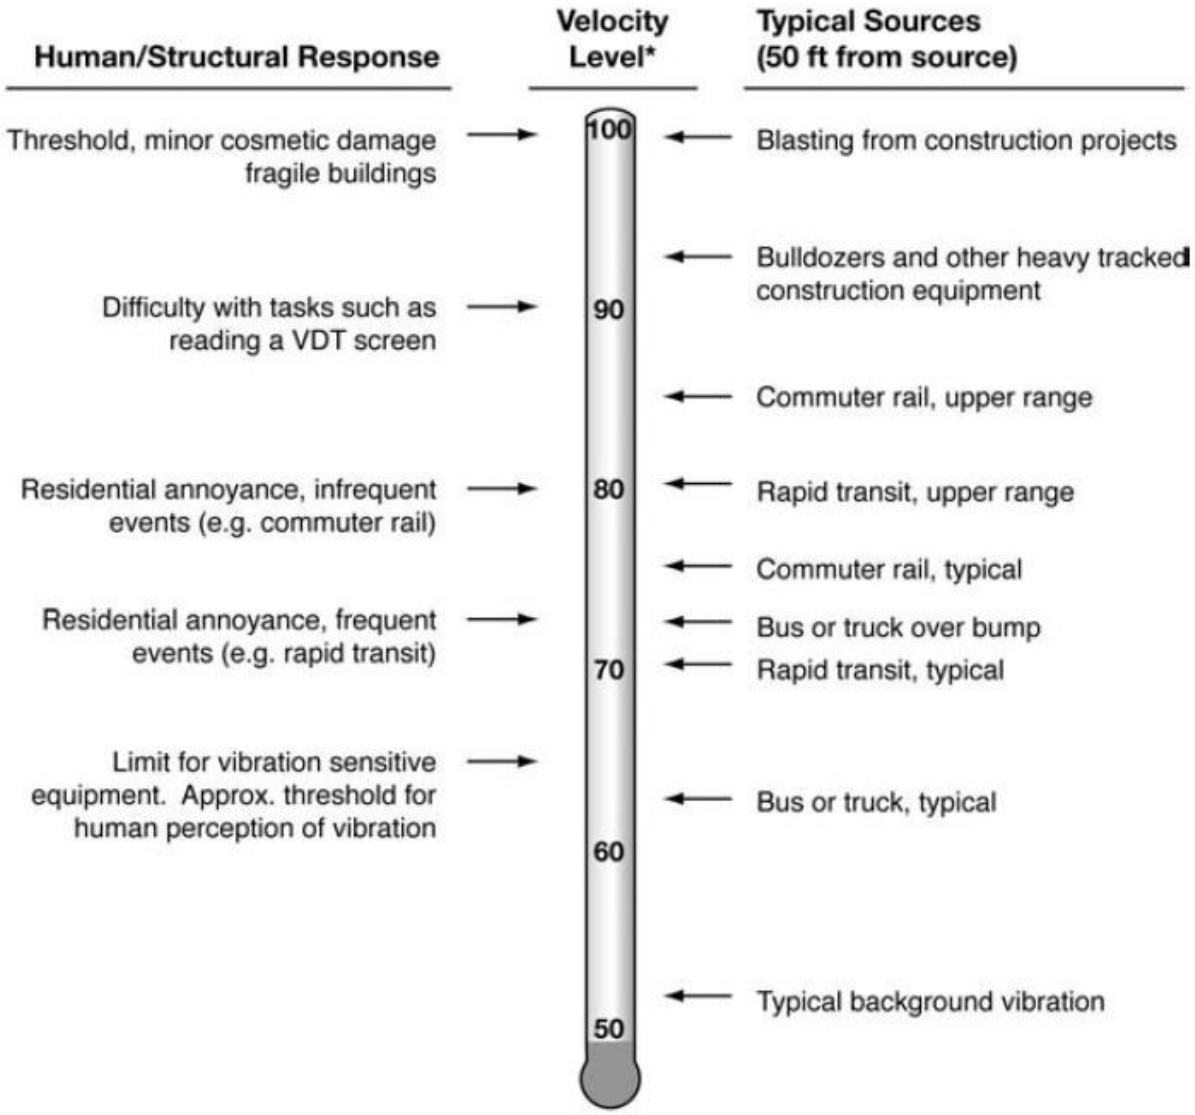
2.6 LAND USE COMPATIBILITY WITH NOISE

Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches, and residences are more sensitive to noise intrusion than are commercial or industrial developments and related activities. As ambient noise levels affect the perceived amenity or livability of a development, so too can the mismanagement of noise impacts impair the economic health and growth potential of a community by reducing the area's desirability as a place to live, shop and work. For this reason, land use compatibility with the noise environment is an important consideration in the planning and design process. The FHWA encourages State and Local government to regulate land development in such a way that noise-sensitive land uses are either prohibited from being located adjacent to a highway, or that the developments are planned, designed, and constructed in such a way that noise impacts are minimized. (10)

2.7 VIBRATION

Per the Federal Transit Administration (FTA) *Transit Noise and Vibration Impact Assessment Manual*, (7) vibration is the periodic oscillation of a medium or object. The rumbling sound caused by the vibration of room surfaces is called structure-borne noise. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, such as factory machinery, or transient, such as explosions. As is the case with airborne sound, ground-borne vibrations may be described by amplitude and frequency.

Additionally, in contrast to airborne noise, ground-borne vibration outdoors is not a common environmental problem and annoyance from ground-borne vibration is almost exclusively an indoor phenomenon. (7) Therefore, the effects of vibrations should only be evaluated at a structure and the effects of the building structure on the vibration should be considered. Wood-



frame buildings, such as typical residential structures, are more easily excited by ground vibration than heavier buildings. In contrast, large masonry buildings with spread footings have a low response to ground vibration. (7) In general, the heavier a building is, the lower the response will be to the incident vibration energy. However, all structurers reduce vibration levels due to the coupling of the building to the soil.

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. (7) The PPV is most frequently used to describe vibration impacts to buildings but is not always suitable for evaluating human response (annoyance) because it takes some time for the human body to respond to vibration signals. Instead, the human body responds to average vibration amplitude often described as the root mean square (RMS). The RMS amplitude is defined as the average of the squared amplitude of the signal and is most frequently used to describe the effect of vibration on the human body. (7) However, the RMS amplitude and PPV are related mathematically, and the RMS amplitude of equipment is typically calculated from the PPV reference level. The RMS amplitude is approximately 70% of the PPV (11). Thus, thus either can be used on the description of vibration impacts.

Vibration decibel notation (VdB) is another vibration notation developed and used by the FTA in their guidance manual to describe vibration levels and provide a background of common vibration levels and set vibration limits. (7) Decibel notation (VdB) serves to reduce the range of numbers used to describe vibration levels and is used in this report to describe vibration levels.

As stated in the FTA guidance manual, the background vibration-velocity level in residential areas is generally 50 VdB. Ground-borne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels. (7) Typical outdoor sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground-borne vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Exhibit 2-B illustrates common vibration sources and the human and structural response to ground-borne vibration.

EXHIBIT 2-B: TYPICAL LEVELS OF GROUND-BORNE VIBRATION

** RMS Vibration Velocity Level in VdB relative to 10^{-6} inches/second*

Source: Federal Transit Administration (FTA) Transit Noise Impact and Vibration Assessment.

3 REGULATORY SETTING

To limit population exposure to physically and/or psychologically damaging as well as intrusive noise levels, the federal government, the State of California, various county governments, and most municipalities in the state have established standards and ordinances to control noise. In most areas, automobile and truck traffic is the major source of environmental noise. Traffic activity generally produces an average sound level that remains constant with time. Air and rail traffic, and commercial and industrial activities are also major sources of noise in some areas. Federal, state, and local agencies regulate different aspects of environmental noise. Federal and state agencies generally set noise standards for mobile sources such as aircraft and motor vehicles, while regulation of stationary sources is left to local agencies.

3.1 STATE OF CALIFORNIA NOISE REQUIREMENTS

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires that each county and city adopt a General Plan that includes an element that addresses noise issues per guidelines adopted by the Governor's Office of Planning and Research. (12) The purpose of this element is to ensure a local planning area *limits the exposure of the community to excessive noise levels*. State law allows jurisdictions to organize their general plan in any format, including by consolidating elements. Here, noise issues are addressed in the City of Los Alamitos' Public Facilities and Safety Element of its General Plan. In addition, the California Environmental Quality Act (CEQA) requires that reasonably foreseeable environmental effects of a project be analyzed, including environmental noise impacts.

3.2 STATE OF CALIFORNIA BUILDING CODE

The State of California's Green Building Standards Code contains mandatory measures for non-residential building construction in Section 5.507 on Environmental Comfort. (13) These noise standards are applied to new construction in California for controlling interior noise levels resulting from exterior noise sources. The regulations specify that acoustical studies must be prepared when non-residential structures are developed in areas where a general plan or airport plan provide contours that show exterior noise levels exceed 65 dBA CNEL, such as within a noise level contour of an airport, freeway, or railroad; or if contours are unavailable, buildings exposed to a noise level of 65 dBA $L_{eq\text{-}1\text{-}hr}$ during any hour of operation; shall be constructed to provide an interior noise level environment attributable to exterior sources that does not exceed an hourly equivalent level of 50 dBA L_{eq} in occupied areas during any hour of operation.

3.3 CITY OF LOS ALAMITOS NOISE STANDARDS

The General Plan is a tool for managing noise by planning for and maintaining compatibility between sensitive land uses and noise sources. (14) The City of Los Alamitos has identified two separate types of noise sources: (1) transportation, and (2) stationary. To control transportation related noise sources such as arterial roads, freeways, airports, and railroads, the City of Los Alamitos has established guidelines for acceptable community noise levels in the Public Facilities

and Safety Element of the General Plan. Noise from stationary sources is regulated through specific standards in Chapter 17.20 of the Los Alamitos Municipal Code. and Division 6 of the Orange County Municipal Code (Rossmoor). The Public Facilities and Safety Element of the General Plan includes the following Noise Hazards goal and policies:

- Goal 4: An environment in which minimized noise contributes to the public's health, safety, and welfare.
- Policy 4.1 **Land use compatibility**. Approve development and require mitigation measures to ensure existing and future land use compatibility as shown in the City's Noise Ordinance, the Land Use and Noise Compatibility Matrix, the State Interior and Exterior Noise Standards, and the Airport Environs Land Use Plan for the JFTB.
- Policy 4.2 **New residential**. When new residential development is proposed adjacent to land designated for industrial or commercial uses, require the proposed development to assess potential noise impacts and fund feasible noise-related mitigation measures.
- Policy 4.3 **Control sound at the source**. Prioritize noise mitigation measures to control sound at the source over buffers, soundwalls, and other perimeter measures.
- Policy 4.4 **Noise impacts**. Minimize or eliminate persistent, periodic, or impulsive noise impacts of business operations.
- Policy 4.6 **Aircraft noise**. Work with the JFTB and Long Beach Airport to minimize the noise impact of small aircraft and helicopters on residential neighborhoods.

3.3.1 LAND USE COMPATIBILITY

The noise criteria identified in the City of Los Alamitos Public Facilities and Safety Element (Table 4) are guidelines to evaluate the land use compatibility of transportation-related noise. The compatibility criteria, shown on Exhibit 3-A, provides the City with a planning tool to gauge the compatibility of land uses relative to existing and future exterior noise levels.

The *Land Use and Noise Compatibility Matrix* describes categories of compatibility and not specific noise standards. The residential land uses of the Project are considered *clearly compatible* with unmitigated exterior noise levels of less than 60 dBA CNEL and *normally compatible* with unmitigated exterior noise levels approaching 70 dBA CNEL, *new construction or development should be undertaken only after detailed analysis of the noise reduction requirements are made and needed noise insulation features in the design are determined. Conventional construction, with closed windows and fresh air supply systems or air conditioning, will normally suffice.* For *normally incompatible* exterior noise levels, exceeding 70 dBA CNEL, *new construction or development should be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements are made and needed noise insulation features must be included in the design.*

EXHIBIT 3-A: LAND USE AND NOISE COMPATIBILITY MATRIX

LAND USES	EXISTING NOISE LEVEL (dBA CNEL)						
Example Land Uses	**<**	**55**	**60**	**65**	**70**	**75**	**80>**
Amphitheater, concert hall, auditorium, meeting hall	B	B	C	C	D	D	D
Mobile home	A	A	B	C	C	D	D
Hospital, library, school, faith/religious uses	A	A	B	C	C	D	D
Hotel, motel, transient lodging	A	A	B	B	C	C	D
Single family, multifamily, faith/religious uses	A	A	B	B	C	D	D
Parks	A	A	A	B	C	D	D
Office building, research & development, professional office, city office building, and hotel	A	A	A	B	B	C	D
Amusement park, miniature golf, go-cart track, health club, equestrian center	A	A	A	B	B	D	D
Golf courses, nature centers, cemeteries, wildlife reserves, wildlife habitat	A	A	A	A	B	C	C
Commercial retail, bank, restaurant, movie theater	A	A	A	A	B	B	C
Automobile service station, auto dealer, manufacturing, warehousing, wholesale, utilities	A	A	A	A	B	B	B
Agriculture	A	A	A	A	A	A	A

Notes:

Community Noise Equivalent Level (CNEL). The energy-average of the A-weighted sound levels during a 24-hour period, with 5 dB added to the levels from 7:00 PM to 10:00 PM and 10 dB added from 10:00 PM to 7:00 AM.

Compatibility Zones. The following zones indicate the degree to which listed land uses are compatible with noise levels shown in the table.

Zone A. Clearly Compatible. Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.

Zone B. Normally Compatible. New construction or development should be undertaken only after detailed analysis of the noise reduction requirements are made and needed noise insulation features in the design are determined. Conventional construction, with closed windows and fresh air supply systems or air conditioning, will normally suffice.

Zone C. Normally Incompatible. New construction or development should normally be discouraged. If new construction or development does proceed, a detailed analysis or noise reduction requirements must be made and needed noise insulation features must be included in the design.

Zone D. Clearly Incompatible. New construction or development should generally not be undertaken.

Source: City of Los Alamitos General Plan Public Facilities and Safety Element, Table 4.

3.3.2 CITY OF LOS ALAMITOS OPERATIONAL NOISE STANDARDS

To control transportation-related noise sources such as arterial roads, freeways, airports, and railroads, the City of Los Alamitos has established the standards provided in Table 4 of General Plan Public Facilities and Safety Element for compatible community noise levels.

To analyze noise impacts originating from a designated fixed location or private property such as the Project, stationary-source (operational) noise such as the expected roof-top and ground-mounted air conditioning units, parking lot vehicle movements, outdoor activity, and trash enclosure activities are typically evaluated against standards established under a City's Municipal Code. Table 3-1 summarizes the City of Los Alamitos Municipal Code, Section 17.20.050 exterior noise standards that may be received at nearby land use uses. The City of Los Alamitos noise ordinance is included in Appendix 3.1.

TABLE 3-1: LOS ALAMITOS MUNICIPAL CODE EXTERIOR NOISE STANDARDS

Noise District	Maximum Noise Level[1]	Time Period
1 (Residential) day	55 dB(A)	7:00 a.m. to 10:00 p.m.
1 (Residential) night	50 dB(A)	10:00 p.m. to 7:00 a.m.
2 (Professional and Institutional)	55 dB(A)	Anytime
3 (Commercial)	60 dB(A)	Anytime
4 (Industrial)	70 dB(A)	Anytime

Notes: The noise levels at the affected property shall not exceed:
-The noise standard for a cumulative period of more than 30 minutes in any hour; or
-The noise standard plus 5 dBA for a cumulative period of more than 15 minutes in any hour; or
-The noise standard plus 10 dBA for a cumulative period of more than 5 minutes in any hour; or
-The noise standard plus 15 dBA for a cumulative period of more than one minute in any hour; or
-The noise standard plus 20 dBA for any period of time.
[1] Los Alamitos Municipal Code Chapter 17.20.050, Noise. (Appendix 3.1).

3.4 CONSTRUCTION NOISE STANDARDS

To control noise impacts associated with the construction of the Project, noise from construction activities are typically limited to the hours of operation established under a City's Municipal Code. The City of Los Alamitos Municipal Code, Section 17.20.020, states that construction activities are exempted from the noise ordinance if it occurs between the hours of 7:00 a.m. to 8:00 p.m. on weekdays and on Saturdays. Construction is not allowed at any time on Sundays or Federal holidays. (15) Neither the City's General Plan nor Municipal Code establish numeric maximum acceptable construction source noise levels at potentially affected receivers for CEQA analysis purposes. Therefore, a numerical construction threshold based on Federal Transit Administration (FTA) *Transit Noise and Vibration Impact Assessment Manual* is used for analysis of daytime construction impacts, as discussed below.

According to the FTA, local noise ordinances are typically not very useful in evaluating construction noise. They usually relate to nuisance and hours of allowed activity, and sometimes specify limits in terms of maximum levels, but are generally not practical for assessing the impact of a construction project. Project construction noise criteria should account for the existing noise

environment, the absolute noise levels during construction activities, the duration of the construction, and the adjacent land use. Due to the lack of standardized construction noise thresholds, the FTA provides guidelines that can be considered reasonable criteria for construction noise assessment. The FTA considers a daytime exterior construction noise level of 80 dBA L_{eq} as a reasonable threshold for noise sensitive residential land use. (7 p. 179)

3.5 CONSTRUCTION VIBRATION STANDARDS

Construction activity can result in varying degrees of ground-borne vibration, depending on the equipment and methods used, distance to the affected structures and soil type. Construction vibration is generally associated with pile driving and rock blasting. Other construction equipment such as air compressors, light trucks, hydraulic loaders, etc., generates little or no ground vibration. Occasionally large bulldozers and loaded trucks can cause perceptible vibration levels at close proximity.

To analyze vibration impacts originating from the operation and construction of 4665 Lampson Avenue, vibration-generating activities are appropriately evaluated against standards established under a City's Municipal Code, if such standards exist. However, the City of Los Alamitos does not identify specific vibration level limits. Therefore, for analysis purposes, the Caltrans *Transportation and Construction Vibration Guidance Manual*, (11 p. 38) Table 19, vibration damage are used in this noise study to assess potential temporary construction-related impacts at adjacent building locations.

The construction vibration damage potential criteria include consideration of the building conditions. (8 p. 182) Table 3-2 describes the maximum acceptable transient and continuous vibration building damage potential levels by structure type and condition. The existing buildings adjacent to the Project site can best be described as "older residential structures" with a maximum acceptable continuous vibration threshold of 0.3 PPV (in/sec).

TABLE 3-2: BUILDING DAMAGE VIBRATION CRITERIA

Structure and Condition	Maximum Transient Vibration Levels PPV (in/sec)	Maximum Continuous Vibration Levels PPV (in/sec)
Extremely fragile historic buildings	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

Caltrans Transportation and Construction Vibration Guidance Manual, April 2020, Tables 19, p. 38.

3.6 AIRPORT LAND USE COMPATIBILITY

The JFTB Los Alamitos is located adjacent to, and northwest of the Project site. The Project site is located within the Airport Environs Land Use Plan Airport Planning Area (16).

Exhibit 3-B shows the Project site in relation to the airport's noise level contour boundaries, as provided by the *Airport Environs Land Use Plan (AELUP) for Joint Forces Training Base Los Alamitos* (16). The AELUP noise level contours are based on a 1987 U.S. Army Environmental Hygiene Agency (USAEHA) assessment that was published in 1994 as part of the *Air Installation Compatible Use Zone (AICUZ) Study, Armed Forces Reserve Center Los Alamitos Airfield* (17). The 1994 ACUIZ noise level contours were based on 55,000 aircraft operations. The noise level contours shown on Exhibit 3-B are a modified version of the 1994 ACUIZ Noise Level Contours published by the ALUC in 1995. Based on the AELUP noise level contours, shown on Exhibit 3-B, the majority of the Project site sits within the 60 dBA CNEL but outside the 65 dBA CNEL noise level contour boundary of the JFTB Los Alamitos.

Exhibit 3-C shows the Project site in relation to the airport's noise level contour boundaries, as more recently published in 2020 by the US Army Public Health Center in the *Noise Assessment for Los Alamitos Airfield, Joint Forces Training Base Los Alamitos* (18). The more recent 2020 noise level contours are based on 46,235 aircraft operations. As shown on Exhibit 3-C, a portion of the northwestern portion of the Project site is within the 60 dBA CNEL noise level contour boundary of the JFTB Los Alamitos.

This analysis relies on the more recent 2020 noise level contours developed by the US Army Public Health Center. The reliance on this more recent information is justified because the noise level contours included in the AELUP were originally established based on data collected almost four decades ago in 1987 as part of an earlier US Army USAEHA assessment published in 1994. The 2020 noise level contours reflect the most current data and analysis as to existing and projected noise environments at the Project site. In addition, the 2020 noise level contours were generated based on current background information using the Department of Defense aircraft noise model NoiseMap, which is a suite of computer programs and components developed by the US Air Force to predict noise exposure near an airfield/runway due to aircraft flight, maintenance, and ground run-up operations. The 1994 report was based on information available at that time related to airfield and heliport planning criteria, air installation compatible use zone study documents from other military installations, environmental noise assessments for the Los Alamitos Armed Forces Reserve Center, then-existing and proposed airfield operations, and other information. By comparison, the 2020 noise level contours are more current, reflecting more recent existing and proposed airfield operations as well as other information.

The noise criteria identified in the *Airport Environs Land Use Plan (AELUP) for Joint Forces Training Base Los Alamitos* (16) are guidelines to evaluate the land use compatibility of aircraft-related noise. The compatibility criteria, shown on Exhibit 3-D, provides a planning tool to gauge the compatibility of land uses relative to existing and future exterior noise levels. Residential land uses located outside the 60 dBA contour are considered normally consistent, residential land uses located within the 60 dBA contour are considered conditionally consistent and are required to

ensure that the interior CNEL does not exceed 45 dBA CNEL. Residential land uses located within the 65 dBA contour are considered normally inconsistent.

This is consistent with the City of Los Alamitos noise compatibility standards which states residential land uses exposed to noise levels ranging from 60-65 dBA CNEL are considered "Normally Compatible", and requires new construction or development to conduct a detailed analysis of the noise reduction requirements to verify any needed noise insulation features are included in the design. The City General Plan states, "conventional construction, with closed windows and fresh air supply systems or air conditioning, will normally suffice." Relative to noise from JFTB Los Alamitos, the General Plan states, "homes within the moderate noise impact zone (between 60 and 65 dBA CNEL) could be seriously disturbed by single noise events, but are still considered compatible by the AELUP."

EXHIBIT 3-B: AELUP AIRPORT NOISE LEVEL CONTOUR BOUNDARIES

EXHIBIT 3-C: APHC 2020 AIRPORT NOISE LEVEL CONTOUR BOUNDARIES

EXHIBIT 3-D: LIMITATIONS ON LAND USE DUE TO AIRCRAFT NOISE

TABLE 1

AIRPORT LAND USE COMMISSION FOR ORANGE COUNTY
AIRPORT ENVIRONS LAND USE PLAN
LIMITATIONS ON LAND USE DUE TO NOISE
(Applicable to Aircraft Noise Sources)

LAND USE CATEGORY	COMMUNITY NOISE EQUIVALENT LEVEL dB						
	55	60	65	70	75	80	
Residential (all types): Single and Multi-Family Residences							
Community Facilities: Churches, Libraries, Schools, Preschools, Day-Care Centers, Hospitals, Nursing/Convalescent Homes, & Other noise sensitive uses							
Commercial: Retail, Office							
Industrial:							

NORMALLY CONSISTENT

Conventional construction methods used. No special noise reduction requirements.

CONDITIONALLY CONSISTENT

Must use sound attenuation as required by the California Noise Insulation Standards, Title 25, California Code of Regulations. Residential use sound attenuation required to ensure that the interior CNEL does not exceed 45 dB. Commercial and industrial structures shall be sound attenuated to meet Noise Impact Zone "1" criteria (refer to Section 3.2.3).

NORMALLY INCONSISTENT

All residential units are inconsistent unless sound attenuated to ensure that the interior CNEL does not exceed 45 dB, and that all units are indoor oriented so as to preclude noise impingement on outdoor living areas.

4 SIGNIFICANCE CRITERIA

The following significance criteria are based on currently adopted guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (1) For the purposes of this report, impacts would be potentially significant if the Project results in or causes:

A. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

B. Generation of excessive ground-borne vibration or ground-borne noise levels?

C. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

While the City of Los Alamitos General Plan Guidelines provide direction on noise compatibility and establish noise standards by land use type that are sufficient to assess the significance of noise impacts, they do not define the levels at which increases are considered substantial for use under Threshold A. Similarly, the City of Los Alamitos General Plan Guidelines do not define the vibration levels at which temporary or constant vibrations are considered substantial for use under Threshold B. CEQA Appendix G Threshold C applies to nearby public and private airports, if any, and the Project's land use compatibility. Table 4-1 shows the significance criteria summary matrix.

4.1 NOISE LEVEL INCREASES (THRESHOLD A)

Noise level increases resulting from the Project are evaluated based on the Appendix G CEQA Guidelines described above at the closest sensitive receiver locations. Under CEQA, consideration must be given to the magnitude of the increase, the existing baseline ambient noise levels, and the location of noise-sensitive receivers to determine if a noise increase represents a significant environmental impact. This approach *recognizes that there is no single noise increase that renders the noise impact significant.* (19) This is primarily because of the wide variation in individual thresholds of annoyance and differing individual experiences with noise. Thus, an important way of determining a person's subjective reaction to a new noise is the comparison of it to the existing environment to which one has adapted—the so-called *ambient* environment.

In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will typically be judged. The Federal Interagency Committee on Noise (FICON) (20) developed guidance to be used for the assessment of project-generated increases in noise levels that consider the ambient noise level. The FICON recommendations are based on studies that relate aircraft noise levels to the percentage of persons highly annoyed by aircraft noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these recommendations are often used in environmental noise impact assessments involving the use of cumulative noise exposure metrics, such as the average-daily noise level (CNEL) and equivalent continuous noise level (L_{eq}).

The FICON guidance provides an established source of criteria to assess the impacts of substantial temporary or permanent increase in baseline ambient noise levels. Based on the FICON criteria, the amount to which a given noise level increase is considered acceptable is reduced when the without Project (baseline) noise levels are already shown to exceed certain land-use specific exterior noise level criteria. The specific levels are based on typical responses to noise level increases of 5 dBA or *readily perceptible*, 3 dBA or *barely perceptible*, and 1.5 dBA depending on the underlying without Project noise levels for noise-sensitive uses. These levels of increases and their perceived acceptance are consistent with guidance provided by both the Federal Highway Administration (3 p. 9) and Caltrans (21 p. 2_48).

4.2 VIBRATION (THRESHOLD B)

As described in Section 3.6 the vibration impacts originating from the construction of 4665 Lampson Avenue, vibration-generating activities are appropriately evaluated the thresholds of significance outlined in the Caltrans *Transportation and Construction Vibration Guidance Manual*, (11 p. 38). These guidelines identify the maximum acceptable continuous vibration building damage threshold of 0.3 PPV (in/sec) for "older residential structures" which is used in this noise study to assess potential impacts due to Project construction vibration levels.

4.3 AIRCRAFT/AIRPORT (THRESHOLD C)

The City provides policies regarding compatibility with JFTB Los Alamitos in Policy 4.1, Land use compatibility.

The noise compatibility criteria identified in the AELUP are guidelines to evaluate the land use compatibility of aircraft-related noise. The compatibility criteria, shown on Exhibit 3-D, indicates residential land uses exposed to noise levels less than 65 dBA CNEL are "normally consistent" and no special noise reduction requirements are identified. Residential land uses exposed to noise levels less than 70 dBA CNEL are considered "conditionally consistent" with the ALEUP and would be required to ensure that the interior CNEL does not exceed 45 dBA CNEL. For noise levels greater than 70 dBA CNEL, the ALUEP considers residential land use inconsistent, unless interior noise levels are reduced to 45 dBA CNEL and that all units are interior oriented to preclude impacts on exterior use areas. The ALEUP does not require any additional considerations for exterior locations exposed to noise levels below 70 dBA CNEL.

The AELUP compatibility criteria are generally consistent with the City of Los Alamitos General Plan Policy 4.1, where the residential land uses of the Project are considered *clearly compatible* with unmitigated exterior noise levels of less than 60 dBA CNEL and *normally compatible* with unmitigated exterior noise levels approaching 70 dBA CNEL, *new construction or development should be undertaken only after detailed analysis of the noise reduction requirements are made and needed noise insulation features in the design are determined. Conventional construction, with closed windows and fresh air supply systems or air conditioning, will normally suffice.* For *normally incompatible* exterior noise levels, exceeding 70 dBA CNEL, *new construction or development should be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements are made and needed noise insulation features must be included in the design.*

Therefore, for purposes of this analysis, exposure of exterior use areas to noise levels in excess of 70 dBA CNEL would be considered significant, and exposure of residential land uses to noise levels in excess of 65 dBA CNEL would be significant unless noise levels in interior habitable rooms are reduced to 45 dBA CNEL.

4.4 SIGNIFICANCE CRITERIA SUMMARY

Noise impacts shall be considered significant if any of the following occur as a direct result of the proposed development. Table 4-1 shows the significance criteria summary matrix that includes the allowable criteria used to identify potentially significant incremental noise level increases.

TABLE 4-1: SIGNIFICANCE CRITERIA SUMMARY

Analysis	Condition(s)	Significance Criteria	
		Daytime	Nighttime
On-Site Traffic[1]	Exterior Noise Level Criteria[1]	See Exhibit 3A	
	Interior Noise Level Standard[1]	45 dBA CNEL	
On-Site Aircraft[2]	Exterior Noise Level Criteria[1,2]	See Exhibits 3A and 3D	
	Interior Noise Level Standard[2]	45 dBA CNEL	
Off-Site Traffic[3]	If ambient is < 60 dBA CNEL[3]	≥ 5 dBA CNEL Project increase	
	If ambient is 60 - 65 dBA CNE[3]L	≥ 3 dBA CNEL Project increase	
	If ambient is > 65 dBA CNEL[3]	≥ 1.5 dBA CNEL Project increase	
Operational	Exterior Noise Level Standards[4]	55 dBA L_{eq}	50 dBA L_{eq}
	If ambient is < 60 dBA Leq[3]	≥ 5 dBA L_{eq} Project increase	
	If ambient is 60 - 65 dBA Leq[3]	≥ 3 dBA L_{eq} Project increase	
	If ambient is > 65 dBA Leq[3]	≥ 1.5 dBA L_{eq} Project increase	
Construction	Noise Level Threshold[5]	80 dBA L_{eq}	
	Vibration Level Threshold[6]	0.30 in/sec PPV

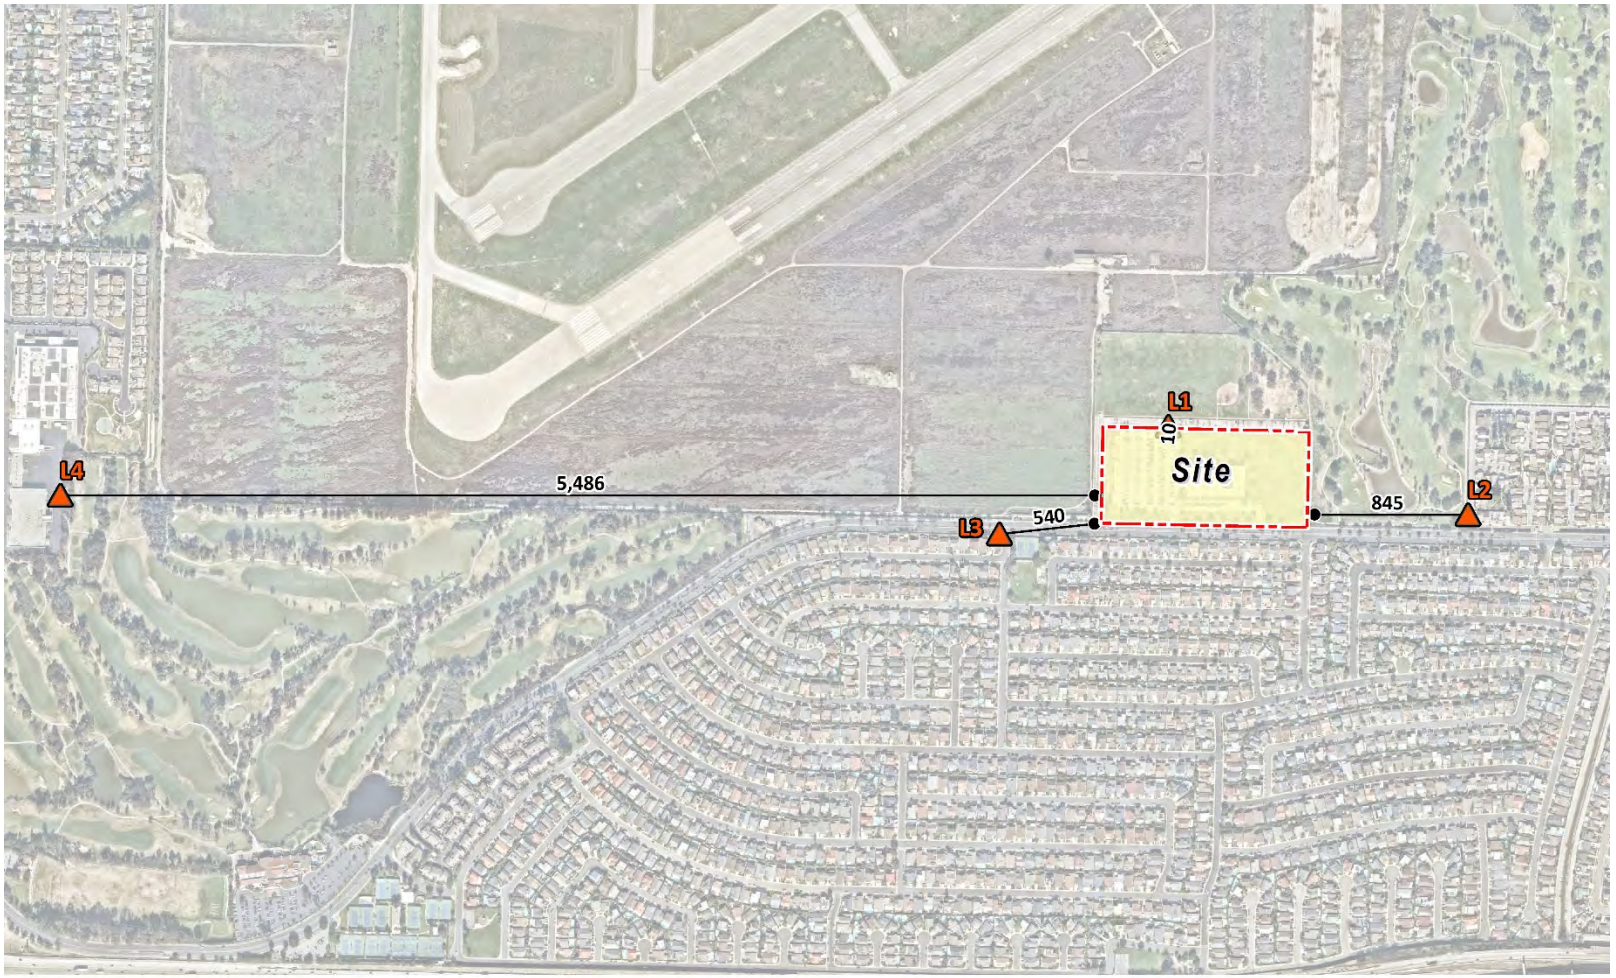
5 EXISTING NOISE LEVEL MEASUREMENTS

To assess the existing noise level environment, four 24-hour noise level measurements were taken at sensitive receiver locations in the Project study area. The receiver locations were selected to describe and document the existing noise environment within the Project study area. Exhibit 5-A provides the boundaries of the Project study area and the noise level measurement locations. To fully describe the existing noise conditions, noise level measurements were collected by Urban Crossroads, Inc. on Monday, May 23rd, 2022. Appendix 5.1 includes study area photos.



5.1 MEASUREMENT PROCEDURE AND CRITERIA

To describe the existing noise environment, the hourly noise levels were measured during typical weekday conditions over a 24-hour period. By collecting individual hourly noise level measurements, it is possible to describe the daytime and nighttime hourly noise levels and calculate the 24-hour CNEL. The long-term noise readings were recorded using Piccolo Type 2 integrating sound level meter and dataloggers. The Piccolo sound level meters were calibrated using a Larson-Davis calibrator, Model CAL 150. All noise meters were programmed in "slow" mode to record noise levels in "A" weighted form. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment satisfies the American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-2014/IEC 61672-1:2013. (22)

5.2 NOISE MEASUREMENT LOCATIONS

The long-term noise level measurements were positioned as close to the nearest sensitive receiver locations as possible to assess the existing ambient hourly noise levels surrounding the Project site. Actual measurement locations may be affected by location access, equipment security, and proximity to noise sources or solid objects that would affect the measurement and thus may be located at locations that have similar acoustic conditions as the desired locations. Both Caltrans and the FTA recognize that it is not reasonable to collect noise level measurements that can fully represent any part of a private yard, patio, deck, or balcony normally used for human activity when estimating impacts for new development projects. This is demonstrated in the Caltrans general site location guidelines which indicate that, *sites must be free of noise contamination by sources other than sources of interest. Avoid sites located near sources such as barking dogs, lawnmowers, pool pumps, and air conditioners unless it is the express intent of the analyst to measure these sources*. (9) Further, FTA guidance states, t*hat it is not necessary nor recommended that existing noise exposure be determined by measuring at every noise-sensitive location in the project area. Rather, the recommended approach is to characterize the noise environment for clusters of sites based on measurements or estimates at representative locations in the community*. (7)

EXHIBIT 5-A: AMBIENT NOISE MEASUREMENT LOCATIONS

Based on recommendations of Caltrans and the FTA, it is not necessary to collect measurements at each individual building or residence, because each measurement represents a group of locations that share acoustical equivalence. (7) In other words, the area represented by the measurement location shares similar shielding, terrain, and geometric relationship to the reference noise source as the receiver location. Receivers represent a location of noise sensitive areas and are used to estimate the future noise level impacts. Collecting reference ambient noise level measurements at the nearby sensitive receiver locations allows for a comparison of the before and after Project noise levels and is necessary to assess potential noise impacts due to the Project's contribution to the ambient noise levels.

5.3 NOISE MEASUREMENT RESULTS

The noise measurements presented below focus on the average or equivalent sound levels (L_{eq}). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. Table 5-1 identifies the hourly daytime (7:00 a.m. to 10:00 p.m.) and nighttime (10:00 p.m. to 7:00 a.m.) noise levels at each noise level measurement location. Appendix 5.2 provides a summary of the existing hourly ambient noise levels.

TABLE 5-1: 24 HOUR AMBIENT NOISE LEVEL MEASUREMENTS

Location[1]	Description	Energy Average Noise Level (dBA L_{eq})[2]	
		Daytime	Nighttime
L1	Located north of the Project site near Arbor Dog Park at 4665 Lampson Avenue.	49.9	42.4
L2	Located east of the Project site near single-family residence at 5001 Lunar Drive.	60.8	52.4
L3	Located southwest of the Project site near single-family residence at 4701 Ironwood Avenue.	68.7	60.7
L4	Located west of the Project site near Old Ranch Country Club Golf Course at 3901 Lampson Avenue.	56.5	55.1

[1] See Exhibit 5-A for the noise level measurement locations.
[2] Energy (logarithmic) average levels. The long-term 24-hour measurement worksheets are included in Appendix 5.2. "Daytime" = 7:00 a.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

Table 5-1 provides the (energy average) noise levels used to describe the daytime and nighttime ambient conditions. These daytime and nighttime energy average noise levels represent the average of all hourly noise levels observed during these time periods expressed as a single number. Appendix 5.2 provides summary worksheets of the noise levels for each hour as well as

the minimum, maximum, L_1, L_2, L_5, L_8, L_{25}, L_{50}, L_{90}, L_{95}, and L_{99} percentile noise levels observed during the daytime and nighttime periods.

The background ambient noise levels in the Project study area are dominated by the transportation-related noise associated with the arterial roadway network and the nearby community facility land uses, including but not limited to JFTB Los Alamitos, Navy Golf Course, and Arbor Park located adjacent to the northern, eastern, western Project site boundaries. This includes the auto and truck activities on Lampson Avenue adjacent to the Project site and near the noise level measurement locations. The 24-hour existing noise level measurements shown on Table 5-1 present the worst-case existing unmitigated ambient noise conditions.

6 TRAFFIC NOISE METHODS AND PROCEDURES

The following section outlines the methods and procedures used to estimate and analyze the future traffic noise environment. Consistent with the City of Los Alamitos General Plan Policies for residential land use, all transportation related noise levels are presented in terms of the 24-hour CNEL.

6.1 FHWA TRAFFIC NOISE PREDICTION MODEL

The estimated roadway noise impacts from vehicular traffic were calculated using a computer program that replicates the Federal Highway Administration (FHWA) Traffic Noise Prediction Model- FHWA-RD-77-108. (23) The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). In California the national REMELs are substituted with the California Vehicle Noise (Calveno) Emission Levels. (24) Adjustments are then made to the REMEL to account for: the roadway classification (e.g., collector, secondary, major or arterial), the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT), the travel speed, the percentages of automobiles, medium trucks, and heavy trucks in the traffic volume, the roadway grade, the angle of view (e.g., whether the roadway view is blocked), the site conditions ("hard" or "soft" relates to the absorption of the ground, pavement, or landscaping), and the percentage of total ADT which flows each hour throughout a 24-hour period.

6.1.2 ON-SITE TRAFFIC NOISE PREDICTION MODEL INPUTS

The on-site roadway parameters including the average daily traffic (ADT) volumes used for this study are presented on Table 6-1. Although the Project site is located within the City of Los Alamitos, the majority of the roadways lies within the City of Seal Beach. Based on the City of Seal Beach General Plan Circulation Element, Lampson Avenue is classified as 4-lane Secondary Arterial. (25) Future average daily traffic volumes needed to assess the future on-site traffic noise environment and to identify the appropriate noise abatement measures that address the worst-case future noise conditions, shown on Table 6-1, were obtained from the 4665 Lampson Avenue Traffic Analysis prepared by Urban Crossroads on February 3, 2023 (6). The vehicle speed is based on the posted speed limit for Lampson Avenue. Soft site conditions were used to analyze the traffic noise impacts within the Project study area which account for the sound propagation loss over natural surfaces such as normal earth and ground vegetation. Research conducted by Caltrans has shown that due to the mix of ground types in actual situations, the hard site condition over predicted traffic noise levels and the use of soft site conditions is more appropriate for the application of the FHWA traffic noise prediction model . (26)

TABLE 6-1: ON SITE ROADWAY PARAMATERS

Roadway Segment	Lanes	Classification[1]	Roadway Capacity Volume[1]	Speed Limit (mph)[2]	Site Conditions
Lampson Avenue	4	Secondary Arterial	15,150	45	Soft

[2] Posted speed limits.

Table 6-2 presents the time-of-day vehicle splits by vehicle type, and Table 6-3 presents the total traffic flow distributions (vehicle mixes) used for this analysis. The vehicle mix provides the hourly distribution percentages of automobile, medium trucks, and heavy trucks for input into the FHWA Model based on roadway types. To predict the future noise environment at each building within the Project site, coordinate information was collected to identify the noise transmission path between the noise source and receiver. The coordinate information is based on the Project site plan showing the plotting of each Project building in relationship to Lampson Avenue, as shown in Exhibit 1-B and in Appendix 6.1.

TABLE 6-2: TIME OF DAY VEHICLE SPLITS

Time Period	Vehicle Type		
	Autos	Medium Trucks	Heavy Trucks
Daytime (7:00 a.m. - 7:00 p.m.)	77.5%	84.8%	86.5%
Evening (7:00 p.m. - 10:00 p.m.)	12.9%	4.9%	2.7%
Nighttime (10:00 p.m. - 7:00 a.m.)	9.6%	10.3%	10.8%
Total:	100.0%	100.0%	100.0%

6.1.2 OFF-SITE TRAFFIC NOISE PREDICTION MODEL INPUTS

Table 6-4 presents the roadway parameters used to assess the Project's off-site transportation noise impacts for Existing, Opening Year (2026) and General Plan Buildout (2045) Conditions, with and without Project Conditions. Table 6-4 identifies the fourteen (14) study area roadway segments, the distance from the centerline to adjacent land use based on the functional roadway classifications per the City of Los Alamitos General Plan Circulation Element, and the posted vehicle speeds.

TABLE 6-4: OFF-SITE ROADWAY PARAMETERS

7 ON-SITE TRAFFIC NOISE IMPACTS

An on-site exterior traffic noise impact analysis has been completed to determine the noise exposure levels that would result from adjacent traffic noise sources in the Project study area, and to identify potential noise abatement measures for the proposed Project that would achieve acceptable Project exterior and interior noise levels in compliance with the City of Los Alamitos land use and noise compatibility policies. The primary source of traffic noise affecting the Project site is from Lampson Avenue. The Project will also experience some background traffic noise from the Project's internal local streets, however, due to low traffic volume/speed, traffic noise from these roads will not make a significant contribution to the noise environment.

7.1 ON-SITE EXTERIOR TRAFFIC NOISE ANALYSIS

Using the FHWA and FTA noise prediction methodologies and the parameters outlined in Tables 6-1 thru 6-3, the expected future exterior noise levels at the Project buildings facing Lampson Avenue were calculated. Table 8-1 presents a summary of future exterior noise levels at the building façade of each floor. The on-site traffic noise level impacts indicate that noise levels at the Project buildings adjacent to Lampson Avenue would experience unmitigated exterior noise levels of ranging from 64.6 to 72.8 dBA CNEL. The on-site traffic noise analysis calculations are provided in Appendix 7.1.

To satisfy the City of Los Alamitos normally acceptable exterior noise level standard for residential land uses construction of a seven-foot-high noise barrier along Lampson Avenue, as shown on the Exhibit ES-A. With construction of this barrier, common outdoor activity areas with exposure to Lampson Avenue traffic noise would be exposed to noise levels less than 65 dBA CNEL which would satisfy the City of Los Alamitos clearly acceptable exterior noise level standard for multi-family residential land uses. With the proposed noise barrier shown on Exhibit ES-A, the future exterior noise levels at the single-family backyards and multi-family common outdoor activity areas will range from 58.3 to 63.6 dBA CNEL. This noise analysis shows that the recommended noise barrier will satisfy the City of Los Alamitos normally acceptable exterior noise level standard for single-family and clearly acceptable exterior noise level standard for multi-family residential land uses.

TABLE 7-1: EXTERIOR NOISE LEVELS (DBA CNEL)

Receiver Location (Land Use Type)	Source	Unmitigated Noise Level (dBA CNEL)	Mitigated Noise Level (dBA CNEL)	Barrier Height (Feet)	Land Use Compatibility[3]
Apartments	Lampson Avenue	72.8	63.8	7.0	Clearly Acceptable
Single Family	Lampson Avenue	72.8	63.8	7.0	Clearly Acceptable
Park	Lampson Avenue	64.6	58.3	7.0	Clearly Acceptable

[1] Exterior noise level calculations are included in Appendix 7.1.
[2] Barrier heights are based on the Project site plan included in Appendix 6.1.
[3] City of Los Alamitos General Plan Public Facilities and Safety Element (Table 4).

7.2 ON-SITE INTERIOR TRAFFIC NOISE ANALYSIS

To ensure that the interior traffic noise levels comply with the City of Los Alamitos interior noise level standards, future noise levels were calculated at the first and second-floor building facades.

7.2.1 NOISE REDUCTION METHODOLOGY

The interior noise level is the difference between the predicted exterior noise level at the building facade and the noise reduction of the structure. Typical building construction will provide a Noise Reduction (NR) of approximately 12 dBA with "windows open" and a minimum 25 dBA noise reduction with "windows closed." However, sound leaks, cracks and openings within the window assembly can greatly diminish its effectiveness in reducing noise. Several methods are used to improve interior noise reduction, including: (1) weather-stripped solid core exterior doors; (2) upgraded dual glazed windows; (3) mechanical ventilation/air conditioning; and (4) exterior wall/roof assembles free of cut outs or openings.

7.2.2 INTERIOR NOISE LEVEL ASSESSMENT

It is our understanding that the Project will provide mechanical ventilation (e.g. air conditioning) in all units. Therefore, Tables 7-2 and 7-3 present interior noise levels based on a windows-closed condition. Table 7-2 shows that the future noise levels at the first-floor building façades adjacent to Lampson Avenue are estimated to be 63.6 dBA CNEL with interior noise levels of 38.6 dBA CNEL. The first-floor interior noise level analysis shows that the City of Los Alamitos 45 dBA CNEL interior noise standards can be satisfied using standard construction for all first-floor units. The on-site traffic interior noise analysis calculations are provided in Appendix 7.1.

TABLE 7-2: FIRST FLOOR INTERIOR TRAFFIC NOISE LEVELS

Receiver Location (Land Use Type)	Noise Level at Façade[1]	Required Interior NR[2]	Estimated Interior NR[3]	Upgraded Windows[4]	Interior Noise Level[5]	Threshold	Threshold Exceeded?
Apartments	63.6	18.6	25.0	No	38.6	45	No
Single Family	63.6	18.6	25.0	No	38.6	45	No

[1] Exterior noise level at the facade with a windows closed condition requiring a means of mechanical ventilation (e.g. air conditioning).
[2] Noise reduction required to satisfy the 45 dBA CNEL interior noise standards.
[3] Estimated minimum interior noise reduction.
[4] Does the required interior noise reduction trigger upgraded with a minimum STC rating of greater than 27?
[5] Estimated interior noise level with minimum STC rating for all windows.
"NR" = Noise reduction

Table 7-3 shows the future noise levels at the second-floor building façades adjacent to Lampson Avenue are estimated to be 71.3 dBA CNEL with interior noise levels of 46.3 dBA CNEL. Based on the second-floor interior noise level analysis, to comply with the City of Los Alamitos 45 dBA CNEL interior noise standards second floor units and habitable rooms would require windows with an STC rating of 29.

TABLE 7-3: SECOND FLOOR INTERIOR TRAFFIC NOISE LEVELS

Receiver Location (Land Use Type)	Noise Level at Façade[1]	Required Interior NR[2]	Estimated Interior NR[3]	Upgraded Windows[4]	Interior Noise Level[5]	Threshold	Threshold Exceeded?
Apartments	71.3	26.3	25.0	No	46.3	45	Yes
Single Family	71.3	26.3	25.0	No	46.3	45	Yes

[1] Exterior noise level at the facade with a windows closed condition requiring a means of mechanical ventilation (e.g. air conditioning).
[2] Noise reduction required to satisfy the 45 dBA CNEL interior noise standards.
[3] Estimated minimum interior noise reduction.
[4] Does the required interior noise reduction trigger upgraded with a minimum STC rating of greater than 27?
[5] Estimated interior noise level with minimum STC rating for all windows.
"NR" = Noise reduction

This page intentionally left blank

8 OFF-SITE TRAFFIC NOISE IMPACTS

To assess the off-site traffic CNEL noise level impacts associated with development of the proposed Project, noise level contours were developed based on *4665 Lampson Avenue Traffic Impact Analysis.* (6) Noise level contour boundaries represent the equal levels of noise exposure and are measured in CNEL from the center of the roadway. Noise level contours were developed for the following traffic scenarios:

- Existing Conditions (2023): This scenario refers to existing traffic conditions.
- Existing Plus Project Conditions (2023+P): This scenario refers to existing traffic conditions plus project traffic increases.
- Opening Year (2026) Conditions (OY 2026): This scenario includes Existing traffic volumes plus an ambient growth factor of 8.24% plus traffic from pending and approved but not yet constructed known development projects in the area.
- Opening Year (2026) Plus Project Conditions (OY 2026+P): This scenario includes Opening Year Cumulative (2026) Without Project volumes plus Project traffic increases.
- General Plan Buildout (2045) Without Project Conditions (GBPO): This scenario includes Existing traffic volumes plus an ambient growth factor of 14% plus traffic from pending and approved but not yet constructed known development projects in the area.
- General Plan Buildout (2045) With Project Conditions (GBPO+P): This scenario includes General Plan Buildout Without Project volumes plus Project traffic increases.

8.1 TRAFFIC NOISE LEVEL CONTOURS

Noise contours were used to assess the Project's incremental 24-hour dBA CNEL traffic-related noise impacts at land uses adjacent to roadways conveying Project traffic. The noise contours represent the distance to noise levels of a constant value and are measured from the center of the roadway for the 70, 65, and 60 dBA CNEL noise levels. The noise contours do not consider the effect of any existing noise barriers or topography that may attenuate ambient noise levels. In addition, because the noise contours reflect modeling of vehicular noise on area roadways, they appropriately do not reflect noise contributions from the surrounding stationary noise sources within the Project study area.

Tables 8-1 through 8-6 present a summary of the exterior dBA CNEL traffic noise levels. Roadway segments are analyzed in each of the following timeframes: Existing, Opening Year 2022 with and without Project Buildout, General Plan Buildout (2045) with and without Project conditions. Appendix 8.1 includes a summary of the dBA CNEL traffic noise level contours for each of the traffic scenarios.

TABLE 8-1: EXISTING 2023 WITHOUT PROJECT CONDITIONS NOISE LEVEL CONTOURS

8.2 EXISTING 2023 CONDITION PROJECT TRAFFIC NOISE LEVELS

Table 8-1 presents the Existing 2023 without Project conditions CNEL noise levels, which are expected to range from 68.9 to 71.6 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 8-2 shows the Existing 2023 with Project conditions will range from 69.0 to 71.8 dBA CNEL. As shown on Table 8-7 the Existing 2023 with Project will generate a noise level increase of up to 0.3 dBA CNEL on the study area roadway segments. Based on the significance criteria in Section 4.2 for off-site traffic noise impacts, the Project-related noise level increases are considered less than significant under Existing 2023 conditions at the land uses adjacent to roadways conveying Project traffic.

8.3 OY 2026 TRAFFIC NOISE LEVEL INCREASES

Table 8-3 presents the OY 2026 without Project conditions CNEL noise levels, which are expected to range from 69.6 to 72.6 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 8-4 shows the OY 2026 with Project conditions will range from 69.7 to 72.8 dBA CNEL. Table 8-8 shows that the OY 2026 Project off-site traffic noise level increases of up to 0.3 dBA CNEL. Based on the significance criteria for off-site traffic noise presented in Section 4.2 for off-site traffic noise impacts, land uses adjacent to the study area roadway segments would experience *less than significant* noise level increases due to unmitigated OY 2026 Project-related traffic noise levels.

8.4 GPBO 2045 TRAFFIC NOISE LEVEL INCREASES

Table 8-5 presents the GPBO 2045 without Project conditions CNEL noise levels, which are expected to range from 70.1 to 73.0 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 8-6 shows the GPBO 2045 with Project conditions will range from 70.1 to 73.2 dBA CNEL. Table 8-9 shows that the GPBO 2045 Project off-site traffic noise level increases of up to 0.2 dBA CNEL. Based on the significance criteria for off-site traffic noise presented in Section 4.2 for off-site traffic noise impacts, land uses adjacent to the study area roadway segments would experience *less than significant* noise level increases due to unmitigated GPBO 2045 Project-related traffic noise levels.

8.5 CUMULATIVE TRAFFIC NOISE LEVEL INCREASES

Table 8-10 shows that the Project off-site contribution to cumulative traffic noise level increases range from less than 0.1 to 0.2 dBA CNEL. Based on the significance criteria for off-site traffic noise presented in Section 4.2 for off-site traffic noise impacts, land uses adjacent to the study area roadway segments would not experience substantial noise level increases due to Project-related traffic noise level increases and would be considered a *less than significant impact*.

9 RECEIVER LOCATIONS

To assess the potential for long-term operational and short-term construction noise impacts, the following sensitive receiver locations, as shown on Exhibit 9-A, were identified as representative locations for analysis. Receiver locations are modeled points used to assess impacts. The measurements shown on Exhibit 9-A are representative of receiver locations, because not all receiver locations are accessible (e.g., located on private property, unable to physically access, etc.) Thus, the receiver locations were chosen to be acoustically representative or similar in nature.

Sensitive receivers are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land. Noise-sensitive land uses are generally considered to include schools, hospitals, single-family dwellings, mobile home parks, churches, libraries, and recreation areas. Moderately noise-sensitive land uses typically include multi-family dwellings, hotels, motels, dormitories, out-patient clinics, cemeteries, golf courses, country clubs, athletic/tennis clubs, and equestrian clubs. Land uses that are considered relatively insensitive to noise include business, commercial, and professional developments. Land uses that are typically not affected by noise include: industrial, manufacturing, utilities, agriculture, undeveloped land, parking lots, warehousing, liquid and solid waste facilities, salvage yards, and transit terminals.

To describe the potential off-site Project noise levels, four representative receiver locations in the vicinity of the Project site were identified. All distances are measured from the Project site boundary to the outdoor living areas (e.g., private backyards) or at the building façade, whichever is closer to the Project site. The selection of receiver locations is based on FHWA guidelines and is consistent with additional guidance provided by Caltrans and the FTA, as previously described in Section 5.2. Other sensitive land uses in the Project study area that are located at greater distances than those identified in this noise study will experience lower noise levels than those presented in this report due to the additional attenuation from distance and the shielding of intervening structures. Distance is measured in a straight line from the project boundary to each receiver location.

R1: Location R1 represents existing noise sensitive Arbor Dog Park at 4665 Lampson Avenue, approximately 173 feet north of the Project site. Receiver R1 is placed at the Park's open space. A 24-hour noise measurement was taken near this location, L1, to describe the existing ambient noise environment.

R2: Location R2 represents the existing noise sensitive residence at 12462 Lunar Drive, approximately 887 feet east of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receiver R2 is placed at the building façade. A 24-hour noise measurement was taken near this location, L2, to describe the existing ambient noise environment.

R3: Location R3 represents the existing noise sensitive residence at 4625 Ironwood Avenue, approximately 82 feet south of the Project site. Receiver R3 is placed at the private outdoor living areas (backyards) facing the Project site. A 24-hour noise measurement was taken near this location, L3, to describe the existing ambient noise environment.

R4: Location R4 represents the existing noise sensitive residence at 12322 Provincetown Street, approximately 5,046 feet west of the Project site. Receiver R4 is placed at the private outdoor living areas (backyards) facing the Project site.

EXHIBIT 9-A: RECEIVER LOCATIONS

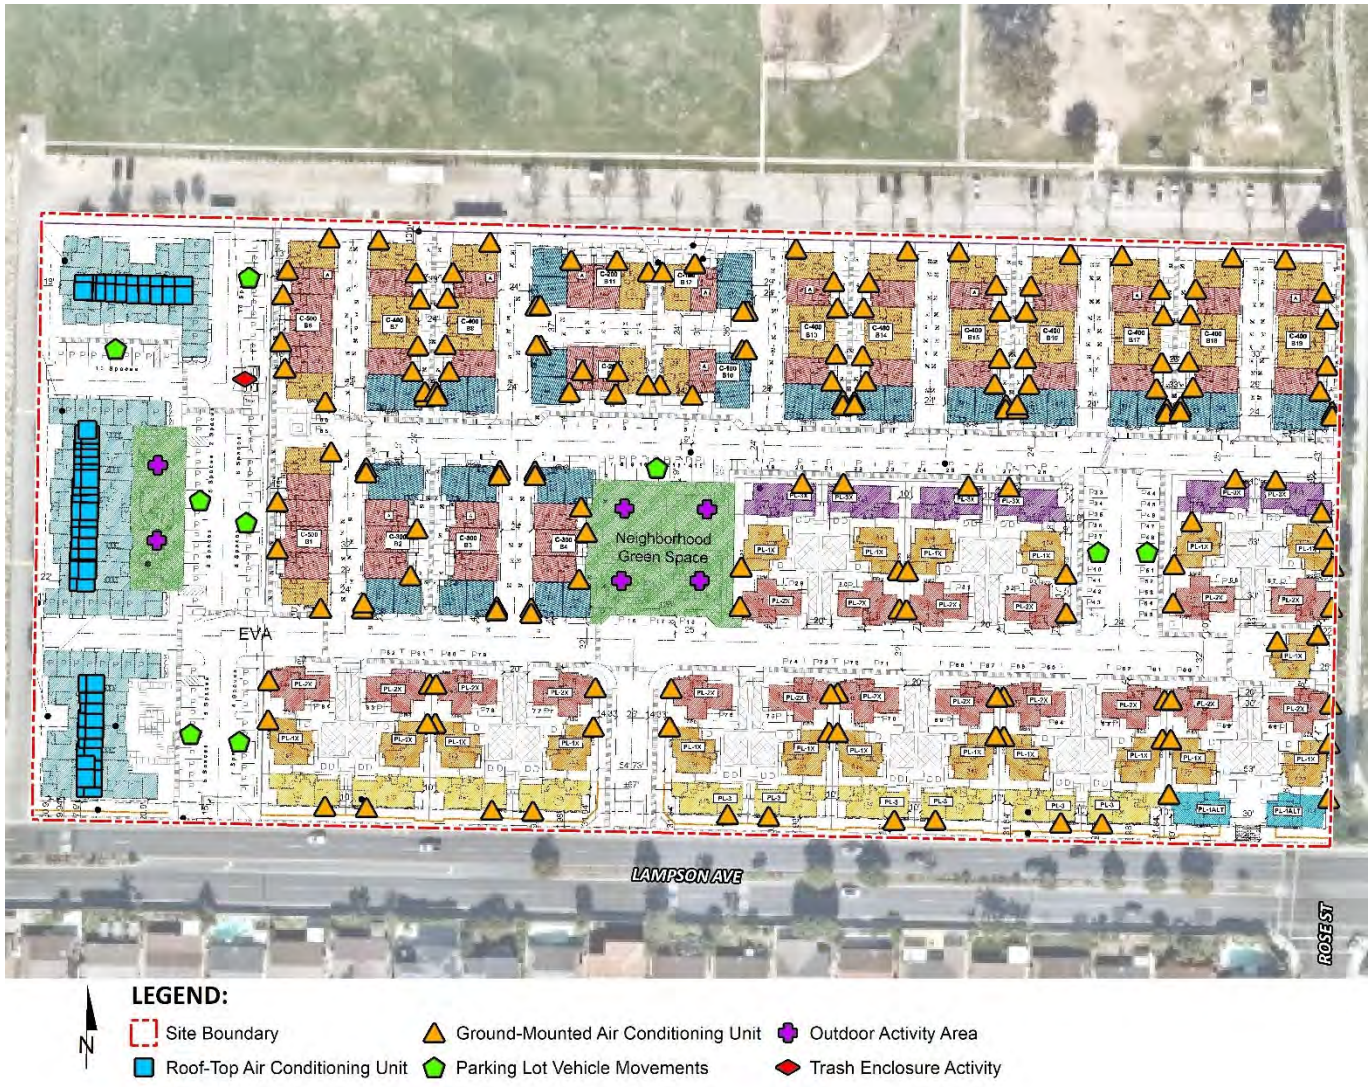
This page intentionally left blank

10 OPERATIONAL NOISE IMPACTS

This section analyzes the potential stationary-source operational noise impacts at the nearest receiver locations, identified in Section 9, resulting from the operation of the proposed 4665 Lampson Avenue Project. Exhibit 10-A identifies the representative noise source locations used to assess the operational noise levels. This section analyzes the potential operational noise impacts resulting from the operation of roof-top and ground-mounted air conditioning units, parking lot vehicle movements, outdoor activity, and trash enclosure activities associated with the Project.

10.1 OPERATIONAL NOISE SOURCES

This operational noise analysis is intended to describe noise level impacts associated with the expected typical of daytime and nighttime activities at the Project site. The proposed residential development is not expected to include any specific type of operational noise levels beyond the typical noise sources associated with residential land uses in the Project study area. However, to present a conservative approach, on-site Project-only operational noise sources are analyzed in this noise study and are expected to include: roof-top and ground-mounted air conditioning units, parking lot vehicle movements, outdoor activity, and trash enclosure activities.



AIR CONDITIONING UNITS

To assess the noise levels created by the roof-top and ground-mounted air conditioning units, reference noise levels were taken from equipment specifications for a 3- to 5-ton residential packaged air conditioning unit (Carrier 24ABC6). The air conditioning units were modeled as operating 45 minutes per hour during the daytime and 30 minutes at nighttime, which represents the typical maximum operating time for properly sized AC systems. For this noise analysis, 77 air conditioning units are expected to be located on the roof of the proposed affordable apartment buildings and 169 ground-mounted air conditioning units are located adjacent to single family detached residential units (cluster homes) and multifamily units (low-rise), as indicated on the Project site plan. The roof-top air conditioning units are anticipated to be located 3 feet above the roof and ground. At a uniform reference distance of 50 feet the units would generate a reference noise level of 44.4 dBA L_{eq}.

PARKING LOT ACTIVITIES

To determine the noise levels associated with parking lot vehicle movements, Urban Crossroads collected reference noise level measurements over a 24-hour period, at the parking lot for the Panasonic Avionics Corporation in the City of Lake Forest. The peak hour of activity measured over the 24-hour noise level measurement period occurred between 12:00 p.m. to 1:00 p.m., or the typical lunch hour for employees working in the area. The measured reference noise level at 50 feet from parking lot vehicle movements was measured at 56.2 dBA L_{eq}. The parking lot noise levels are mainly due to cars pulling in and out of spaces during peak lunch hour activity and employees talking. Noise associated with parking lot vehicle movements is expected to operate for the entire hour (60 minutes).

EXHIBIT 10-A: OPERATIONAL NOISE SOURCE LOCATIONS

OUTDOOR ACTIVITY AREAS

To describe the outdoor common area courtyards activity areas, a reference noise level measurement was taken by Urban Crossroads, Inc, at Washington Street Park in the City of Escondido. The 4.5-acre park was active during the measurement, and included a gazebo for gathering/parties, picnic tables, restrooms, two half-court basketball courts, two age-appropriate children's playgrounds, game tables, and walking paths. At 50 feet, the reference noise level is 59.9 dBA L_{eq} at a noise source height of 5 feet. The reference noise level measurement includes outdoor eating, drinking, with patrons laughing and talking. Outdoor activities are limited to the daytime hours.

TRASH ENCLOSURE ACTIVITY

To describe the noise levels associated with a trash enclosure activity, Urban Crossroads collected a reference noise level measurement at an existing trash enclosure containing two dumpster bins, at the at the Old Town West Parking structure in the City of Orange. The trash enclosure noise levels describe metal gates opening and closing, metal scraping against concrete floor sounds, dumpster movement on metal wheels, trash dropping into the metal dumpster. The reference noise levels describe trash enclosure noise activities when trash is dropped into an empty metal dumpster, as would occur at the Project site. The measured reference noise level at the uniform 50-foot reference distance is 72.7 dBA L_{max} and 57.4 dBA L_{eq} for the trash enclosure activity. The reference noise level describes the expected noise source activities associated with the trash enclosures for each of the Project buildings. Typical trash enclosure activities are estimated to occur for 10 minutes per hour.

10.2 REFERENCE NOISE LEVELS

To estimate the operational noise impacts, reference noise level measurements were collected from similar types of activities to represent the noise levels expected with the development of the proposed Project. While sound pressure levels (e.g., L_{eq}) quantify in decibels the intensity of given sound sources at a reference distance, sound power levels (L_w) are connected to the sound source and are independent of distance. Sound pressure levels vary substantially with distance from the source and diminish because of intervening obstacles and barriers, air absorption, wind, and other factors. Sound power is the acoustical energy emitted by the sound source and is an absolute value that is not affected by the environment. The reference project operational noise levels are based on the Project related noise sources shown on Exhibit 10-A. The reference Project operational sound power levels are summarized in Table 10-1.

TABLE 10-1: REFERENCE NOISE LEVELS

Noise Source	Noise Source Height (Feet)	Min./Hour[2]		Reference Noise Level (dBA L_{eq})		Sound Power Level (dBA)[6]
		Day	Night	@ Ref. Dist.	@ 50 Feet	
Air Conditioning Units[1]	5'	60	60	77.2	44.4	76.0
Parking Lot Movements	5'	60	60	66.6	56.1	87.8
Outdoor Activity	5'	60	0	62.8	59.9	91.5
Trash Enclosure Activity	5'	10	10	72.7	57.4	89.0

[1] Carrier 25HBC5 air conditioning unit assumed for ground-mounted and roof-top units, see Appendix 10.1.
[2] Anticipated duration (minutes within the hour) of noise activity during typical hourly conditions expected at the Project site. "Daytime" = 7:00 a.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

10.3 CADNAA NOISE PREDICTION MODEL

To fully describe the exterior operational noise levels from the Project, Urban Crossroads, Inc. developed a noise prediction model using the CadnaA (Computer Aided Noise Abatement) computer program. CadnaA can analyze multiple types of noise sources using the spatially accurate Project site plan, georeferenced Nearmap aerial imagery, topography, buildings, and barriers in its calculations to predict outdoor noise levels.

Using the ISO 9613 protocol, CadnaA will calculate the distance from each noise source to the noise receiver locations, using the ground absorption, distance, and barrier/building attenuation inputs to provide a summary of noise level at each receiver and the partial noise level contributions by noise source. Consistent with the ISO 9613 protocol, the CadnaA noise prediction model relies on the reference sound power level (L_w) to describe individual noise sources. While sound pressure levels (e.g., L_{eq}) quantify in decibels the intensity of given sound sources at a reference distance, sound power levels (L_w) are connected to the sound source and are independent of distance. Sound pressure levels vary substantially with distance from the source and diminish because of intervening obstacles and barriers, air absorption, wind, and other factors. Sound power is the acoustical energy emitted by the sound source and is an absolute value that is not affected by the environment.

The operational noise level calculations provided in this noise study account for the distance attenuation provided due to geometric spreading, when sound from a localized stationary source (i.e., a point source) propagates uniformly outward in a spherical pattern. A default ground attenuation factor of 0.5 was used in the noise analysis to account for mixed ground representing a combination of hard and soft surfaces. Appendix 10.2 includes the detailed noise model inputs used to estimate the Project operational noise levels presented in this section.

10.4 PROJECT OPERATIONAL NOISE LEVELS

Using the reference noise levels to represent the proposed Project operations that include trash enclosure activity, air conditioning, a loading dock, and parking lot activity, Urban Crossroads, Inc. calculated the unmitigated operational source noise levels that are expected to be generated

at the Project site and the Project-related noise level increases that would be experienced at each of the sensitive receiver locations. Table 10-2 shows the Project operational daytime noise levels. The hourly noise levels at the off-site receiver locations are expected to range from 18.9 to 48.4 dBA L_{eq}. Appendix 10.2 includes the detailed noise model inputs used to estimate the Project operational noise levels presented in this section.

TABLE 10-2: PROJECT DAYTIME OPERATIONAL NOISE LEVELS

Noise Source[1]	Operational Noise Levels by Receiver Location (dBA L_{max})			
	R1	R2	R3	R4
Air Conditioning Units	40.8	30.8	42.5	16.3
Parking Lot Movements	38.5	31.1	41.7	11.7
Outdoor Activity	40.7	32.7	45.7	13.0
Trash Enclosure Activity	25.6	18.1	28.8	7.1
Total (All Noise Sources)	**44.9**	**36.4**	**48.4**	**18.9**

[1] See Exhibit 10-A for the noise source locations. CadnaA noise model calculations are included in Appendix 10.2.

Table 10-3 shows the Project operational noise levels during the nighttime hours of 10:00 p.m. to 7:00 a.m. The nighttime hourly noise levels at the off-site receiver locations are expected to range from 15.6 to 43.3 dBA L_{eq}. Appendix 10.2 includes the detailed noise model inputs including the existing perimeter walls used to estimate the Project operational noise levels presented in this section.

TABLE 10-3: PROJECT NIGHTTIME OPERATIONAL NOISE LEVELS

Noise Source[1]	Operational Noise Levels by Receiver Location (dBA L_{max})			
	R1	R2	R3	R4
Air Conditioning Units	38.1	28.1	39.8	13.6
Parking Lot Movements	37.6	30.2	40.8	10.8
Outdoor Activity	0.0	0.0	0.0	0.0

[3] City of Los Alamitos Municipal Code, Section 17.20.050 (Appendix 3.1)
[4] Do the estimated Project operational noise source activities exceed the noise level standards?
"Daytime" = 7:00 a.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

10.6 PROJECT OPERATIONAL NOISE LEVEL INCREASES

To describe the Project operational noise level increases, the Project operational noise levels are combined with the existing ambient noise levels measurements for the nearest receiver locations potentially impacted by Project operational noise sources. Since the units used to measure noise, decibels (dB), are logarithmic units, the Project-operational and existing ambient noise levels cannot be combined using standard arithmetic equations. (9) Instead, they must be logarithmically added using the following base equation:

$$SPL_{Total} = 10\log_{10}[10^{SPL1/10} + 10^{SPL2/10} + \ldots 10^{SPLn/10}]$$

Where "SPL1," "SPL2," etc. are equal to the sound pressure levels being combined, or in this case, the Project-operational and existing ambient noise levels. The difference between the combined Project and ambient noise levels describes the Project noise level increases to the existing ambient noise environment. Noise levels that would be experienced at receiver locations when Project-source noise is added to the daytime and nighttime ambient conditions are presented on Tables 10-2 and 10-3, respectively.

As indicated on Tables 10-5 and 10-6, the Project will generate an unmitigated daytime and nighttime operational noise level increases ranging from less than 0.0 to 1.2 dBA L_{eq} at the nearest receiver locations. In effect, the amount to which a given noise level increase is considered acceptable is reduced based on existing ambient noise conditions. Based on the operational noise level increase significance criteria presented in Section 4.2, the Project-related operational noise level increases will satisfy the operational noise level increase criteria at the nearest sensitive receiver locations and the impact will be *less than significant.*

TABLE 10-5: DAYTIME PROJECT OPERATIONAL NOISE LEVEL INCREASES

11 CONSTRUCTION IMPACTS

This section analyzes potential impacts resulting from the short-term construction activities associated with the development of the Project. Exhibit 11-A shows the construction noise source locations in relation to the nearest sensitive receiver locations previously described in Section 9. Section 17.20.020 of the City of Los Alamitos Code, construction activities are exempted from the noise ordinance if it occurs between the hours of 7:00 a.m. to 8:00 p.m. on weekdays and on Saturdays. No construction is allowed at any time on Sundays or Federal holidays.

In addition, since the City of Los Alamitos has not established a numeric maximum acceptable construction source noise levels at potentially affected receivers for CEQA analysis purposes, a numerical construction threshold based on Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual is used for analysis of daytime construction impacts. The FTA considers a daytime exterior construction noise level of 80 dBA L_{eq} as a reasonable threshold for noise sensitive residential land use. (7 p. 179)

11.1 CONSTRUCTION NOISE LEVELS

Noise generated by the Project construction equipment will include a combination of trucks, power tools, concrete mixers, and portable generators that when combined can reach high levels. The number and mix of construction equipment is expected to occur in the following stages:

- Demolition
- Site Preparation
- Grading
- Building Construction
- Paving
- Architectural Coating

11.2 CONSTRUCTION REFERENCE NOISE LEVELS

To describe construction noise activities, this construction noise analysis was prepared using reference construction equipment noise levels from the Federal Highway Administration (FHWA) published the Roadway Construction Noise Model (RCNM), which includes a national database of construction equipment reference noise emission levels. (27) The RCNM equipment database, provides a comprehensive list of the noise generating characteristics for specific types of construction equipment. In addition, the database provides an acoustical usage factor to estimate the fraction of time each piece of construction equipment is operating at full power (i.e., its loudest condition) during a construction operation.

EXHIBIT 11-A: CONSTRUCTION ACTIVITY AND RECEIVER LOCATIONS

TABLE 11-1: CONSTRUCTION REFERENCE NOISE LEVELS

Construction Stage	Reference Construction Equipmnet[1]	Reference Noise Level @ 50 Feet (dBA L_{eq})	Composite Reference Noise Level (dBA L_{eq})	Reference Power Level (dBA L_w)
Demolition	Front End Loader	75.0	84.5	116.1
	Gradall	83.0		
	Excavator	77.0		
Site Preparation	Dozer	78.0	83.4	115.1
	Front End Loader	75.0		
	Grader	81.0

Architectural Coating	Man Lift	68.0	76.2	107.8
	Compressor (air)	74.0		
	Generator (<25kVA)	70.0		

[1] FHWA Road Construction Noise Model.

11.3 CONSTRUCTION NOISE ANALYSIS

Using the reference construction equipment noise levels and the CadnaA noise prediction model, calculations of the Project construction noise level impacts at the nearby sensitive receiver locations were completed. To assess a reasonable worst-case construction scenario and account for the dynamic nature of construction activities, the Project construction noise analysis models the equipment combination with the highest reference level as a moving point within the construction area (Project site boundary). Construction impacts are based on the highest noise level calculated at each receiver location. As shown on Table 11-2, the construction noise levels are expected to range from 26.8 to 63.6 dBA L_{eq}, and the highest construction levels are expected to range from 35.1 to 63.6 dBA L_{eq} at the nearby receiver locations. Appendix 11.1 includes the detailed CadnaA construction noise model inputs.

The construction noise analysis presents a conservative approach with the highest noise-level-producing equipment for each stage of Project construction operating at the closest point from primary construction activity to the nearby sensitive receiver locations. This scenario is unlikely to occur during typical construction activities and likely overstates the construction noise levels which will be experienced at each receiver location.

TABLE 11-2: CONSTRUCTION EQUIPMENT NOISE LEVEL SUMMARY

Receiver Location[1]	Construction Noise Levels (dBA L_{eq})						
	Demolition	Site Preparation	Grading	Building Construction	Paving	Architectural Coating	Highest Levels[2]
R1	59.1	58.0	58.6	52.0	52.5	50.8	58.6
R2	54.8	53.7	54.3	47.7	48.2	46.5	54.3
R3	63.6	62.5	63.1	56.5	57.0	55.3	63.1
R4	35.1	34.0	34.6	28.0	28.5	26.8	34.6

[1] The nearest construction noise source and receiver locations are shown on Exhibit 11-A. All receivers are shown on Exhibit 9A
[2] Construction noise level calculations based on distance from the project site boundaries (construction activity area) to nearby receiver locations. CadnaA construction noise model inputs are included in Appendix 11.1.

11.4 CONSTRUCTION NOISE LEVEL COMPLIANCE

To evaluate whether the Project will generate potentially significant short-term noise levels at nearest receiver locations, a construction-related daytime noise level threshold of 80 dBA L_{eq} is used as a reasonable threshold to assess the daytime construction noise level impacts. The construction noise analysis shows that the nearest receiver locations will satisfy the reasonable daytime 80 dBA L_{eq} significance threshold during Project construction activities as shown on Table 11-3. Therefore, the noise impacts due to Project construction noise are considered *less than significant* at all receiver locations.

TABLE 11-3: CONSTRUCTION NOISE LEVEL COMPLIANCE

Receiver Location[1]	Construction Noise Levels (dBA L_{eq})		
	Highest Construction Noise Levels[2]	Threshold[3]	Threshold Exceeded?[4]
R1	58.8	80	No
R2	54.4	80	No
R3	63.2	80	No
R4	35.6	80	No

[3] Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual.
[4] Do the estimated Project construction noise levels exceed the construction noise level threshold?

11.5 CONSTRUCTION VIBRATION IMPACTS

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from Project construction activities would cause only intermittent, localized intrusion. Ground-borne vibration levels resulting from typical construction activities occurring within the Project site were estimated by data published by the Federal Transit Administration (FTA). (7) However, while vehicular traffic is rarely perceptible, construction has

the potential to result in varying degrees of temporary ground vibration, depending on the specific construction activities and equipment used. Ground vibration levels associated with various types of construction equipment are summarized on Table 11-4. Based on the representative vibration levels presented for various construction equipment types, it is possible to estimate the potential Project construction vibration levels using the following vibration assessment methods defined by the FTA. To describe the human response (annoyance) associated with vibration impacts the FTA provides the following equation: $PPV_{equip} = PPV_{ref} \times (25/D)^{1.5}$

TABLE 11-4: VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

Equipment	PPV (in/sec) at 25 feet
Small bulldozer	0.003
Jackhammer	0.035
Loaded Trucks	0.076
Large bulldozer	0.089

Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual

Using the vibration source level of construction equipment provided on Table 11-4 and the construction vibration assessment methodology published by the FTA, it is possible to estimate the Project vibration impacts. Table 11-5 presents the expected Project related vibration levels at the nearby receiver locations. At distances ranging from 51 to 5,046 feet from the Project construction activities, construction vibration velocity levels are estimated to range from less than 0.01 to 0.03 in/sec PPV. Based on maximum acceptable continuous vibration threshold of 0.30 PPV (in/sec), the typical Project construction vibration levels will satisfy the building damage thresholds at all receiver locations. Therefore, the Project-related vibration impacts are considered less than significant during the construction activities at the Project site.

In addition, the typical construction vibration levels at the nearest sensitive receiver locations are unlikely to be sustained during the entire construction period but will occur rather only during the times that heavy construction equipment is operating adjacent to the Project site boundaries.

TABLE 11-5: PROJECT CONSTRUCTION VIBRATION LEVELS

Receiver Location[1]	Distance to Const. Activity (Feet)[2]	Typical Construction Vibration Levels PPV (in/sec)[3]					Thresholds PPV (in/sec)[4]	Thresholds Exceeded?[5]
		Small bulldozer	Jack-hammer	Loaded Trucks	Large Bulldozer	Highest Vibration Level		
R1	173'	0.00	0.00	0.00	0.00	0.00	0.30	No
R2	91'	0.00	0.01	0.01	0.01	0.01	0.30	No
R3	51'	0.00	0.01	0.03	0.03	0.03	0.30	No

"PPV" = Peak Particle Velocity

12 ON-SITE AIRCRAFT NOISE IMPACTS

An on-site exterior aircraft noise impact analysis has been completed to determine the noise exposure levels that would result from adjacent JFTB Los Alamitos aircraft noise sources in the Project study area, and to identify potential noise abatement measures for the proposed Project that would achieve acceptable Project noise levels.

The JFTB Los Alamitos is located adjacent to, and northwest of the Project. Exhibit 3-B shows the Project site in relation to the airport's projected noise level contour boundaries, as provided by the *2020 Noise Assessment for Los Alamitos Airfield, Joint Forces Training Base Los Alamitos* (18). As shown on Exhibit 12-A, the northwestern portion of the Project site would locate residential uses between the 60 and 65 dBA CNEL noise level contours of JFTB Los Alamitos. The compatibility criteria (16), shown on Exhibit 3-D, indicates residential land uses exposed to noise levels less than 60 dBA CNEL are "normally consistent", less than 65 dBA CNEL are considered "conditionally consistent" which requires an acoustical analysis to ensure that the interior CNEL does not exceed 45 dBA CNEL. The ALEUP does not require any additional considerations for exterior locations exposed to noise levels below 70 dBA CNEL.

As discussed in Section 7.2.1, typical building construction will provide a Noise Reduction (NR) of approximately 12 dBA with "windows open" and a minimum 25 dBA noise reduction with "windows closed." Based on future JFTB Los Alamitos aircraft noise levels ranging from 60 to 65 dBA CNEL, interior noise levels would range from 35 dBA to 40 dBA CNEL. This noise level analysis shows that the 45 dBA CNEL interior noise standard can be satisfied using standard construction and complying with statutory and regulatory noise requirements for all residential units exposed to aircraft noise from JFTB Los Alamitos. Therefore, the Project would not expose people residing or working in the project area to excessive noise levels from airport or aircraft operations, and impacts would be *less than significant*.

APPENDIX 3.1:

CITY OF LOS ALAMITOS MUNICIPAL CODE

This page intentionally left blank

Los Alamitos, California Municipal Code

Title 17 ZONING

Division 3: SITE PLANNING AND GENERAL DEVELOPMENT STANDARDS

Chapter 17.20 NOISE

17.20.010 Purpose

17.20.020 Exemptions

17.20.030 Noise Level Measurement Criteria

17.20.040 Designated Noise Districts

17.20.050 Exterior Noise Standards

17.20.060 Interior Noise Standards

17.20.070 Special Provisions—Schools, Hospitals, and Places of Public Assembly

17.20.080 Manner of Enforcement

17.20.090 Relief from Standards—Application Procedure

17.20.010 Purpose

A. The City establishes the noise regulations in this chapter to control unnecessary, excessive, and annoying sounds emanating from all properties and land uses in the City. It is the declared policy of the City to prohibit these sounds generated from all sources, as specified in this chapter.

B. The City recognizes and declares, based on published scientific and health data, that certain noise levels are detrimental to the public health, welfare, and general safety and contrary to public interest. Therefore, the Council does ordain and declare that creating, maintaining, causing, or allowing to create, maintain, or cause any noise in a manner prohibited by, or not in conformity with the provisions of this chapter, is a public nuisance and shall be abated and when such abated is not achieved, to be punishable as a public nuisance pursuant to Section 17.20.080 (Manner of Enforcement) of this title. (Ord. 19-03 § 3, 2019; Ord. 688 § 1, 2006)

17.20.020 Exemptions

The following activities shall be exempt from the provisions of this chapter.

A. School bands, school athletic events, and school entertainment events, provided these events are conducted on school property or authorized by special permit from the City;

B. Activities lawfully conducted in public parks, public playgrounds, and public or private school grounds;

C. A mechanical device, apparatus, or equipment used, related to, or connected with emergency machinery, vehicle, or work;

D. Noise sources associated with construction, repair, remodeling, or grading of any real property, provided a permit has been obtained from the City, and further provided the activities do not take place between the hours of 8:00 p.m. and 7:00 a.m. on weekdays and on Saturdays, or at any time on Sundays or Federal holidays;

E. Noise sources associated with the maintenance of real property, provided the activities take place between the hours of 8:00 a.m. and 8:00 p.m. on weekdays and on Saturdays, or between the hours of 9:00 a.m. and 6:00 p.m. on Sunday or a Federal holiday;

F. An activity or equipment to the extent that design regulation of it has been preempted by State or Federal laws. (Ord. 19-03 § 3, 2019; Ord. 688 § 1, 2006)

17.20.030 Noise Level Measurement Criteria

Noise level measurements made in compliance with the provisions of this chapter shall be performed using a sound level meter as defined in Division 7 (Definitions). The location selected for measuring exterior noise levels shall be at any point on the property line of the offender or anywhere on the affected property. Interior noise measurements shall be made within the affected building. The measurement shall be made at a point in the affected building at least four feet from the wall, ceiling, or floor nearest the noise source. (Ord. 19-03 § 3, 2019; Ord. 688 § 1, 2006)

17.20.040 Designated Noise Districts

A. **Noise Districts.** For the purposes of controlling noise and its impacts, the City shall be divided into noise districts defined as follows:

1. Noise District 1: All properties zoned R-1, R-2, R-3, and MH.

2. Noise District 2: All properties zoned C-O, C-F, and O-A, and with an MOZ overlay.

3. Noise District 3: All properties zoned C-G and TCMU, and with the ROZ overlay.

4. Noise District 4: All properties zoned P-L-I.

B. **Unclassified.** For any property or group of properties zoned SP, the Director shall assign an applicable noise district based upon the prevailing land uses within the specific plan area. (Ord. 19-03 § 3, 2019; Ord. 688 § 1, 2006)

17.20.050 Exterior Noise Standards

A. **Baseline.** The following noise standards, unless otherwise specifically indicated, shall apply to properties within the identified noise districts. No person shall cause any noise to occur that exceeds these standards except as authorized in subsection B, below.

Table 3-01: Exterior Noise Standards

Noise District	Maximum Noise Level	Time Period
1—Daytime	55 dB(A)	7:00 a.m. to 10:00 p.m.
1—Nighttime	50 dB(A)	10:00 p.m. to 7:00 a.m.
2	55 dB(A)	Anytime
3	60 dB(A)	Anytime
4	70 dB(A)	Anytime

B. **Temporary Exceedances.** It is unlawful for any person to create noise, or to allow the creation of noise, on property owned, leased, occupied, or otherwise controlled by a person, that causes the baseline noise levels established in subsection A, either within or outside of the City, to exceed the applicable noise standard as follows:

1. For a cumulative period of more than 30 minutes in any hour;
2. Plus five dB(A) for a cumulative period of more than 15 minutes in any hour;
3. Plus 10 dB(A) for a cumulative period of more than five minutes in any hour;
4. Plus 15 dB(A) for a cumulative period of more than one minute in any hour; or
5. Plus 20 dB(A) for any period of time.

C. **Maximum Allowable Noise Levels.** In the event the ambient noise level exceeds the noise limit categories described in subsections (B)(1) through (5) of this section above, the cumulative period applicable to the category shall be increased to reflect the ambient noise level. In the event the ambient noise level exceeds the fifth noise limit category, the maximum allowable noise level under that category shall be increased to reflect the maximum ambient noise level. (Ord. 19-03 § 3, 2019; Ord. 688 § 1, 2006)

17.20.060 Interior Noise Standards

A. **Baseline.** Interior noise standards established by the State Health and Safety Code (California Code of Regulations, Title 24, Part 2) shall apply to all multi-family residential construction and uses. For all other uses, the following interior noise standards shall apply.

Table 3-02: Interior Noise Standards

Noise District	Maximum Noise Level	Time Period
1—Daytime	55 dB(A)	7:00 a.m. to 10:00 p.m.
1—Nighttime	45 dB(A)	10:00 p.m. to 7:00 a.m.
2, 3, 4	55 dB(A)	Anytime

B. **Temporary Exceedances.** It is unlawful for any person to create noise, or to allow the creation of noise, on property owned, leased, occupied, or otherwise controlled by a person, that causes the noise level, when measured within structures in the applicable noise district, to exceed:

1. The noise standard for a cumulative period of more than five minutes in an hour;

2. The noise standard plus five dB(A) for a cumulative period of more than one minute in an hour; or

3. The noise standard plus ten 10 dB(A) for any period of time.

C. **Maximum Allowable Noise Levels.** In the event the ambient noise level exceeds either of the first two noise limit categories described in subsections (B)(1) and (2) of this section, the cumulative period applicable to the category shall be increased to reflect the ambient noise level. In the event the ambient noise level exceeds the third noise limit category, the maximum allowable noise level under that category shall be increased to reflect the maximum ambient noise level.

D. **Different Noise Districts.** In the event that the noise source and the affected property are within different noise districts, the noise standards of the affected property shall apply. (Ord. 19-03 § 3, 2019; Ord. 688 § 1, 2006)

17.20.070 Special Provisions—Schools, Hospitals, and Places of Public Assembly

It is unlawful for a person to create noise that causes the noise level at a school, hospital, or place of public assembly—while the facility is in use—to exceed the noise limits specified for exterior noise in this chapter, or which noise level unreasonably interferes with the use of the facility or which unreasonably disturbs or annoys patients in a hospital, provided conspicuous signs are displayed in three separate locations within one-tenth of a mile of the school, hospital, or place of public assembly indicating the presence of such school, hospital, or place of public assembly. (Ord. 19-03 § 3, 2019; Ord. 688 § 1, 2006)

17.20.080 Manner of Enforcement

A. The Director and duly authorized representatives are directed to enforce the provisions of this chapter. The Police Chief and duly authorized representatives are authorized in compliance with Penal Code Section 836.5 to arrest any person without a warrant when they have reasonable cause to believe that a person has committed a misdemeanor in their presence.

B. Persons shall not interfere with, oppose, or resist an authorized person charged with enforcement of this chapter while any person is engaged in the performance of his or her duty. (Ord. 19-03 § 3, 2019; Ord. 688 § 1, 2006)

17.20.090 Relief from Standards—Application Procedure

A. **Application Requirements.** The owner or operator of a noise source that violates any of the provisions of this chapter may file an application with the Director for relief from the provisions, and the owner or operator shall detail all actions taken to comply with the provisions, the reasons why immediate compliance cannot be achieved, a proposed method of achieving compliance, and a proposed time schedule for its accomplishment. The application shall be accompanied by a fee as established by resolution of the Council.

B. **Separate Applications.** A separate application shall be filed for each noise source. However, in the circumstance that several mobile sources are under common ownership, or several fixed sources occur on a single property, such request for relief may be combined into one application. Upon receipt of the application and fee, the Director shall refer it with his/her recommendation in compliance with the provisions of this chapter.

C. **Compliance Required Until Relief Granted.** An applicant for relief shall remain subject to prosecution under the terms of this title until such relief is granted.

D. **Review Authority.** The Planning Commission shall evaluate all applications for relief from the requirements of this chapter and may grant relief with respect to time for compliance subject to the terms, conditions, and requirements as it may deem reasonable to achieve maximum compliance with the provisions of this chapter. These terms, conditions, and requirements may include, but shall not be limited to, limitations on noise levels and operating hours. Each relief application granted shall identify in detail the approved method of achieving maximum compliance and a time schedule for its accomplishment.

E. **Factors to Be Considered.** In its determinations, the Planning Commission shall consider the magnitude of nuisance caused by the offensive noise; the uses of property within the area of impingement by the noise; the time factors related to study, design, financing and construction of remedial work; the economic factors related to age and useful life of equipment; and the general public interest and welfare.

F. **Violations.** Any relief granted shall be by resolution and shall be transmitted to the Director for enforcement. A violation of the terms of the relief is unlawful. (Ord. 19-03 § 3, 2019; Ord. 688 § 1, 2006)

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL (CALVENO) - v10/31/19

Scenario: Backyard No Wall
Road Name: Lampson Avenue
Lot No: Apartments

Project Name: 4665 Lampson Avenue
Job Number: 14501
Analyst: B. Maddux

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	15,150	vehicles
Peak Hour Percentage:	10%	
Peak Hour Volume:	1,515	vehicles
Vehicle Speed:	45	mph
Near/Far Lane Distance:	46	feet

Site Data

Barrier Height:	**0.0**	**feet**
Barrier Type (0-Wall, 1-Berm):	0.0	
Centerline Dist. to Barrier:	52.0	feet
Centerline Dist. to Observer:	57.0	feet
Barrier Distance to Observer:	5.0	feet
Observer Height (Above Pad):	5.0	feet
Pad Elevation:	0.0	feet
Road Elevation:	0.0	feet
Barrier Elevation:	0.0	feet
Road Grade:	1.0%	

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	*Day*	*Evening*	*Night*	*Daily*
Autos:	77.5%	12.9%	9.6%	97.42%

CARRIER 25HBC5 AIR CONDITIONING UNIT

This page intentionally left blank

24ABC6
Comfort™ 16 Air Conditioner with Puron® Refrigerant 1–1/2 to 5 Nominal Tons

Carrier
turn to the experts

Product Data

Puron™
the environmentally sound refrigerant

Comfort SERIES

Carrier's Air Conditioners with Puron® refrigerant provide a collection of features unmatched by any other family of equipment. The 24ABC has been designed utilizing Carrier's Puron refrigerant. The environmentally sound refrigerant allows you to make a responsible decision in the protection of the earth's ozone layer.

This product has been designed and manufactured to meet Energy Star® criteria for energy efficiency when matched with appropriate coil components. Refer to the combination ratings in the Product Data for system combinations that meet Energy Star® guidelines.

NOTE: Ratings contained in this document are subject to change at any time. Always refer to the AHRI directory (www.ahridirectory.org) for the most up-to-date ratings information.

INDUSTRY LEADING FEATURES / BENEFITS

Efficiency

- 14 - 16.5 SEER/11.0- 13.5 EER
- Microtube Technology™ refrigeration system
- Indoor air quality accessories available

Sound

- Sound level as low as 76 dBA
- Sound level as low as 74 dBA with accessory sound blanket

Comfort

- System supports Edge® Thermidistat™ or standard thermostat controls

Reliability

- Puron® refrigerant - environmentally sound, won't deplete the ozone layer and low lifetime servce cost.
- Scroll compressor
- Internal pressure relief valve
- Internal thermal overload
- Filter drier
- Balanced refrigeration system for maximum reliability

Durability

WeatherArmor™ protection package:

- Solid, durable sheet metal construction
- Dense wire coil guard standard
- Baked-on, complete outer coverage, powder paint

Applications

- Long-line - up to 250 feet (76.20 m) total equivalent length, up to 200 feet (60.96 m) condenser above evaporator, or up to 80 ft. (24.38 m) evaporator above condenser (See Longline Guide for more information.)
- Low ambient (down to -20°F/-28.9°C)) with accessory kit

ENERGY STAR

This product has been designed and manufactured to meet Energy Star® criteria for energy efficiency when matched with appropriate coil components. However, proper refrigerant charge and proper air flow are critical to achieve rated capacity and efficiency. Installation of this product should follow all manufacturing refrigerant charging and air flow instructions. **Failure to confirm proper charge and air flow may reduce energy efficiency and shorten equipment life.**

Note: See unit Installation Instruction for proper installation.

† See *Liquid Line Sizing For Cooling Only Systems with Puron Refrigerant* tables.

REFRIGERANT PIPING LENGTH LIMITATIONS

Liquid Line Sizing and Maximum Total Equivalent Lengths† for Cooling Only Systems with Puron® Refrigerant:

The maximum allowable length of a residential split system depends on the liquid line diameter and vertical separation between indoor and outdoor units.

See Table below for liquid line sizing and maximum lengths :

Maximum Total Equivalent Length
Outdoor Unit BELOW Indoor Unit

Size	Liquid Line Connection	Liquid Line Diam. w/ TXV	AC with Puron Refrigerant Maximum Total Equivalent Length†: Outdoor unit BELOW Indoor Vertical Separation ft (m)

REFRIGERANT CHARGE ADJUSTMENTS

Liquid Line Size	Puron Charge oz/ft
3/8	0.60 (Factory charge for lineset = 9 oz)
5/16	0.40
1/4	0.27

Units are factory charged for 15 ft (4.6 m) of 3/8" liquid line. The factory charge for 3/8" lineset 9 oz. When using other length or diameter liquid lines, charge adjustments are required per the chart above.

Charging Formula:

[(Lineset oz/ft x total length) – (factory charge for lineset)] = charge adjustment

Example 1: System has 15 ft of line set using existing 1/4" liquid line. What charge adjustment is required?

Formula: (.27 oz/ft x 15ft) – (9 oz) = (-4.95) oz.

Net result is to remove 4.95 oz of refrigerant from the system

Example 2: System has 45 ft of existing 5/16" liquid line. What is the charge adjustment?

Formula: (.40 oz/ft. x 45ft) – (9 oz.) = 9 oz.

Net result is to add 9 oz of refrigerant to the system

LONG LINE APPLICATIONS

An application is considered Long Line, when the refrigerant level in the system requires the use of accessories to maintain acceptable refrigerant management for systems reliability. See Accessory Usage Guideline table for required accessories. Defining a system as long line depends on the liquid line diameter, actual length of the tubing, and vertical separation between the indoor and outdoor units.

For Air Conditioner systems, the chart below shows when an application is considered Long Line.

AC WITH PURON® REFRIGERANT LONG LINE DESCRIPTION ft (m)
Beyond these lengths, long line accessories are required

Liquid Line Size	Units On Same Level	Outdoor Below Indoor	Outdoor Above Indoor
1/4	No accessories needed within allowed lengths	No accessories needed within allowed lengths	175 (53.3)
5/16	120 (36.6)	50 (15.2)	120 (36.6)
3/8	80 (24.4)	35 (10.7)	80 (24.4)

Note: See Long Line Guideline for details

VAPOR LINE SIZING AND COOLING CAPACITY LOSS

Acceptable vapor line diameters provide adequate oil return to the compressor while avoiding excessive capacity loss. The suction line diameters shown in the chart below are acceptable for AC systems with Puron refrigerant:

Unit Nominal Size (Btuh)	Maximum Liquid Line Diameters (In. OD)	Vapor Line Diameters (In. OD)	Cooling Capacity Loss (%) Total Equivalent Line Length ft. (m)								
			26–50 (7.9–15.2)	51–80 (15.5–24.4)	81–100 (24.7–30.5)	101–125 (30.8–38.1)	126–150 (38.4–45.7)	151–175 (46.0–53.3)	176–200 (53.6–61.0)	201–225 (61.3–68.6)	226–250 (68.9–76.2)
18000 1 Stage AC with Puron	3/8	1/2	1	2	3	5	6	7	8	9	11

ACCESSORY USAGE GUIDELINE

ACCESSORY	REQUIRED FOR LOW–AMBIENT COOLING APPLICATIONS (Below 55°F/12.8°C)	REQUIRED FOR LONG LINE APPLICATIONS* (Over 80 ft./24.38 m)	REQUIRED FOR SEA COAST APPLICATIONS (Within 2 miles/3.22 km)
Ball Bearing Fan Motor	Yes†	No	No
Compressor Start Assist Capacitor and Relay	Yes	Yes	No
Crankcase Heater	Yes	Yes	No
Evaporator Freeze Thermostat	Yes	No	No
Hard Shut–Off TXV	Yes	Yes	Yes
Liquid Line Solenoid Valve	No	No	No
Motor Master® Control or Low–ambient Pressure Switch	Yes	No	No
Support Feet	Recommended	No	Recommended
Winter Start Control	Yes	No	No

* For tubing line sets between 80 and 200 ft. (24.38 and 60.96 m) and/or 20 ft. (6.09 m) vertical differential, refer to Residential Split–System Longline Application Guideline.

† Required for Low–Ambient Controller (full modulation feature) MotorMaster® Control.

Accessory Description and Usage (Listed Alphabetically)

1. Ball-Bearing Fan Motor

A fan motor with ball bearings which permits speed reduction while maintaining bearing lubrication.

Usage Guideline:

Required on all units when MotorMaster® is used.

2. Compressor Start Assist - Capacitor and Relay

Start capacitor and relay gives a ”hard” boost to compressor motor at each start up.

Usage Guideline:

Required for reciprocating compressors in the following applications:

Long line

Low ambient cooling

Hard shut off expansion valve on indoor coil

Liquid line solenoid on indoor coil

Required for single-phase scroll compressors in the following applications:

Long line

Low ambient cooling

Suggested for all compressors in areas with a history of low voltage problems.

3. Compressor Start Assist — PTC Type

Solid state electrical device which gives a ”soft” boost to the compressor at each start-up.

Usage Guideline:

Suggested in installations with marginal power supply.

4. Crankcase Heater

An electric resistance heater which mounts to the base of the compressor to keep the lubricant warm during off cycles. Improves compressor lubrication on restart and minimizes the chance of liquid slugging.

Usage Guideline:

Required in low ambient cooling applications.

Required in long line applications.

Suggested in all commercial applications.

5. Cycle Protector

The cycle protector is designed to prevent compressor short cycling. This control provides an approximate 5-minute delay after power to the compressor has been interrupted for any reason, including power outage, protector control trip, thermostat jiggling, or normal cycling.

6. Evaporator Freeze Thermostat

An SPST temperature-actuated switch that stops unit operation when evaporator reaches freeze-up conditions.

Usage Guideline:

Required when low ambient kit has been added.

7. Low-Ambient Pressure Switch Kit

A long life pressure switch which is mounted to outdoor unit service valve. It is designed to cycle the outdoor fan motor in order to maintain head pressure within normal operating limits (approximately 100 psig to 225 psig). The control will maintain working head pressure at low-ambient temperatures down to 0°F (-18°C) when properly installed.

Usage Guideline:

A Low-Ambient Pressure Switch or MotorMaster® Low-Ambient Controller must be used when cooling operation is used at outdoor temperatures below 55°F (12.8°C).

8. MotorMaster® Low-Ambient Controller

A fan-speed control device activated by a temperature sensor, designed to control condenser fan motor speed in response to the saturated, condensing temperature during operation in cooling mode only. For outdoor temperatures down to -20°F (-28.9°C), it maintains condensing temperature at 100°F ±10°F (37.8°C ± 5.5°C).

Usage Guideline:

A MotorMaster® Low Ambient Controller or Low-Ambient Pressure Switch must be used when cooling operation is used at outdoor temperatures below 55°F (12.8°C).

Suggested for all commercial applications.

9. Outdoor Air Temperature Sensor

Designed for use with Carrier Thermostats listed in this publication. This device enables the thermostat to display the outdoor temperature. This device also

is required to enable special thermostat features such as auxiliary heat lock out.

Usage Guideline:

Suggested for all Carrier thermostats listed in this publication.

Accessory Description and Usage (Listed Alphabetically) (Continued)

10. Sound Hood

Wraparound sound reducing cover for the compressor. Reduces the sound level by about 2 dBA.

Usage Guideline:

Suggested when unit is installed closer than 15 ft (4.57 m) to quiet areas, bedrooms, etc.

Suggested when unit is installed between two houses less than 10 ft (3.05 m) apart.

11. Support Feet

Four stick-on plastic feet that raise the unit 4 in. (101.6 mm) above the mounting pad. This allows sand, dirt, and other debris to be flushed from the unit base, minimizing corrosion.

Usage Guideline:

Suggested in the following applications:

Coastal installations.

Windy areas or where debris is normally circulating.

Rooftop installations.

For improved sound ratings.

12. Thermostatic Expansion Valve (TXV)

A modulating flow-control valve which meters refrigerant liquid flow rate into the evaporator in response to the superheat of the refrigerant gas leaving the evaporator.

Kit includes valve, adapter tubes, and external equalizer tube. Hard shut off types are available.

NOTE: When using a hard shut off TXV with single phase reciprocating compressors, a Compressor Start Assist Capacitor and Relay is required.

Usage Guideline:

Required to achieve AHRI ratings in certain equipment combinations. Refer to combination ratings.

Hard shut off TXV or LLS required in air conditioner long line applications.

Required for use on all zoning systems.

13. Time-Delay Relay

An SPST delay relay which briefly continues operation of indoor blower motor to provide additional cooling after the compressor cycles off.

NOTE: Most indoor unit controls include this feature. For those that do not, use the guideline below.

Usage Guideline:

For improved efficiency ratings for certain combinations of indoor and outdoor units. Refer to AHRI Unitary Directory.

14. Winter Start Control

This control is designed to alleviate nuisance opening of the low-pressure switch by bypassing it for the first 3 minutes of operation.

* Permissible limits of the voltage range at which the unit will operate satisfactorily

† If wire is applied at ambient greater than 30°C, consult table 310–16 of the NEC (NFPA 70). The ampacity of non–metallic–sheathed cable (NM), trade name ROMEX, shall be that of 60°C conditions, per the NEC (NFPA 70) Article 334–80. If other than uncoated (no–plated), 60 or 75°C insulation, copper wire (solid wire for 10 AWG or smaller, stranded wire for larger than 10 AWG) is used, consult applicable tables of the NEC (NFPA 70).

‡ Length shown is as measured one way along wire path between unit and service panel for voltage drop not to exceed 2%.

** Time–Delay fuse.

FLA – Full Load Amps

LRA – Locked Rotor Amps

MCA – Minimum Circuit Amps

RLA – Rated Load Amps

NOTE: Control circuit is 24–V on all units and requires external power source. Copper wire must be used from service disconnect to unit. All motors/compressors contain internal overload protection.

Complies with 2007 requirements of ASHRAE Standards 90.1

CLEARANCES

Clearances (various examples)

Note: Numbers in ( ) = mm

IMPORTANT: When installing multiple units in an alcove, roof well, or partially enclosed area, ensure there is adequate ventilation to prevent re-circulation of discharge air.

CONSTRUCTION NOISE LEVEL CALCULATIONS

This page intentionally left blank

14501 - 4665 Lampson Ave

CadnaA Noise Prediction Model: 14501-06_Construction.cna
Date: 02.04.24
Analyst: B. Maddux

Calculation Configuration

Configuration	
Parameter	**Value**
General	
Max. Error (dB)	**0.00**
Max. Search Radius (#(Unit,LEN))	**2000.01**
Min. Dist Src to Rcvr	**0.00**
Partition	
Raster Factor	**0.50**
Max. Length of Section (#(Unit,LEN))	**999.99**
Min. Length of Section (#(Unit,LEN))	**1.01**
Min. Length of Section (%)	**0.00**
Proj. Line Sources	**On**
Proj. Area Sources	**On**
Ref. Time	
Daytime Penalty (dB)	**0.00**
Recr. Time Penalty (dB)	**5.00**
Night-time Penalty (dB)	**10.00**
DTM	
Standard Height (m)	**0.00**
Model of Terrain	**Triangulation**
Reflection	
max. Order of Reflection	**2**
Search Radius Src	**100.00**
Search Radius Rcvr	**100.00**
Max. Distance Source - Rcvr	**1000.00 1000.00**
Min. Distance Rvcr - Reflector	**1.00 1.00**
Min. Distance Source - Reflector	**0.10**
Industrial (ISO 9613)	
Lateral Diffraction	**some Obj**
Obst. within Area Src do not shield	**On**
Screening	**Incl. Ground Att. over Barrier**
	Dz with limit (20/25)
Barrier Coefficients C1,2,3	**3.0 20.0 0.0**
Temperature (#(Unit,TEMP))	**10**
rel. Humidity (%)	**70**
Ground Absorption G	**0.50**
Wind Speed for Dir. (#(Unit,SPEED))	**3.0**
Roads (TNM)	
Railways (FTA/FRA)	
Aircraft (???)	
Strictly acc. to AzB

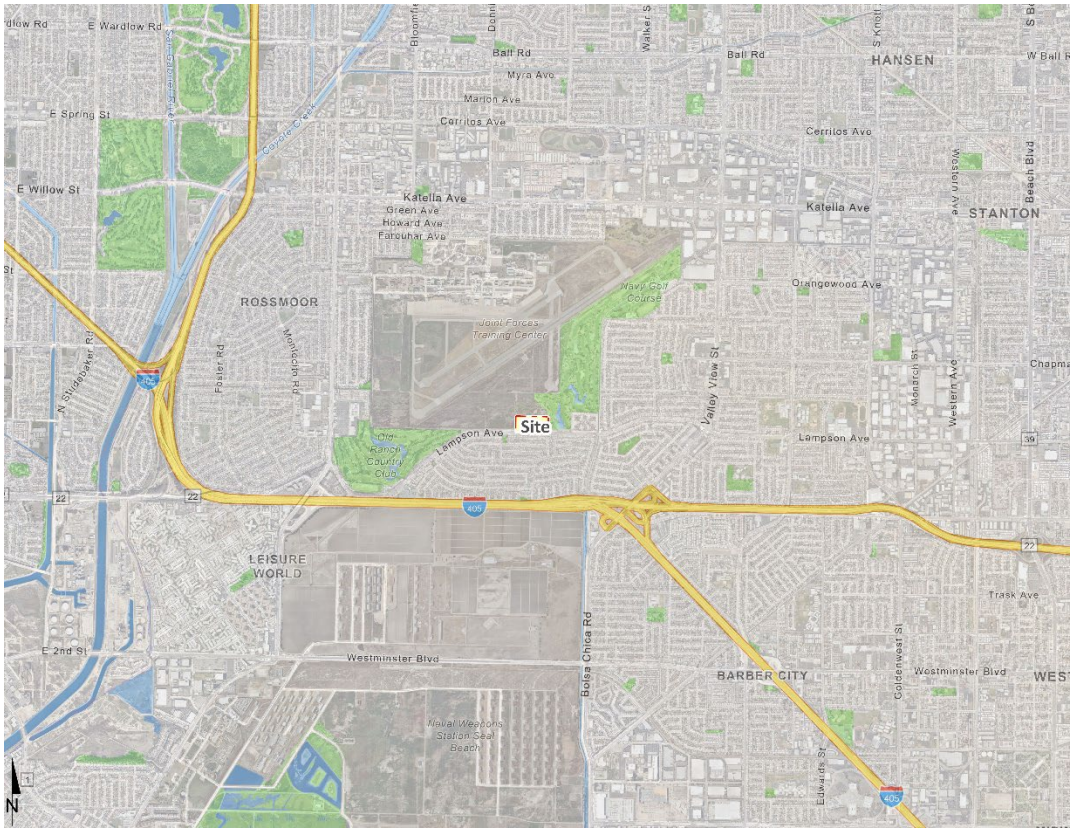
APPENDIX 1.1: APPROVED TRAFFIC STUDY SCOPING AGREEMENT

This Page Intentionally Left Blank

September 19, 2022



Mr. Tom Oliver
City of Los Alamitos
3191 Katella Avenue
Los Alamitos, CA 90720

4665 LAMPSON AVENUE TRAFFIC ANALYSIS SCOPING AGREEMENT

Mr. Tom Oliver,

The firm of Urban Crossroads, Inc. is pleased to submit this scoping letter regarding the traffic analysis for 4665 Lampson Avenue development (**Project**), which is located in the City of Los Alamitos (see Exhibit 1). This letter describes the proposed Project trip generation, trip distribution, and analysis methodology, which have been used to establish the draft proposed Project study area and analysis locations.

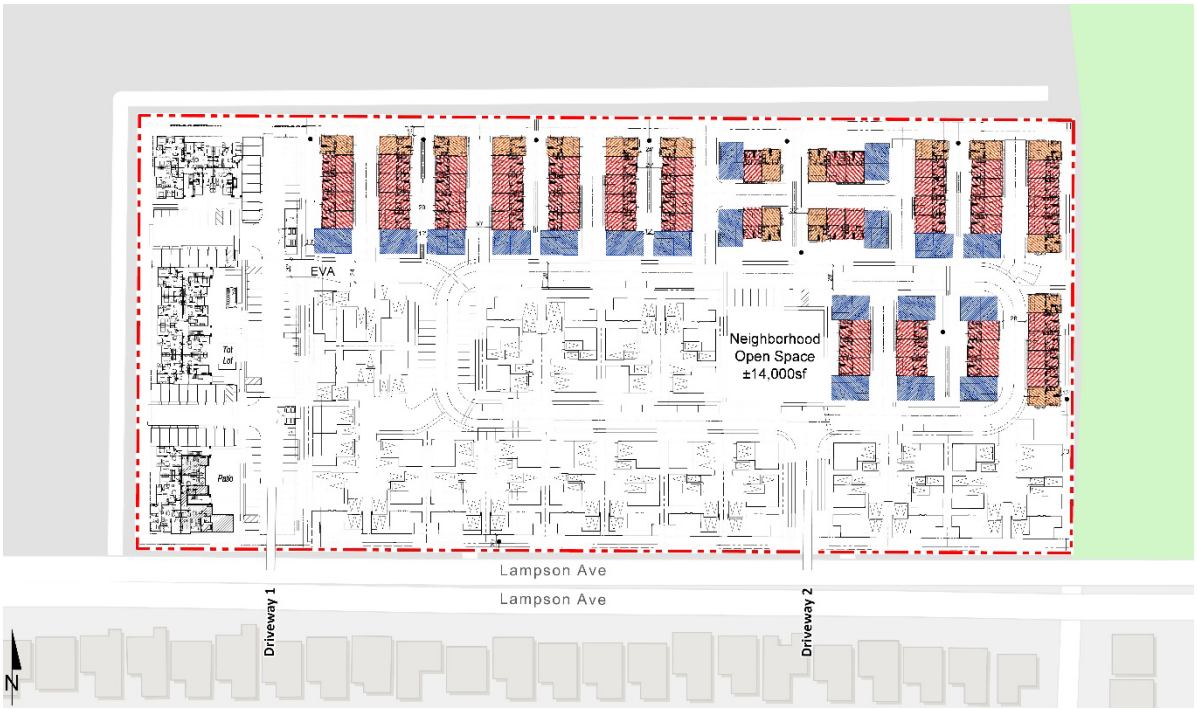


EXHIBIT 1: LOCATION MAP

PROJECT DESCRIPTION

The Project is anticipated to have an Opening Year of 2026. The Project consists of the development of 55 single family detached residential dwelling units (cluster homes), 114 multifamily (low-rise) residential dwelling units, and 77 affordable apartment dwelling units (total of 246 dwelling units). A preliminary site plan for the proposed Project is shown on Exhibit 2. Access to the Project site will be accommodated via Lampson Avenue. The site is currently occupied by the California Department of Fish and Wildlife building and parking lot, however, no credit will be taken for the existing use for the purposes of this analysis. Although the proposed Project is located in the City of Los Alamitos, however, access to the site is via intersections controlled by the City of Seal Beach.

EXHIBIT 2: PRELIMINARY SITE PLAN

TRIP GENERATION

Trip generation represents the amount of traffic that is attracted and produced by a development and is based upon the specific land uses planned for a given project. In order to develop the traffic characteristics of the proposed project, trip-generation statistics published in the Institute of Transportation Engineers (ITE) Trip Generation Manual (11th Edition, 2021) for the Single Family Detached Residential Land Use category (ITE Land Use Code 210), Multifamily (Low-Rise) Housing (ITE Land Use Code 220), and Affordable Housing (ITE Land Use Code 223) were used to calculate the trip generation.

TABLE 1: TRIP GENERATION RATES

Land Use[1]	Units[2]	ITE LU Code	AM Peak Hour In	AM Peak Hour Out	AM Peak Hour Total	PM Peak Hour In	PM Peak Hour Out	PM Peak Hour Total	Daily
Actual Vehicle Trip Generation Rates									
Single Family Detached	DU	210	0.18	0.52	0.70	0.59	0.35	0.94	9.43
Multifamily Housing (Low-Rise) (2-3 Floors)	DU	220	0.10	0.30	0.40	0.32	0.19	0.51	6.74
Affordable Housing	DU	223	0.10	0.26	0.36	0.27	0.19	0.46	4.81

[1] Trip Generation & Vehicle Mix Source: Institute of Transportation Engineers (ITE), Trip Generation Manual, Eleventh Edition (2021).

[2] DU = Dwelling Units

The trip generation summary illustrating daily, and peak hour trip generation estimates for the proposed Project are shown on Table 2. The proposed Project is anticipated to generate 1,658 two-way trip-ends per day with 112 AM peak hour trips and 147PM peak hour trips (see Table 2).

TABLE 2: PROJECT TRIP GENERATION SUMMARY

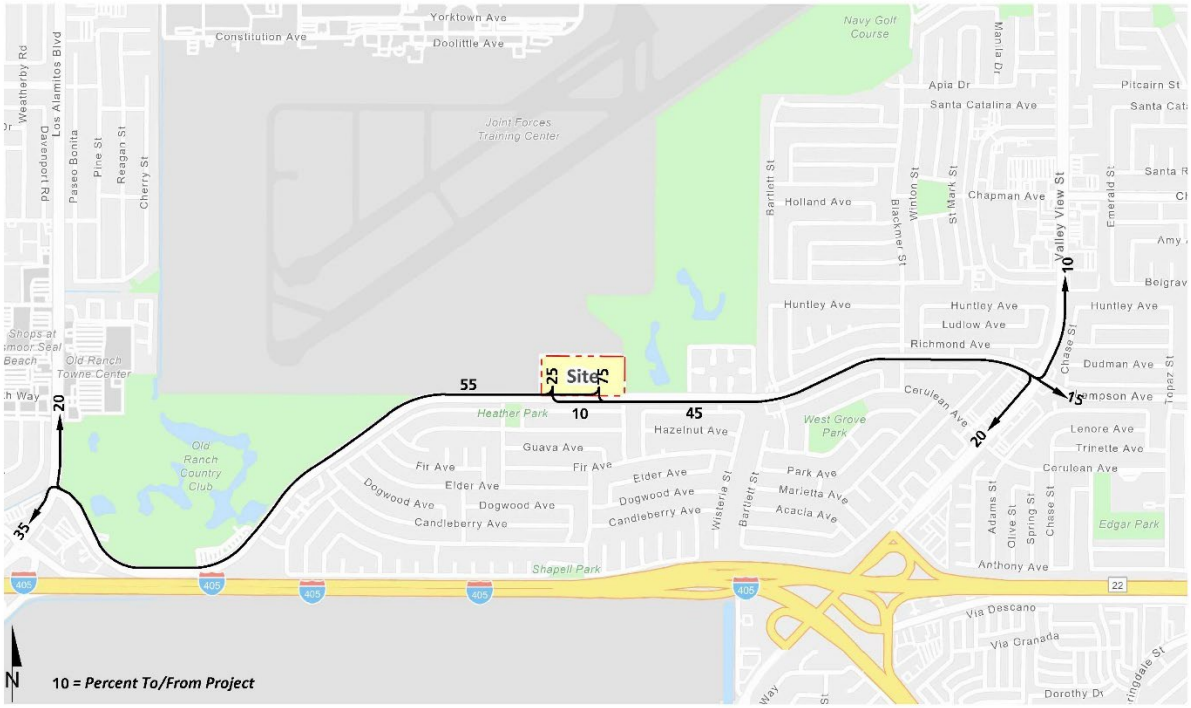
Land Use	Quantity	Units[1]	AM Peak Hour In	AM Peak Hour Out	AM Peak Hour Total	PM Peak Hour In	PM Peak Hour Out	PM Peak Hour Total	Daily
Actual Vehicles:									
Single Family Detached	55	DU	10	28	38	33	19	52	520
Mulifamily Housing	114	DU	11	35	46	37	22	59	768
Affordable Housing	77	DU	8	20	28	21	15	36	370
Project Total Trips			**29**	**83**	**112**	**91**	**56**	**147**	**1,658**

[1] DU = Dwelling Units

ANALYSIS SCENARIOS

Peak hour operations at each of the study area intersections and site access driveways will be assessed for the following analysis scenarios:

- Existing (2022) Conditions
- Opening Year Cumulative (2026) Without Project
- Opening Year Cumulative (2026) With Buildout
- General Plan Buildout (2042) Without Project
- General Plan Buildout (2042) With Project



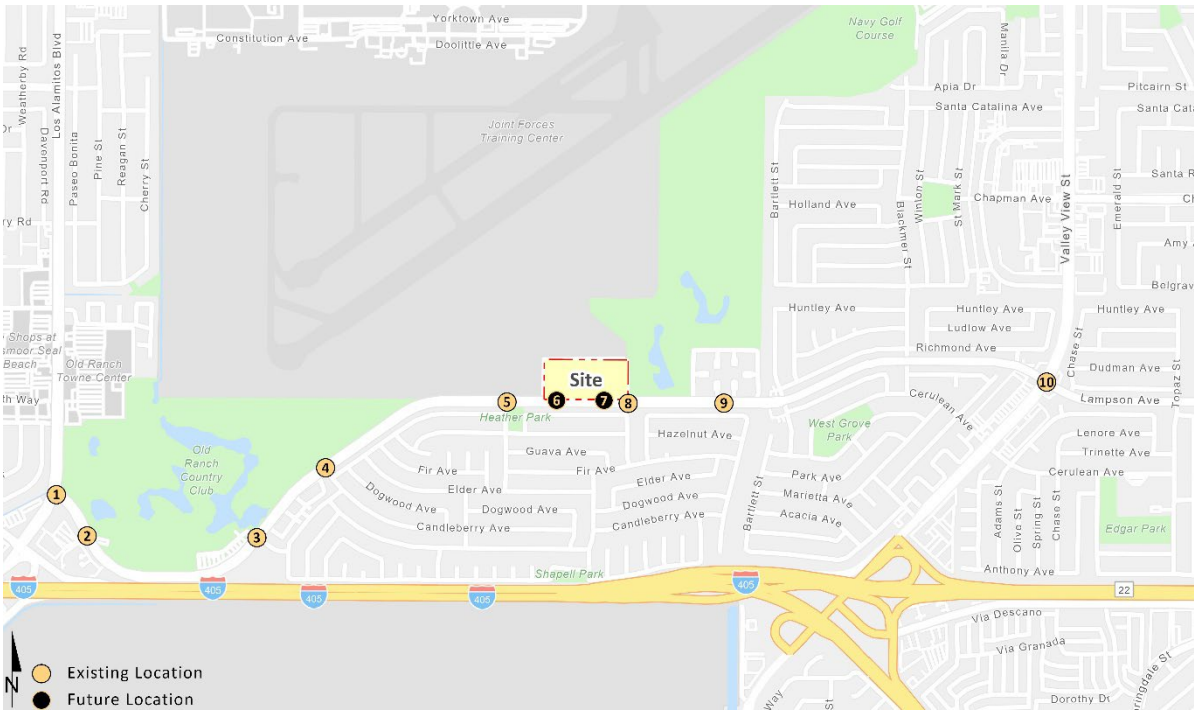
As most of the study area intersections lie within the City of Seal Beach, the City of Seal Beach Transportation Analysis Guidelines (dated June 2020) have been utilized for the purposes of the traffic study. Per the Guidelines, the signalized intersections will be evaluated using the Intersection Capacity Utilization (ICU) methodology while unsignalized intersections will be evaluated using the Highway Capacity Manual (HCM 6th Edition) methodology.

PROJECT TRIP DISTRIBUTIONS

Trip distribution is the process of identifying the probable destinations, directions or traffic routes that will be utilized by Project traffic. The potential interaction between the planned land uses

and surrounding regional access routes are considered, to identify the route where the Project traffic would distribute. The Project trip distribution and assignment process represents the directional orientation of traffic to and from the Project site. The trip distribution patterns are heavily influenced by the geographical location of the site, the location of surrounding land uses, and the proximity to the regional freeway system. The Project trip distribution patterns are graphically depicted on Exhibit 3.

EXHIBIT 3: PROJECT TRIP DISTRIBUTION



STUDY AREA

Per the City's guidelines, the proposed intersection analysis locations have been identified on Exhibit 4 and listed on Table 3.

TABLE 3: LIST OF STUDY INTERSECTIONS

#	Intersection	#	Intersection
1	Seal Beach Bl. & Lampson Av.	6	Rose St. & Lampson Av.
2	Old Ranch Plaza & Lampson Av.	7	Driveway 1 & Lampson Av.
3	Basswood St. & Lampson Av.	8	Driveway 2 & Lampson Av.
4	Candleberry Av. & Lampson Av.	9	Tulip St. & Lampson Av.
5	Heather St. & Lampson Av.	10	Valley View St. & Lampson Av.

EXHIBIT 4: STUDY AREA

LEVEL OF SERVICE (LOS) CRITERIA

The City of Los Alamitos and City of Seal Beach have established LOS D as the minimum level of service for all roadways/intersections within the City. Therefore, any intersection operating at LOS E or F will be considered deficient for the purposes of this analysis.

EXISTING COUNT DATA

Traffic counts (classified by vehicle type) were conducted in May 2022 during a typical weekday when local schools were in session and operating on a typical bell schedule. Time periods counted were from 7:00-9:00 AM and 4:00-6:00 PM and include pedestrian and bicycle counts at each analysis location. No adjustments are proposed to the new traffic counts for the baseline traffic condition as traffic counts were conducted while local schools were in session (before Summer Break).

AMBIENT GROWTH RATE

Consistent with other City of Los Alamitos traffic studies performed by Urban Crossroads, an ambient growth rate of 2 percent per year, compounded annually, will be used for this analysis (2% per year over 4 years or 8.24% for 2026).

DEFICIENCY CRITERIA

City of Seal Beach:

To determine whether the addition of project traffic at a study intersection result in a deficiency, the following thresholds of significance will be utilized to determine when an intersection requires improvements:

Existing ICU	Project Related Increase in ICU
0.00 - 0.69	0.06
0.70 - 0.79	0.04
0.80 - 0.89	0.02
0.90+	0.01

City of Garden Grove:

To determine whether the addition of project traffic at a study intersection result in a deficiency, the following thresholds of significance will be utilized:

- Any signalized study intersection operating at an acceptable LOS D or better without project in which the addition of project traffic causes the intersection to degrade to LOS E or F shall identify improvements to improve the operations to LOS D or better.
- Any signalized intersection that is operating at LOS E or F without project traffic where the project increases v/c by 0.010 or more shall identify improvements to offset the increase in delay.
- An operational improvement would be required if the study determines that either section a) or both sections b) and c) occur at unsignalized study intersections:

  a) The addition of project related traffic causes the intersection to degrade from an acceptable LOS D or better to LOS E or LOS F.

  AND

  b) The intersection meets the peak hour traffic signal warrant after the addition of project traffic.

CUMULATIVE DEVELOPMENT PROJECTS

It is requested the City provide a list of cumulative projects to be included. The adjacent Cities of Long Beach, Seal Beach, and Garden Grove will be contacted to obtain current lists in their respective agencies as well.

SPECIAL ISSUES

The following special issues will be addressed as part of the TA:

- Traffic signal warrant analyses will be conducted for all unsignalized study area intersections for all applicable analysis scenarios.
- Evaluate the peak hour queuing at the Project driveways located along Lampson Avenue.

- Vehicle Miles Traveled (VMT) will be evaluated under separate cover but concurrently to the Traffic Study.

If you have any questions or comments, I can be reached at cso@urbanxroads.com.

Respectfully submitted,

URBAN CROSSROADS, INC.

Charlene So, PE
Principal

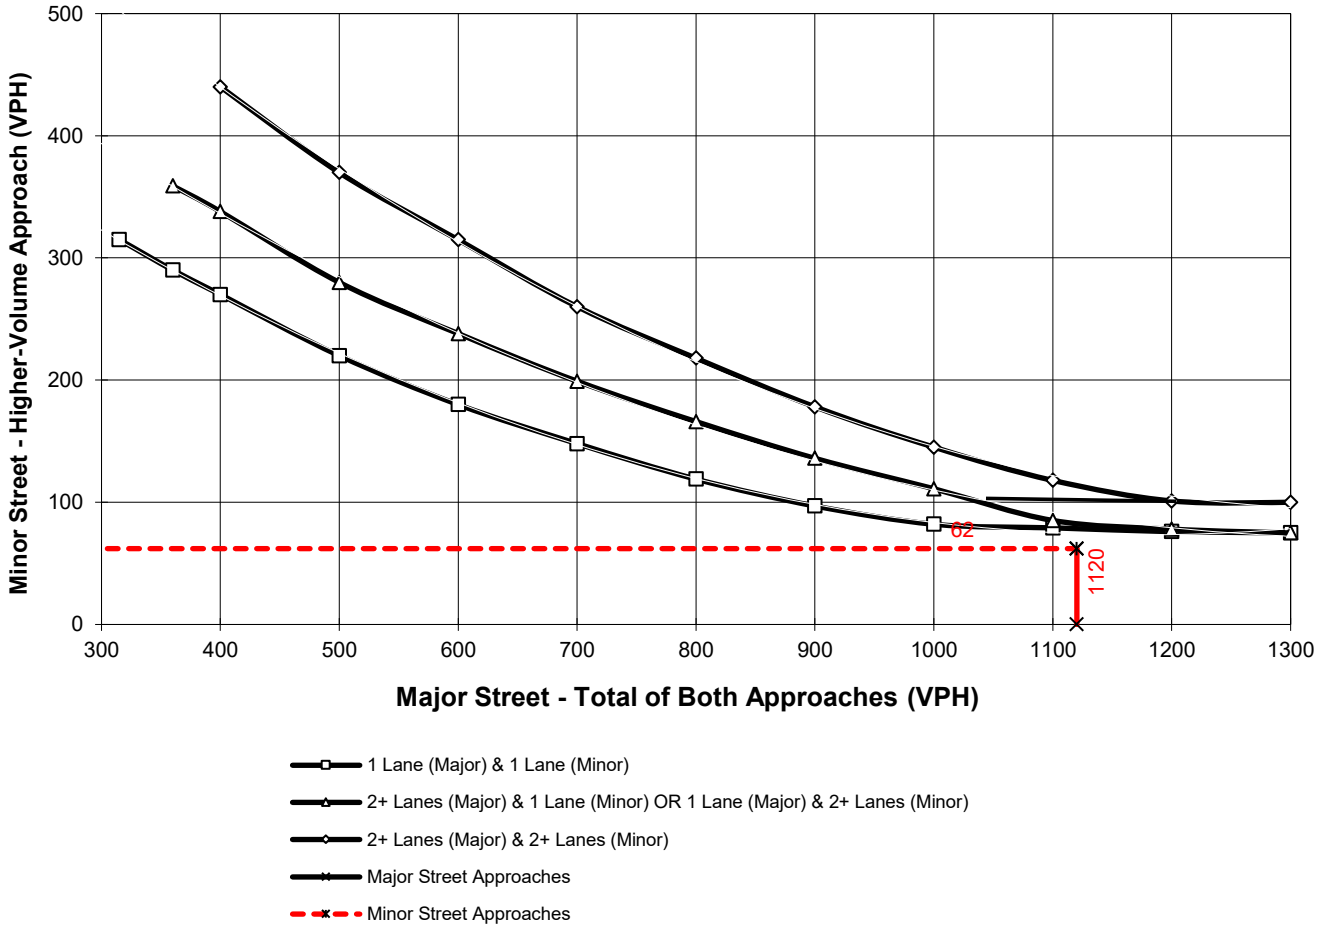
APPENDIX 5.3: OPENING YEAR CUMULATIVE (2026) WITH PROJECT CONDITIONS TRAFFIC SIGNAL WARRANT ANALYSIS WORKSHEETS

This Page Intentionally Left Blank

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)



(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 64 km/h OR ABOVE 40 mph ON MAJOR STREET)

Traffic Conditions = **Opening Year Cumulative (2026) Conditions - Weekday AM Peak Hour**

Major Street Name = **Lampson Av.**
Total of Both Approaches (VPH) = **1120**
Number of Approach Lanes Major Street = **2**

Minor Street Name = **Driveway 2**
High Volume Approach (VPH) = **62**
Number of Approach Lanes Minor Street = **1**

SIGNAL WARRANT NOT SATISFIED

*Note: 100 vph applies as the lower threshold for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold for a minor-street approach with one lane

Figure 4C-103 (CA). Traffic Signal Warrants Worksheet
(Average Traffic Estimate Form)

DIST	CO	RTE	PM	TRAFFIC CONDITIONS		**2026 WP**
				CALC CS	DATE	02/01/23
Jurisdiction: **City of Seal Beach/Los Alamitos**				CHK CS	DATE	02/01/23
Major Street: **Lampson Av.**				Critical Approach Speed (Major)		45 mph
Minor Street: **Driveway 2**				Critical Approach Speed (Minor)		25 mph

Major Street Approach Lanes = **2** lane Minor Street Approach Lanes = **1** lane

Major Street Future ADT = **14,416** vpd Minor Street Future ADT = **623** vpd

Speed limit or critical speed on major street traffic > 64 km/h (40 mph); ..... √

or

In built up area of isolated community of < 10,000 population .....

RURAL (R)

(Based on Estimated Average Daily Traffic - See Note)

URBAN / RURAL	Number of lanes for moving traffic on each approach		Minimum Requirements EADT			
			Vehicles Per Day on Major Street (Total of Both Approaches)		Vehicles Per Day on Higher-Volume Minor Street Approach (One Direction Only)	
	Major Street	Minor Street	Urban	Rural	Urban	Rural
CONDITION A - Minimum Vehicular Volume						
Satisfied / Not Satisfied XX						
	1	*1*	8,000	5,600	2,400	1,680
	2 + **14,416**	*1* **623**	9,600	6,720 *	2,400	1,680
	2 +	*2* +	9,600	6,720	3,200	2,240
	1	*2* +	8,000	5,600	3,200	2,240
CONDITION B - Interruption of Continuous Traffic						
Satisfied / Not Satisfied XX						
	1	*1*	12,000	8,400	1,200	850
	2 + **14,416**	*1* **623**	14,400	10,080 *	1,200	850
	2 +	*2* +	14,400	10,080	1,600	1,120
	1	*2* +	12,000	8,400	1,600	1,120
Combination of CONDITIONS A + B						
Satisfied / Not Satisfied XX			2 CONDITIONS 80%		2 CONDITIONS 80%	
No one condition satisfied, but following conditions fulfilled 80% of more	**A** 37%	**B** 73%				

Note: To be used only for NEW INTERSECTIONS or other locations where it is not reasonable to count actual traffic volumes.

The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal.

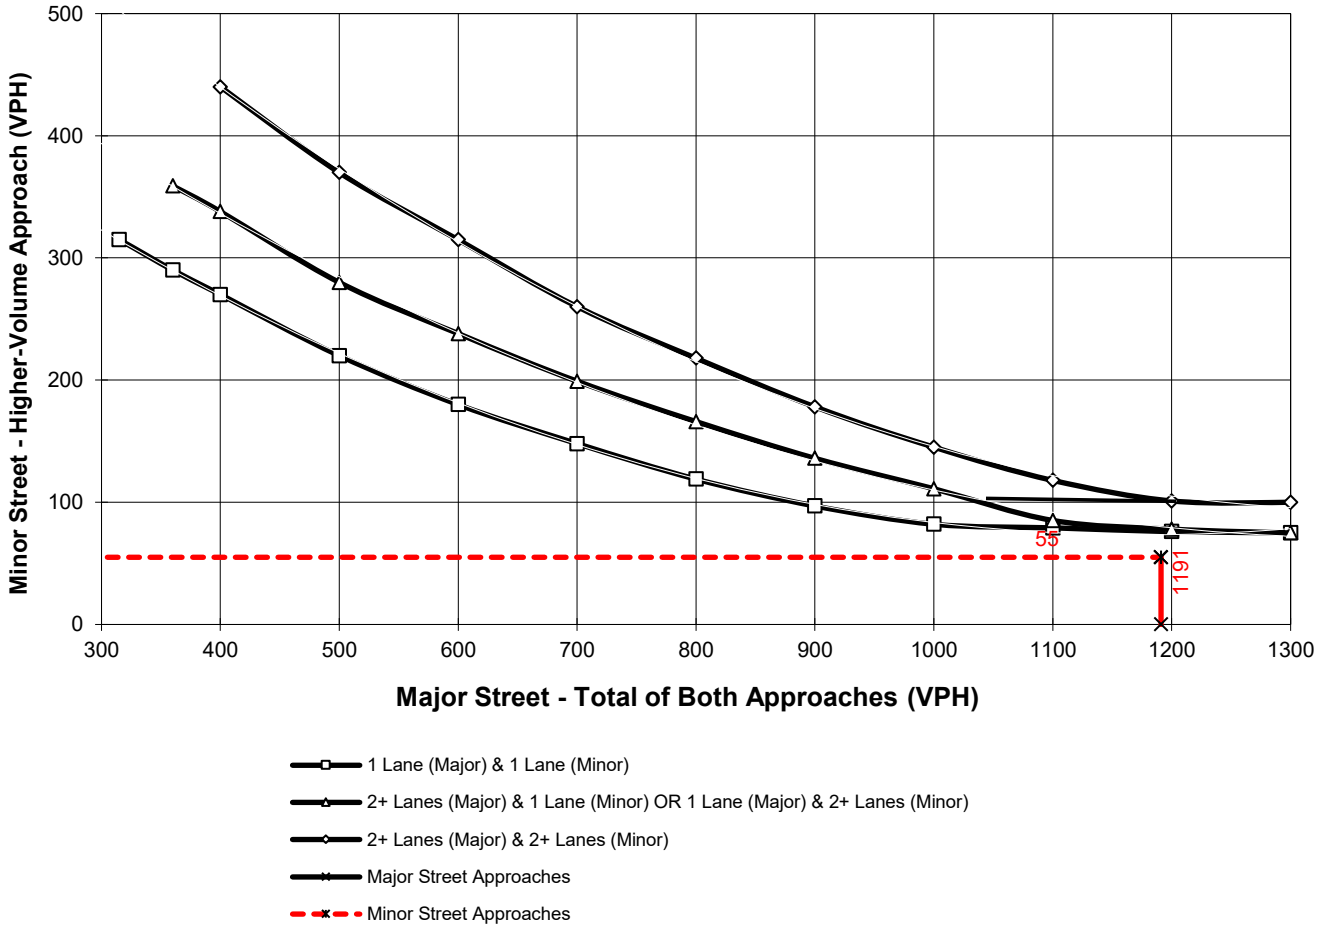
APPENDIX 6.3: GENERAL PLAN BUILDOUT WITH PROJECT CONDITIONS TRAFFIC SIGNAL WARRANT ANALYSIS WORKSHEETS

This Page Intentionally Left Blank

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)



(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 64 km/h OR ABOVE 40 mph ON MAJOR STREET)

Traffic Conditions = **General Plan Buildout Conditions - Weekday AM Peak Hour**

Major Street Name = **Lampson Av.**
Total of Both Approaches (VPH) = **1191**
Number of Approach Lanes Major Street = **2**

Minor Street Name = **Driveway 2**
High Volume Approach (VPH) = **55**
Number of Approach Lanes Minor Street = **1**

SIGNAL WARRANT NOT SATISFIED

*Note: 100 vph applies as the lower threshold for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold for a minor-street approach with one lane

Figure 4C-103 (CA). Traffic Signal Warrants Worksheet
(Average Traffic Estimate Form)

DIST	CO	RTE	PM	TRAFFIC CONDITIONS		GPBO WP
				CALC CS	DATE	07/01/24
Jurisdiction: City of Seal Beach/Los Alamitos				CHK CS	DATE	07/01/24
Major Street: Lampson Av.				Critical Approach Speed (Major)		45 mph
Minor Street: Driveway 2				Critical Approach Speed (Minor)		25 mph

Major Street Approach Lanes = **2** lane Minor Street Approach Lanes **1** lane

Major Street Future ADT = **15,316** vpd Minor Street Future ADT = **578** vpd

Speed limit or critical speed on major street traffic > 64 km/h (40 mph); ..... √

or

In built up area of isolated community of < 10,000 population .....

RURAL (R)

(Based on Estimated Average Daily Traffic - See Note)

URBAN / RURAL	Minimum Requirements EADT: Vehicles Per Day on Major Street (Total of Both Approaches)		Minimum Requirements EADT: Vehicles Per Day on Higher-Volume Minor Street Approach (One Direction Only)	
CONDITION A - Minimum Vehicular Volume	Urban	Rural	Urban	Rural
Satisfied / Not Satisfied: XX / XX				
Number of lanes for moving traffic on each approach: Major Street / Minor Street				
1 / *1*	8,000	5,600	2,400	1,680
2 + **15,316** / *1* **578**	9,600	6,720 *	2,400	1,680
2 + / *2* +	9,600	6,720	3,200	2,240
1 / *2* +	8,000	5,600	3,200	2,240
CONDITION B - Interruption of Continuous Traffic	Urban	Rural	Urban	Rural
Satisfied / Not Satisfied: XX				
Number of lanes for moving traffic on each approach: Major Street / Minor Street				
1 / *1*	12,000	8,400	1,200	850
2 + **15,316** / *1* **578**	14,400	10,080 *	1,200	850
2 + / *2* +	14,400	10,080	1,600	1,120
1 / *2* +	12,000	8,400	1,600	1,120
Combination of CONDITIONS A + B				
Satisfied / Not Satisfied: XX				
No one condition satisfied, but following conditions fulfilled 80% of more ..... A: 34% B: 68%	2 CONDITIONS 80%		2 CONDITIONS 80%	

Note: To be used only for NEW INTERSECTIONS or other locations where it is not reasonable to count actual traffic volumes.

The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal.

1 INTRODUCTION

This report presents the results of the Traffic Analysis (TA) for 4665 Lampson Avenue ("Project"), which is located in the City of Los Alamitos but adjacent to the City of Seal Beach, as shown on Exhibit 1-1. The purpose of this TA is to evaluate the potential circulation system deficiencies that may result from the development of the proposed Project, and where necessary recommend improvements to achieve acceptable operations consistent with General Plan level of service goals and policies. Although the proposed Project is located in the City of Los Alamitos, access to the site via Lampson Avenue lies within the City of Seal Beach's jurisdiction. This traffic study has been prepared in accordance with the City of Los Alamitos' requirements and the City of Seal Beach's Transportation Analysis Guidelines (June 2020, referred to as City Guidelines) as the study area intersections lie within the City of Seal Beach. (1) The Project traffic study scoping agreement is provided in Appendix 1.1 of this TA, which has been reviewed and approved by the City of Los Alamitos and City of Seal Beach.

1.1 SUMMARY OF FINDINGS

The Project is to construct the following improvements as design features in conjunction with development of the site:

- Project to implement stop controls for the southbound approach at all driveways on Lampson Avenue. Driveway 1 is proposed to be restricted to right-in/right-out access only and a median will need to be constructed to restrict the access. Access to Driveway 2 will allow for full access. For the purposes of this TA, no traffic signal has been recommended at Driveway 2 as it does not meet peak hour warrants and the intersection has been evaluated as a cross-street stop-controlled intersection.
- The Project frontage roadway of Lampson Avenue is currently constructed to its ultimate General Plan roadway classification. As such, frontage improvements will be limited to sidewalks, driveway modifications needed to accommodate site access, and landscaping improvements as required by City standards. The design of Lampson Avenue should meet the City of Seal Beach's criteria.

Additional details and intersection lane geometrics are provided in Section 1.6 Recommendations of this report.

1.2 PROJECT OVERVIEW

The Project consists of the development of 55 single family detached residential dwelling units (cluster homes), 114 multifamily (low-rise) residential dwelling units, and 77 affordable apartment dwelling units (total of 246 dwelling units). A preliminary site plan for the proposed Project is shown on Exhibit 1-2. Access to the Project site will be accommodated to Lampson Avenue via two proposed driveways. The site is currently occupied by the California Department of Fish and Wildlife building and parking lot; however, no credit has been taken for the existing use for the purposes of this traffic study in an effort to conduct a conservative analysis. The Project is anticipated to have an Opening Year of 2026.

In order to develop the traffic characteristics of the proposed project, trip-generation statistics published in the Institute of Transportation Engineers (ITE) Trip Generation Manual (11th Edition, 2021). (2) The Project is anticipated to generate an increase of 1,658 two-way trip-ends per day with 112 AM peak hour trips and 147 PM peak hour trips. The assumptions and methods used to estimate the Project's trip generation characteristics are discussed in greater detail in Section 4.1 Project Trip Generation of this report.

EXHIBIT 1-1: LOCATION MAP

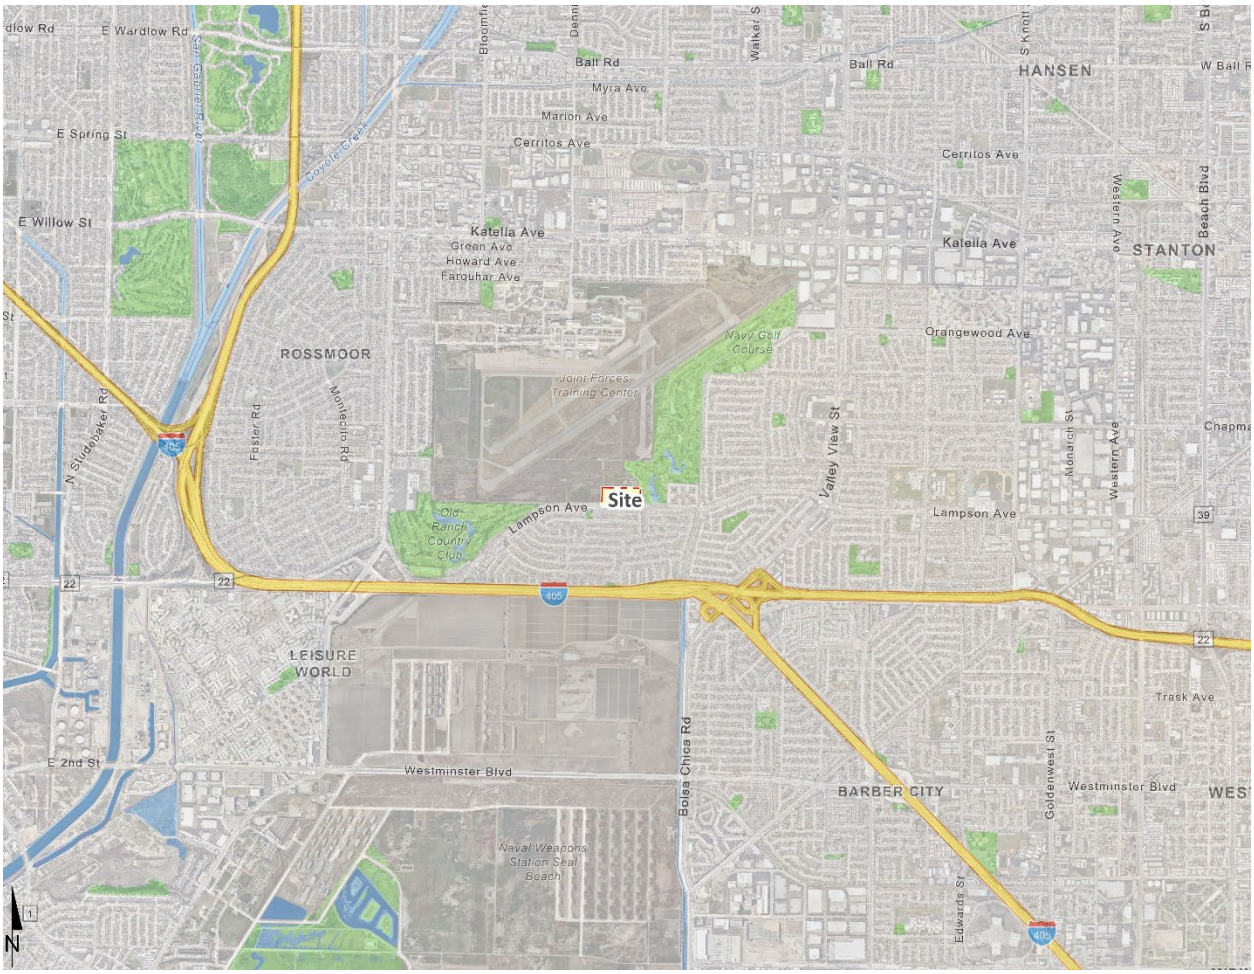

EXHIBIT 1-2: PRELIMINARY SITE PLAN

1.3 ANALYSIS SCENARIOS

For the purposes of this traffic study, potential deficiencies to traffic and circulation have been assessed for each of the following conditions:

- Existing (2022) Conditions
- Opening Year Cumulative (2026) Without Project
- Opening Year Cumulative (2026) With Buildout
- General Plan Buildout (2045) Without Project
- General Plan Buildout (2045) With Project

The General Plan Buildout volumes have been developed using the Orange County Transportation Analysis Model (OCTAM).

1.3.1 EXISTING (2022) CONDITIONS

Information for Existing (2022) conditions is disclosed to represent the baseline traffic conditions as they existed at the time this report was prepared.

1.3.2 OPENING YEAR CUMULATIVE (2026) CONDITIONS

The Opening Year Cumulative (2026) traffic conditions analyses determine the potential near-term cumulative circulation system deficiencies. The roadway network is similar to Existing conditions except for new connections to be constructed by other known cumulative projects or the Project. To account for background traffic growth, an ambient growth factor from Existing (2022) conditions of 8.24% (2 percent per year, compounded over 4 years) is included for Opening Year Cumulative (2026) traffic conditions.

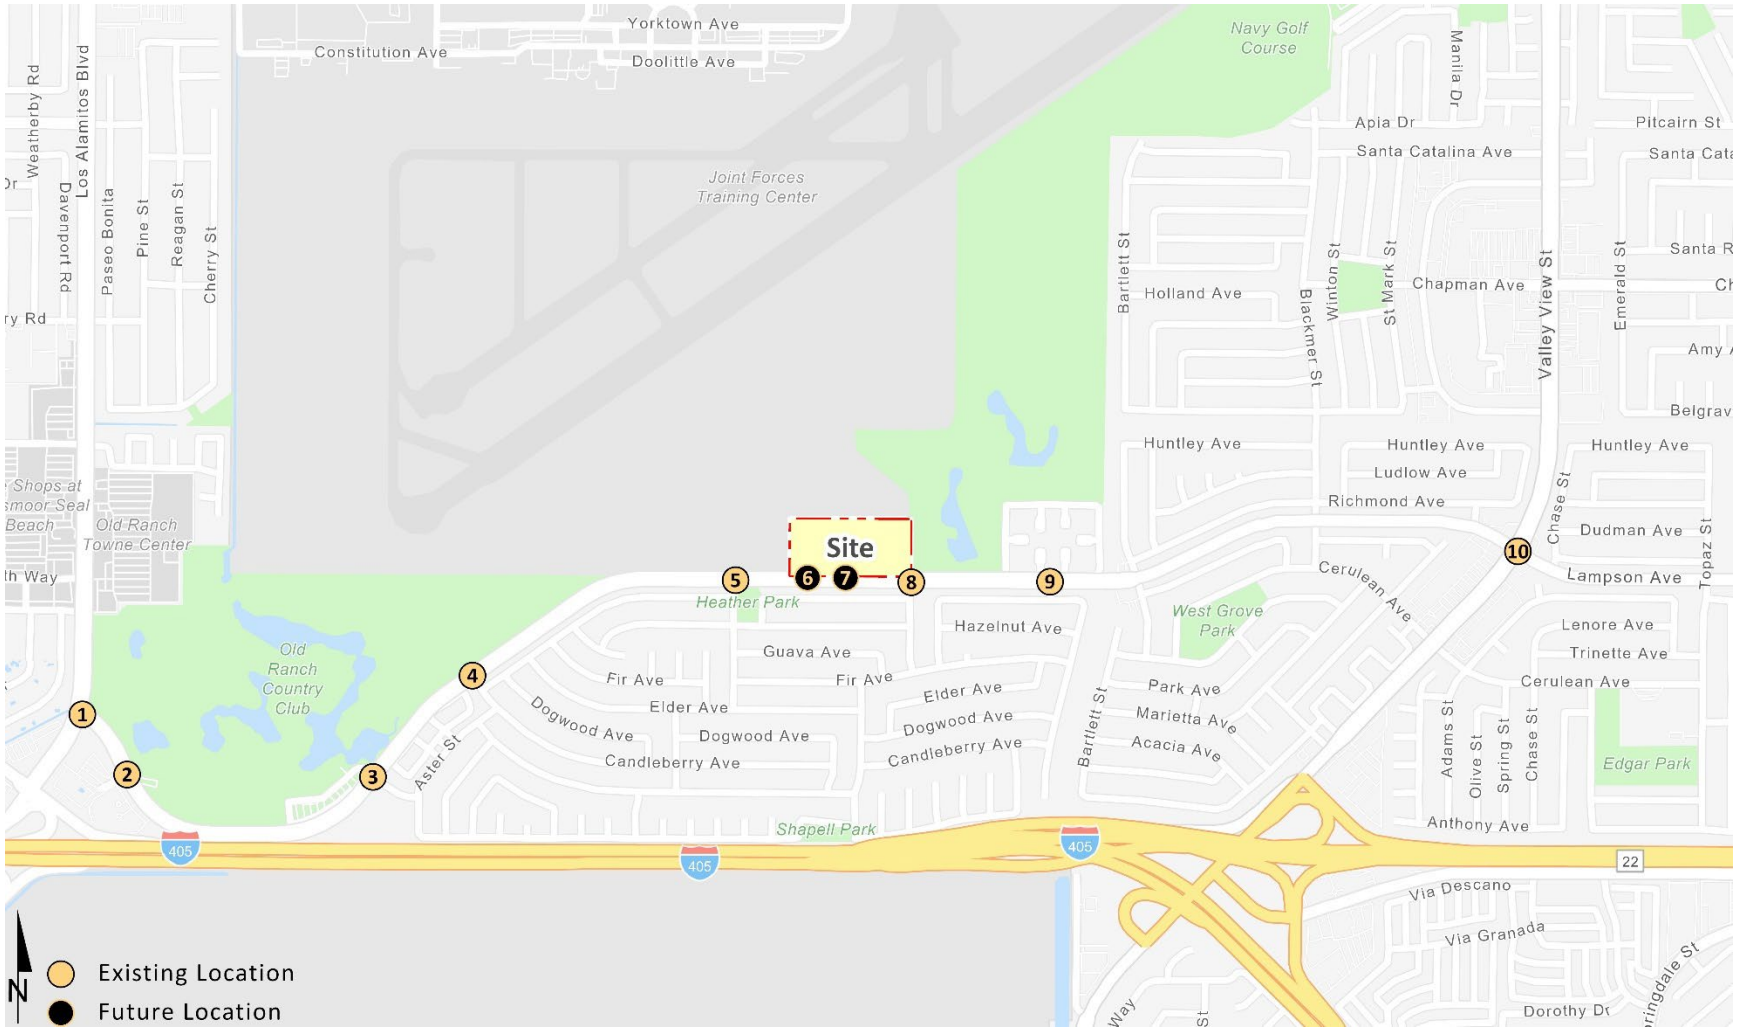
Conservatively, this TA estimates the area ambient traffic growth and then adds traffic generated by other known or probable related projects. These related projects are at least in part already accounted for in the assumed ambient growth rates; and some of these related projects may not be implemented and operational within the 2026 Opening Year timeframe assumed for the Project. The resulting traffic growth utilized in the TA (ambient growth factor plus traffic generated by related projects) would therefore tend to overstate rather than understate background cumulative traffic deficiencies under 2026 conditions.

1.3.3 GENERAL PLAN BUILDOUT CONDITIONS

The General Plan Buildout traffic conditions analyses determine the potential long-range cumulative circulation system deficiencies. The roadway network is similar to Existing conditions except for new connections to be constructed by other known cumulative projects or the Project. Traffic forecasts for General Plan Buildout traffic conditions for the intersections of Seal Beach Boulevard at Lampson Avenue and Valley View Street at Lampson Avenue have been developed using OCTAM. However, all other remaining study area intersections are not reflected in the traffic model. As such, the traffic volumes at all remaining study intersections have been forecasted by applying an ambient growth factor from Existing (2022) conditions of 14% in conjunction with the traffic generated by other known or probable related projects. This growth is based on the growth observed between Existing and General Plan Buildout conditions for the two intersections that are included in the OCTAM model.

The General Plan Buildout conditions analysis will be utilized to determine if improvements needed to accommodate the long-range cumulative traffic at the target Level of Service (LOS) identified in the City of Los Alamitos (lead agency) and City of Seal Beach General Plans. (3) (4)

1.4 STUDY AREA



To ensure that this TA satisfies the City of Los Alamitos and City of Seal Beach's traffic study requirements, Urban Crossroads, Inc. prepared a Project traffic study scoping package for review by both agencies prior to the preparation of this report. This agreement provides an outline of the Project study area, trip generation, trip distribution, and analysis methodology. The agreement approved by both Cities is included in Appendix 1.1 of this TA.

The 10 study area intersections shown on Exhibit 1-3 and listed in Table 1-1 were selected for evaluation in this TA based on consultation with both agencies during the scoping process. The intent of a Congestion Management Program (CMP) is to more directly link land use, transportation, and air quality, thereby prompting reasonable growth management programs that will effectively utilize new transportation funds, alleviate traffic congestion and related deficiencies, and improve air quality. The Orange County CMP became effective with the passage of Proposition 111 in 1990 and most recently updated in 2021. The Orange County Transportation Authority (OCTA) adopted the 2021 CMP for the County of Orange in November 2021. (5) There are no CMP intersections within the study area.

TABLE 1-1: INTERSECTION ANALYSIS LOCATIONS

#	Intersection	Jurisdiction	CMP?
1	Seal Beach Bl. & Lampson Av.	Seal Beach	No
2	Old Ranch Plaza & Lampson Av.	Seal Beach	No
3	Basswood St. & Lampson Av.	Seal Beach	No
4	Candleberry Av. & Lampson Av.	Seal Beach	No
5	Heather St. & Lampson Av.	Seal Beach/Los Alamitos	No
6	Driveway 1 & Lampson Av.	Seal Beach/Los Alamitos	No
7	Driveway 2 & Lampson Av.	Seal Beach/Los Alamitos	No
8	Rose St. & Lampson Av.	Seal Beach/Los Alamitos	No
9	Tulip St. & Lampson Av.	Seal Beach/Los Alamitos	No
10	Valley View St. & Lampson Av.	Garden Grove	No

EXHIBIT 1-3: STUDY AREA

For the purposes of this TA, a total of 9 study area roadway segments were selected for evaluation based on City of Seal Beach's Guidelines which requires analysis of any roadway segment where a project contributes one percent or more of the total traffic on the segment. Table 1-2 provides a list of study area roadway segment analysis locations.

TABLE 1-2: ROADWAY SEGMENT ANALYSIS LOCATIONS

#	Roadway	Segment Limits
1	Seal Beach Bl.	South of Lampson Av.
2	Lampson Av.	Seal Beach Bl. to Old Ranch Plaza
3	Lampson Av.	Old Ranch Plaza to Basswood St.
4	Lampson Av.	Basswood St. to Candleberry Av.
5	Lampson Av.	Candleberry Av. to Heather St.
6	Lampson Av.	Heather St. to Rose St.
7	Lampson Av.	Rose St. to Tulip St.
8	Lampson Av.	Tulip St. to Valley View St.
9	Lampson Av.	East of Valley View St.

1.5 DEFICIENCIES

This section provides a summary of deficiencies by analysis scenario. Section 2 Methodologies provides information on the methodologies used in the analysis and Section 3 Area Conditions, Section 5 Opening Year Cumulative (2026) Traffic Conditions, and Section 6 General Plan Buildout Traffic Conditions includes the detailed analyses. A summary of LOS results for all analysis scenarios are presented in Table 1-3.

1.5.1 EXISTING (2022) CONDITIONS

The study area intersections are currently operating at an acceptable LOS during the peak hours.

1.5.2 OPENING YEAR CUMULATIVE (2026) CONDITIONS

The following study area intersection is anticipated to operate at an unacceptable LOS during the peak hours under Opening Year Cumulative (2026) With Project traffic conditions (see Table 1-3):

- Seal Beach Bl. & Lampson Av. (#1) – LOS E PM peak hour only

The addition of Project traffic is anticipated to increase the volume-to-capacity (v/c) ratio by more than 0.01 at the intersection of Seal Beach Boulevard and Lampson Avenue.

TABLE 1-3: SUMMARY OF LOS

#	Intersection	Existing (2022) AM	Existing (2022) PM	2026 Without Project AM	2026 Without Project PM	2026 With Project AM	2026 With Project PM	GPBO Without Project AM	GPBO Without Project PM	GPBO With Project AM	GPBO With Project PM

[1] Based on HCM methodology.

1.5.3 GENERAL PLAN BUILDOUT CONDITIONS

The following study area intersection is anticipated to continue to operate at an unacceptable LOS during the peak hours under General Plan Buildout Without Project traffic conditions (see Table 1-3):

- Seal Beach Bl. & Lampson Av. (#1) – LOS F AM and PM peak hours

There are no additional study area intersections anticipated to operate at an unacceptable LOS during the peak hours with the addition of Project traffic, in addition to the locations identified for General Plan Buildout Without Project traffic conditions. Similar to Opening Year Cumulative traffic conditions, the addition of Project traffic is anticipated to increase the v/c ratio by more than 0.01 at the intersection of Seal Beach Boulevard and Lampson Avenue under General Plan Buildout With Project traffic conditions.

1.6 RECOMMENDATIONS

1.6.1 SITE ADJACENT AND SITE ACCESS RECOMMENDATIONS

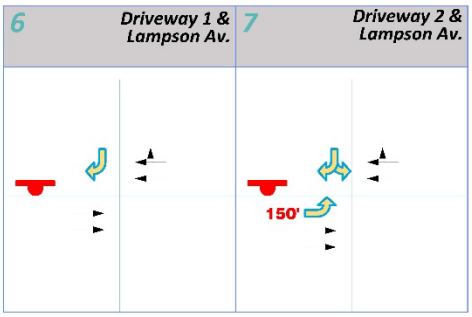
The following recommendations are based on the minimum improvements needed to accommodate site access and maintain acceptable peak hour operations for the proposed Project. The driveway intersection recommendations are shown on Exhibit 1-4 and roadway improvements are summarized below.

Driveway 1 & Lampson Avenue (#6) – Project to implement a stop control for egress traffic at Driveway 1 on Lampson Avenue. The intersection is proposed to be restricted to right-in/right-out access only. The access at this driveway should be controlled by a raised median.

Driveway 2 & Lampson Avenue (#7) – Driveway 2 is not anticipated to meet a peak hour or planning level (daily volume) based traffic signal warrant under any of the analysis scenarios. A minimum of 150-feet should be accommodated for the eastbound left turn into the Project.

The Project frontage roadway of Lampson Avenue is currently constructed to its ultimate General Plan roadway classification. As such, frontage improvements will be limited to sidewalk improvements, driveway modifications to accommodate site access, and landscaping improvements as required by City standards.

Wherever necessary, roadways adjacent to the Project, site access points and site-adjacent intersections will be constructed to be consistent with the identified roadway classifications and respective cross-sections in the City of Los Alamitos General Plan Circulation Element.



On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the Project site.

1.6.2 OFF-SITE RECOMMENDATIONS

The recommended improvements needed to address the cumulative deficiency identified under Opening Year Cumulative (2026) and General Plan Buildout traffic conditions are shown in Table 1-4. The Project Applicant's responsibility for the Project's contributions towards deficient intersections is fulfilled through payment of fair share that would be assigned to construction of the identified recommended improvements.

EXHIBIT 1-4: SITE ACCESS RECOMMENDATIONS

0 = Future Intersection Analysis Location
= Stop Sign
= Existing Lane
= Lane Improvement
150' = Recommended Turn Pocket Length

TABLE 1-4: SUMMARY OF INTERSECTION IMPROVEMENTS

#	Intersection Location	Jurisdiction	Analysis Scenarios		Improvements included in Fee Program?	Mechanism for Improvement[1]	Fair Share %[2]
			2026 With Project	GPBO With Project			
1	Seal Beach Bl. & Lampson Av.	Seal Beach	Restripe the number 2 WB left as a shared left-right turn lane	Same	No	Fair Share	5.1%

[1] Identifies the Project's responsibility to construct an improvement or contribute fair share or fee payment towards the implementation of the improvements shown. If identified as a Project construct obligation, then no fair share percentage has been identified.

[2] Program improvements constructed may be eligible for fee credit, at discretion of City. See Table 7-1 for Fair Share Calculations.

1.7 QUEUING ANALYSIS

A queuing analysis has been performed for the Project driveways on Lampson Avenue under General Plan Buildout With Project traffic conditions. Both Driveway 1 and Driveway 2 on Lampson Avenue are evaluated assuming cross-street stop-controlled intersections for the purposes of the queuing assessment. The traffic modeling and signal timing optimization software package SimTraffic has been utilized to assess the queues. SimTraffic is designed to model networks of signalized and unsignalized intersections, with the primary purpose of checking and fine-tuning signal operations. SimTraffic uses the input parameters from Synchro to generate random simulations. These random simulations generated by SimTraffic have been utilized to determine the 95th percentile queue lengths observed for each applicable turn lane. The SimTraffic simulation has been recorded 5 times, during the weekday AM and PM peak hours, and has been seeded for 15-minute periods with 60-minute recording intervals. Queuing analysis worksheets for the weekday AM and PM peak hours are provided in Appendix 1.2 of this report for General Plan Buildout With Project traffic conditions.

As shown in Table 1-5, no site adjacent queues are anticipated under General Plan Buildout traffic conditions. An eastbound left turn lane with a minimum of 150-feet of storage at Driveway 2 is anticipated to sufficiently accommodate 95th percentile peak hour queues.

TABLE 1-5: PEAK HOUR QUEUING SUMMARY FOR GENERAL PLAN BUILDOUT CONDITIONS

#	Intersection	Movement	Available Stacking Distance (Feet)	95th Percentile Queue (Feet) AM Peak Hour	95th Percentile Queue (Feet) PM Peak Hour	Acceptable? [1] AM	Acceptable? [1] PM
6	Driveway 1 & Lampson Av.	SBR	100	39	37	Yes	Yes
7	Driveway 2 & Lampson Av.	SBL/R	100	58	60	Yes	Yes
		EBL	150	23	42	Yes	Yes
		WBT	520	0	3	Yes	Yes

* SB = Southbound, EB = Eastbound, WB = Westbound, L = Left, T = Through, R = Right

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 25 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

1.8 PEDESTRIAN & BICYCLE FACILITIES

As noted previously, frontage improvements will include sidewalk improvements, driveway modifications to accommodate site access, and landscaping improvements as required by City standards. The proposed sidewalk along the Project's frontage on the north side of Lampson Avenue will provide connectivity with proposed sidewalks and paths internal to the Project. The Project should also maintain the existing Class II (on-street, striped) bike lanes along its frontage on Lampson Avenue.

2 METHODOLOGIES

This section of the report presents the methodologies used to perform the traffic analyses summarized in this report. The methodologies described are consistent with City Guidelines.

2.1 LEVEL OF SERVICE

Traffic operations of roadway facilities are described using the term "Level of Service" (LOS). LOS is a qualitative description of traffic flow based on several factors, such as speed, travel time, delay, and freedom to maneuver. Six levels are typically defined ranging from LOS A, representing completely free-flow conditions, to LOS F, representing breakdown in flow resulting in stop-and-go conditions. LOS E represents operations at or near capacity, an unstable level where vehicles are operating with the minimum spacing for maintaining uniform flow.

2.2 INTERSECTION CAPACITY ANALYSIS

The definitions of LOS for interrupted traffic flow (flow restrained by the existence of traffic signals and other traffic control devices) differ slightly depending on the type of traffic control.

2.2.1 SIGNALIZED INTERSECTIONS

The City of Los Alamitos requires signalized CMP intersections to be evaluated through ICU analysis which compares the peak hour traffic volumes to intersection capacity. Lane capacities of 1,600 vehicles per hour of green time (left turn and shared lanes) and 1,700 vehicles per hour of green time (through and right turn lanes) for the ICU calculations. 0.10 has been assumed representing 10 percent for the yellow clearance/lost time and inherent vehicle delay between cycles with an assumed signal cycle of 100 seconds. The ICU LOS definitions based on volume to capacity (v/c) ratio are presented in Table 2-1. The Traffix software package has been utilized to evaluate the signalized intersections using the ICU methodology with the analysis parameters discussed above.

TABLE 2-1 INTERSECTION CAPACITY UTILIZATION (ICU) LOS DEFINITIONS

Level of Service	Critical Volume to Capacity Ratio
A	0.00 - 0.60
B	0.61 - 0.70
C	0.71 - 0.80
D	0.81 - 0.90
E	0.91 - 1.00
F	>1.00

Source: 2021 OCTA CMP, Figure 1 (Chapter 2)

2.2.2 UNSIGNALIZED INTERSECTIONS

The City of Los Alamitos and City of Seal Beach require the operations of unsignalized intersections be evaluated using the methodology described in the HCM. (6) The LOS rating is based on the weighted average control delay expressed in seconds per vehicle (see Table 2-2). At two-way or side-street stop-controlled intersections, LOS is calculated for each controlled movement and for the left turn movement from the major street, as well as for the intersection as a whole. For approaches composed of a single lane, the delay is computed as the average of all movements in that lane. Delay for the intersection is reported for the worst individual movement at a two-way stop-controlled intersection. For all-way stop controlled intersections, LOS is computed for the intersection as a whole (average delay).

The LOS is typically dependent on the quality of traffic flow at the intersections along a roadway. The 6th Edition Highway Capacity Manual (HCM) methodology expresses the LOS at an intersection in terms of delay time for the various intersection approaches. (6) The HCM uses different procedures depending on the type of intersection control.

The traffic modeling and signal timing optimization software package Synchro (Version 11) has been utilized to analyze signalized intersections. Synchro is a microscopic traffic software program that is based on the signalized intersection capacity analysis as specified in the HCM. Equations are used to determine measures of effectiveness such as delay and queue length.

The peak hour traffic volumes have been adjusted using a peak hour factor (PHF) to reflect peak 15-minute volumes. Customary practice for LOS analysis is to use a peak 15-minute rate of flow. However, flow rates are typically expressed in vehicles per hour. The PHF is the relationship between the peak 15-minute flow rate and the full hourly volume (e.g., PHF = [Hourly Volume] / [4 x Peak 15-minute Flow Rate]). The use of a 15-minute PHF produces a more detailed analysis as compared to analyzing vehicles per hour. Existing PHFs have been used for all analysis scenarios. Per the HCM, PHF values over 0.95 often are indicative of high traffic volumes with capacity constraints on peak hour flows while lower PHF values are indicative of greater variability of flow during the peak hour. (6)

TABLE 2-2: UNSIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0[1]
Little or no delays.	0 to 10.00	A
Short traffic delays.	10.01 to 15.00	B
Average traffic delays.	15.01 to 25.00	C
Long traffic delays.	25.01 to 35.00	D
Very long traffic delays.	35.01 to 50.00	E
Extreme traffic delays with intersection capacity exceeded.	> 50.00	F

Source: HCM, 6th Edition

[1] If V/C is greater than 1.0 then LOS is F per HCM.

2.3 TRAFFIC SIGNAL WARRANT ANALYSIS METHODOLOGY

The term "signal warrants" refers to the list of established criteria used by the California Department of Transportation (Caltrans) and other public agencies to quantitatively justify or ascertain the potential need for installation of a traffic signal at an otherwise unsignalized intersection. This TA uses the signal warrant criteria presented in the latest edition of the Caltrans' California Manual on Uniform Traffic Control Devices (CA MUTCD), for all study area intersections. (7)

The signal warrant criteria for Existing study area intersections are based upon several factors, including volume of vehicular and pedestrian traffic, frequency of accidents, and location of school areas. The CA MUTCD indicates that the installation of a traffic signal should be considered if one or more of the signal warrants are met. (7) Specifically, this TA utilizes the Peak Hour Volume-based Warrant 3 as the appropriate representative traffic signal warrant analysis for existing traffic conditions. Rural warrants have been utilized for intersections located in communities with populations of less than 10,000 persons or with adjacent major streets operating above 40 miles per hour and urban warrants have been utilized for those that operate at less than 40 miles per hour. For the purposes of this study, the speed limit was the basis for determining whether Urban or Rural warrants were used for a given intersection.

Traffic signal warrant analyses were performed for the future unsignalized study area intersection of Driveway 2 at Lampson Avenue during the peak weekday conditions wherein the Project is anticipated to contribute the highest trips. All existing study area intersections are currently signalized, so traffic signal warrant analysis has not been performed for Existing traffic conditions. Driveway 1 on Lampson Avenue is proposed to be restricted to right-in/right-out access only. As such, traffic signal warrant analysis has not been performed for Driveway 1 as the installation of a signal at this location is not suitable based on its access and location with respect to other existing and proposed signalized intersections. The traffic signal warrant analyses for future conditions are presented in Section 5 Opening Year Cumulative (2026) Traffic Conditions and Section 6 General Plan Buildout Traffic Conditions of this report.

It is important to note that a signal warrant defines the minimum condition under which the installation of a traffic signal might be warranted. Meeting this threshold condition does not require that a traffic control signal be installed at a particular location, but rather, that other traffic factors and conditions be evaluated in order to determine whether the signal is truly justified. It should also be noted that signal warrants do not necessarily correlate with LOS. An intersection may satisfy a signal warrant condition and operate at or above acceptable LOS or operate below acceptable LOS and not meet a signal warrant.

2.4 ROADWAY SEGMENT CAPACITY ANALYSIS

Roadway segment operations have been evaluated using the City of Seal Beach's General Plan Roadway Segment capacity thresholds. These roadway capacities are "rule of thumb" estimates for planning purposes and are affected by such factors as intersections (spacing, configuration and control features), degree of access control, roadway grades, design geometrics (horizontal and vertical alignment standards), sight distance, vehicle mix (truck and bus traffic) and pedestrian and bicycle traffic. In other words, while using ADT for planning purposes is suitable with regards to evaluating potential volume to capacity with future forecasts, it is not suitable for operational analysis because it does not account for the factors listed previously. As such, where the ADT based roadway segment analysis indicates a potential roadway capacity deficiency (i.e., unacceptable LOS), a review of the

more detailed peak hour intersection analysis and progression analysis are undertaken. The more detailed peak hour intersection analysis explicitly accounts for factors that affect roadway capacity.

2.5 QUEUING ANALYSIS

The 95th percentile queuing of vehicles has been assessed at the intersections of Seal Beach Boulevard and Valley View Street along Lampson Avenue and all proximate freeway or state highway off-ramps to determine potential queuing deficiencies for the turning lanes. This queuing analysis has been conducted for General Plan Buildout traffic conditions only. Specifically, the queuing analysis is utilized to identify any potential queuing and "spill back" onto the adjacent arterial through lanes from the turn lanes. The traffic modeling and signal timing optimization software package SimTraffic has been utilized to assess the queues. SimTraffic is designed to model networks of signalized and unsignalized intersections, with the primary purpose of checking and fine-tuning signal operations. SimTraffic uses the input parameters from Synchro to generate random simulations. These random simulations generated by SimTraffic have been utilized to determine the 95th percentile queue lengths observed for each applicable turn lane. A SimTraffic simulation has been recorded up to 5 times, during the weekday AM and weekday PM peak hours, and has been seeded for 15-minute periods with 60-minute recording intervals.

2.6 LEVEL OF SERIVCE (LOS) CRITERIA

The City of Los Alamitos and City of Seal Beach have established LOS D as the minimum level of service for all roadways/intersections within the City. Therefore, any intersection operating at LOS E or F will be considered deficient for the purposes of this analysis.

2.7 DEFICIENCY CRITERIA

This section outlines the methodology used in this analysis related to identifying circulation system deficiencies.

2.7.1 CITY OF LOS ALAMITOS & CITY OF SEAL BEACH

To determine whether the addition of project traffic at a study intersection result in a deficiency, the following thresholds of significance will be utilized to determine when an intersection requires improvements:

Existing ICU	Project Related Increase in ICU
0.00 - 0.69	0.06
0.70 - 0.79	0.04
0.80 - 0.89	0.02
0.90+	0.01

2.7.2 CITY OF GARDEN GROVE

To determine whether the addition of project traffic at a study intersection result in a deficiency, the following thresholds of significance will be utilized:

- Any signalized study intersection operating at an acceptable LOS D or better without project in which the addition of project traffic causes the intersection to degrade to LOS E or F shall identify improvements to improve the operations to LOS D or better.
- Any signalized intersection that is operating at LOS E or F without project traffic where the project increases v/c by 0.010 or more shall identify improvements to offset the increase in delay.
- An operational improvement would be required if the study determines that either section a) or both sections b) and c) occur at unsignalized study intersections:

  a) The addition of project related traffic causes the intersection to degrade from an acceptable LOS D or better to LOS E or LOS F.

  AND

  b) The intersection meets the peak hour traffic signal warrant after the addition of project traffic.

2.8 PROJECT FAIR SHARE CALCULATION METHODOLOGY

For improvements that do not appear in a pre-existing fee program, a fair share contribution based on the Project's proportional share may be imposed in order to address the Project's share of deficiencies in lieu of construction. It should be noted that fair share calculations are for informational purposes only and the City's Traffic Engineer will determine the appropriate improvements to be implemented by a project (to be identified in the conditions of approval). The Project's fair share cost of improvements would be determined based on the following equation, which is the ratio of Project traffic to new traffic, where new traffic is total future traffic less existing baseline traffic:

Project Fair Share % = Project Traffic / (General Plan Buildout With Project Total Traffic – Existing (2022) Traffic)

The detailed Project fair share contribution calculations are presented in Section 7 Fair Share Calculations of this TA (see Table 7-1).

This page is intentionally left blank

3 AREA CONDITIONS

This section provides a summary of the existing circulation network, the City of Los Alamitos and City of Seal Beach General Plan Circulation Network, and a review of existing peak hour intersection operations analyses.

3.1 EXISTING CIRCULATION NETWORK

Pursuant to the scoping agreement (Appendix 1.1), the study area includes a total of 10 existing and future intersections as shown previously on Exhibit 1-3. Exhibit 3-1 illustrates the study area intersections located near the proposed Project and identifies the number of through traffic lanes for existing roadways and intersection traffic controls.

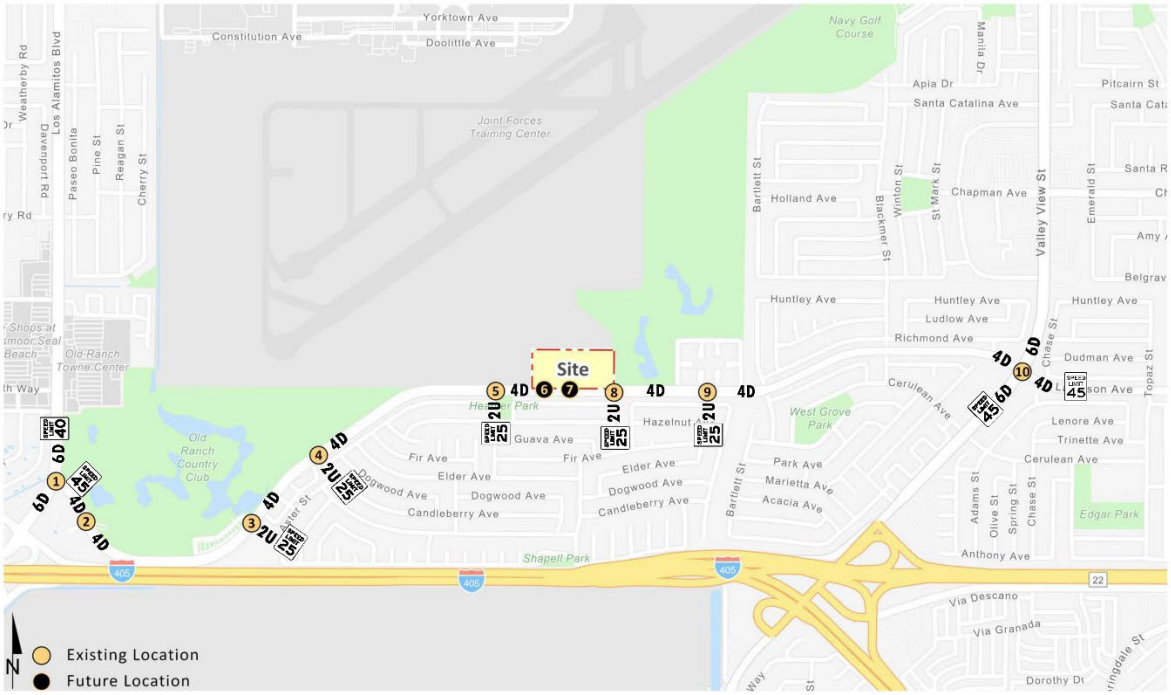
3.2 CITY OF LOS ALAMITOS GENERAL PLAN CIRCULATION ELEMENT

As noted previously, the Project site is located within the City of Los Alamitos. The roadway classifications and planned (ultimate) roadway cross-sections of the major roadways, as identified in the City of Los Alamitos General Plan Circulation Element, are described subsequently. Exhibit 3-2 shows the City of Los Alamitos General Plan Circulation Element and below is a summary of the major study area roadways and their General Plan classifications:

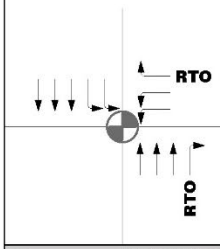
- Smart Street (right-of-way is 122-146-feet, typically 6 to 8-lane divided roadways)
- Major Arterial (right-of-way is 120-feet, typically 6-lane divided roadways)
- Primary Arterial (right-of-way is 100-120-feet, typically 4-lane divided roadways)
- Secondary Arterial (right-of-way is 80-feet, typically 4-lane undivided roadways)

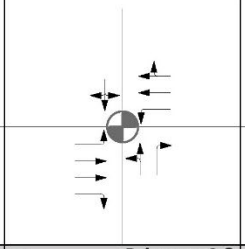
There are no classified City roadways within the study area.

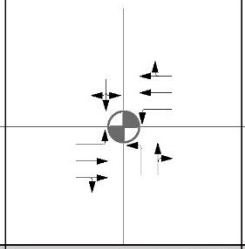
3.3 CITY OF SEAL BEACH

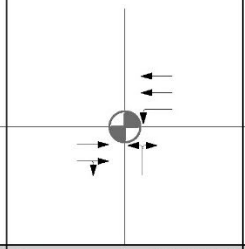


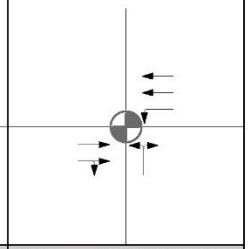
Although the Project site is located within the City of Los Alamitos, the majority of the study area lies within the City of Seal Beach. The roadway classifications and planned (ultimate) roadway cross-sections of the major roadways within the study area, as identified in the City of Seal Beach General Plan Circulation Element, are described subsequently. Exhibit 3-3 shows the City of Seal Beach General Plan Circulation Element and Below is a summary of the major study area roadways and their General Plan classifications:

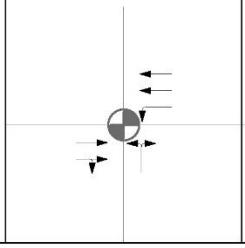


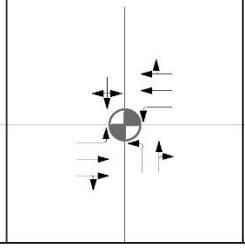


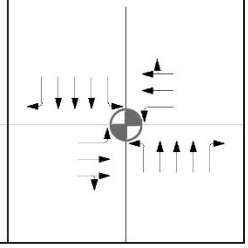












- Major Arterial (right-of-way is 120-feet, typically 6-lane divided roadways): Seal Beach Boulevard
- Primary Arterial (right-of-way is 100-feet, typically 4-lane divided roadways): None
- Secondary Arterial (right-of-way is 80-feet, typically 4-lane undivided roadways): Lampson Avenue
- Principal Roadways: Basswood Street, Candleberry Avenue, Heather Street, Rose Street, Tulip Street

3.4 BICYCLE & PEDESTRIAN FACILITIES

The City of Los Alamitos existing and planned bicycle network is shown on Exhibit 3-4 and the City of Seal Beach's is shown on Exhibit 3-5. There are existing Class II (on-street, striped) bike lanes on the north and south sides of Lampson Avenue from Basswood Street to the east. In addition, there is a Class I bike/pedestrian path on Seal Beach Boulevard north of Lampson Avenue and a Class II bike lane south of Lampson Avenue. The Project should maintain the existing Class II bike lane on Lampson Avenue along its frontage.

EXHIBIT 3-2: CITY OF LOS ALAMITOS GENERAL PLAN CIRCULATION ELEMENT

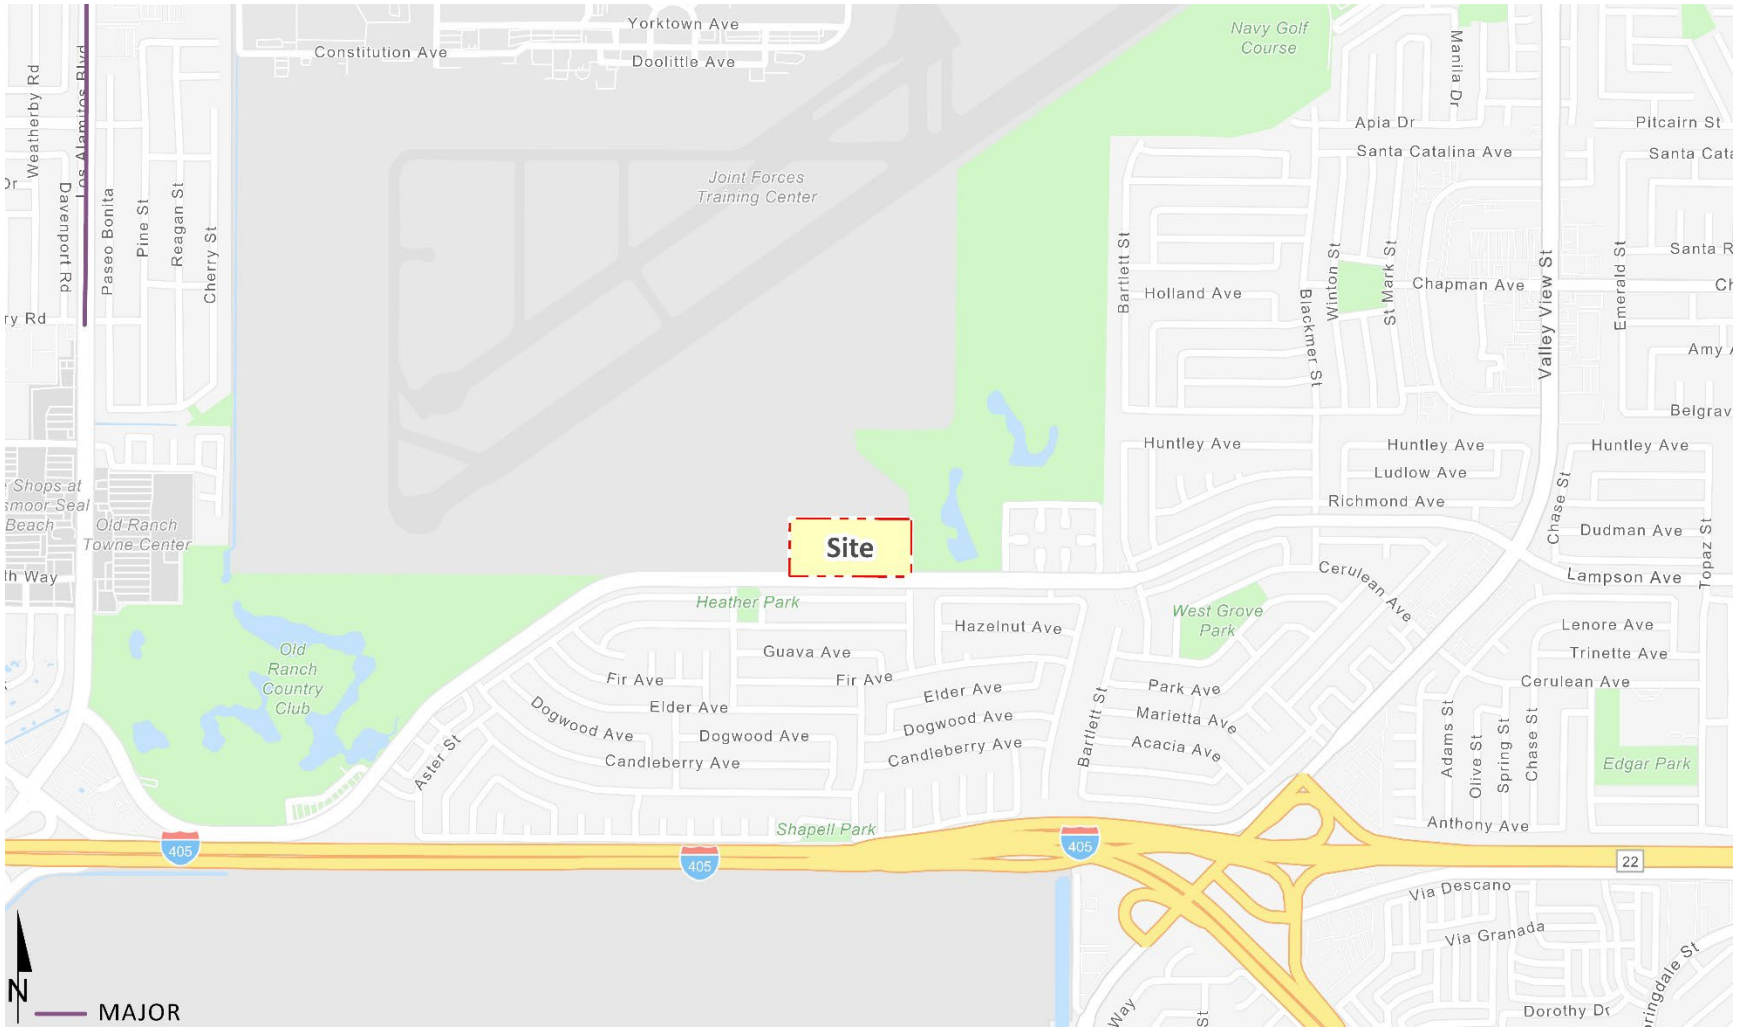

EXHIBIT 3-3: CITY OF SEAL BEACH GENERAL PLAN CIRCULATION ELEMENT

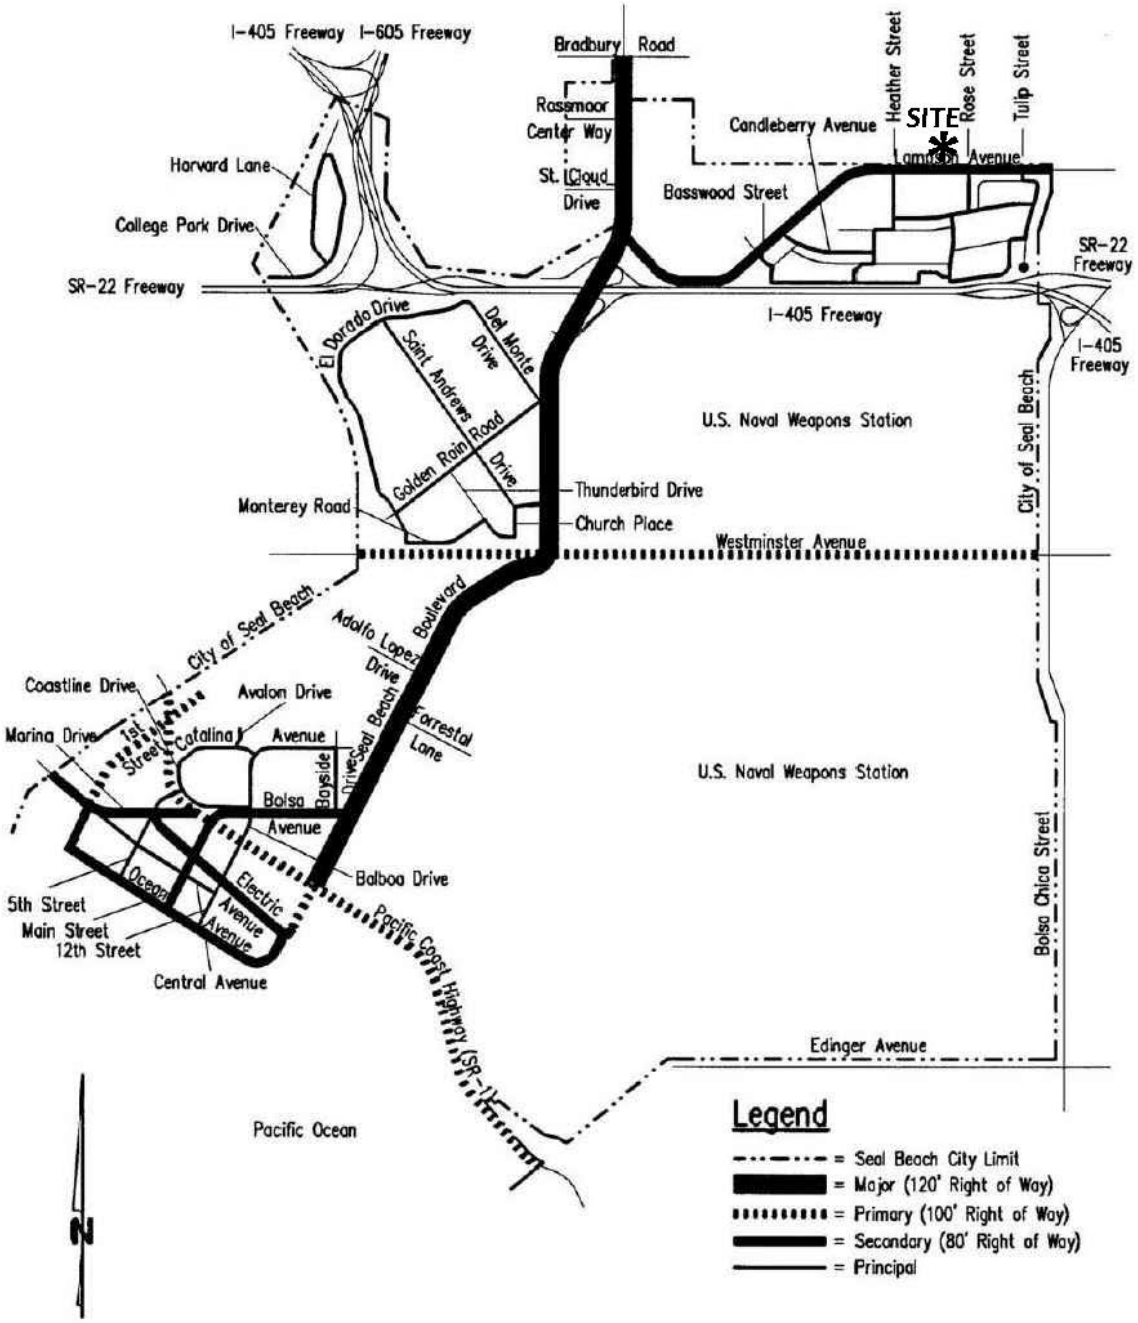

EXHIBIT 3-4: CITY OF LOS ALAMITOS EXISTING AND PLANNED BICYCLE NETWORK

EXHIBIT 3-5: CITY OF SEAL BEACH EXISITNG AND PLANNED BICYCLE NETWORK

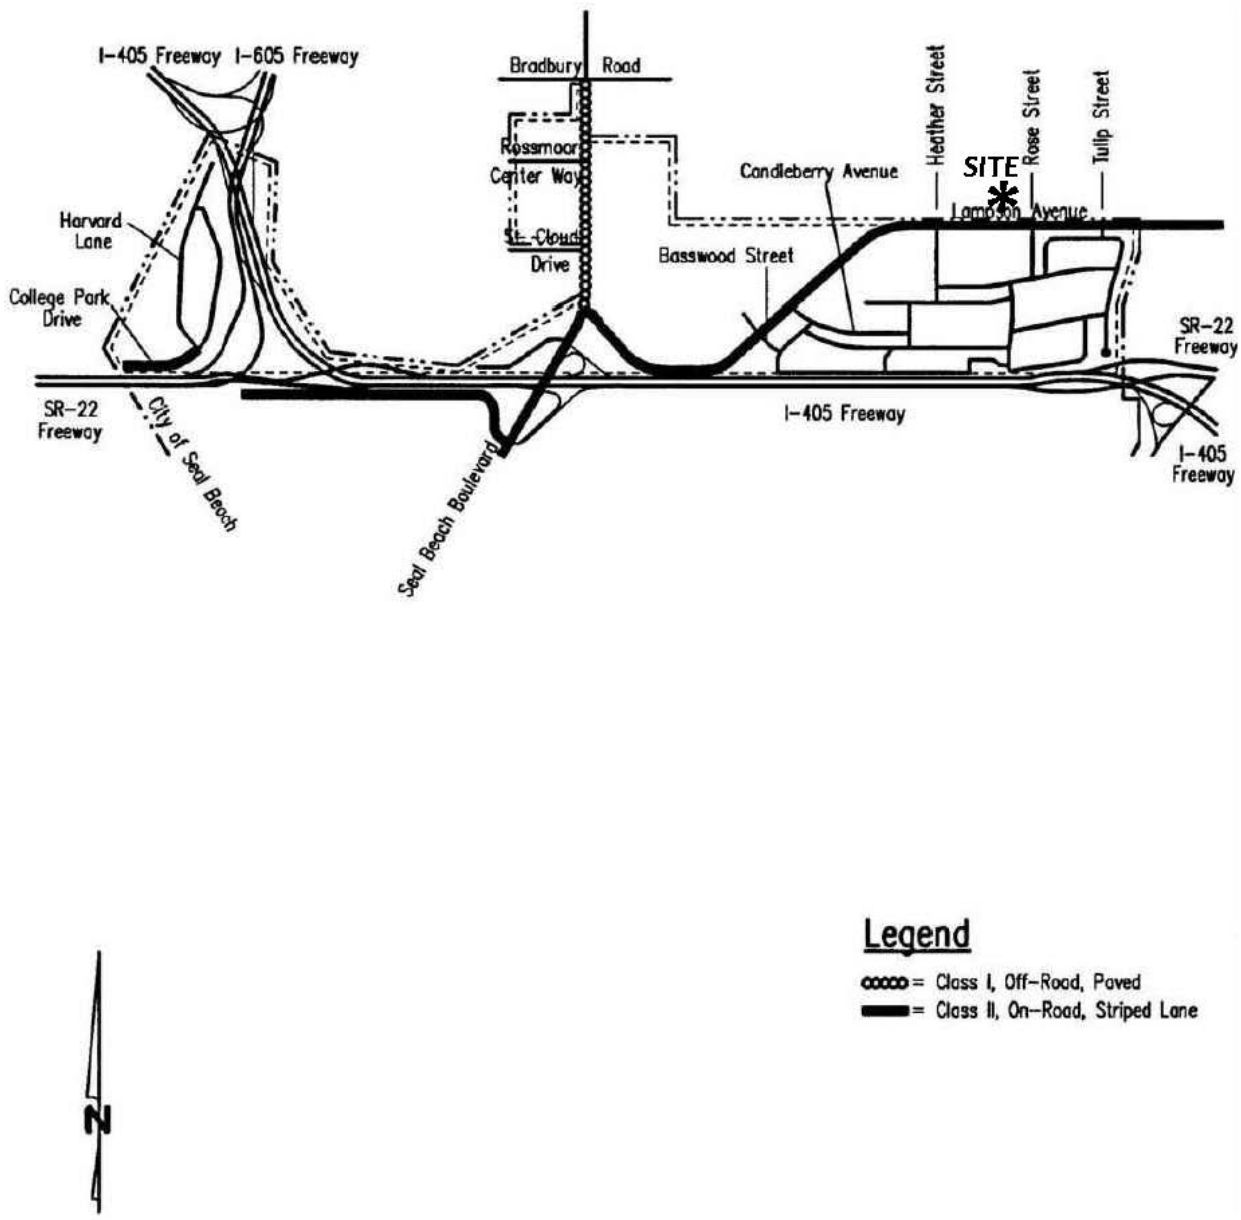

Exhibit 3-6 illustrates the existing crosswalks and existing sidewalks near the study area intersections. As shown on Exhibit 3-6, there are sidewalks provided along the frontage of the Project. The sidewalk on the north side of Lampson begins near Manley Street and continues to the east. The existing sidewalk on the south side of Lampson Avenue starts at Old Ranch Plaza and continues to the east. All signalized study area intersections accommodate at least two approaches that have crosswalks to provide connectivity to the existing sidewalks.

3.5 TRANSIT SERVICE

The study area is currently served by OCTA with bus service along Seal Beach Boulevard, Valley View Street, and Lampson Avenue (east of Valley View Street). OCTA route 42 runs along Seal Beach Boulevard and serves Seal Beach to Orange with an existing stop provided at Lampson Avenue. Bus service frequency is approximately 20-minute intervals during the peak commute hours and 40-mintus during other times of the day during a typical weekday. OCTA Route 123 serves the City of Anaheim to City of Huntington Beach via Malvern Avenue, Valley View Street, and Bolsa Chica. There are existing stops along Valley View Street with an existing stop at Chapman Avenue. Bus service frequency is approximately 60-minute intervals on a typical weekday for OCTA Route 123. The existing bus routes and stops are illustrated on Exhibit 3-7. Transit service is reviewed and updated by OCTA periodically to address ridership, budget, and community demand needs. Changes in land use can affect these periodic adjustments which may lead to either enhanced or reduced service where appropriate. Transit routes in the area should be reviewed to consider a potential route along Lampson Avenue for service between Seal Beach Boulevard and Valley View Street.

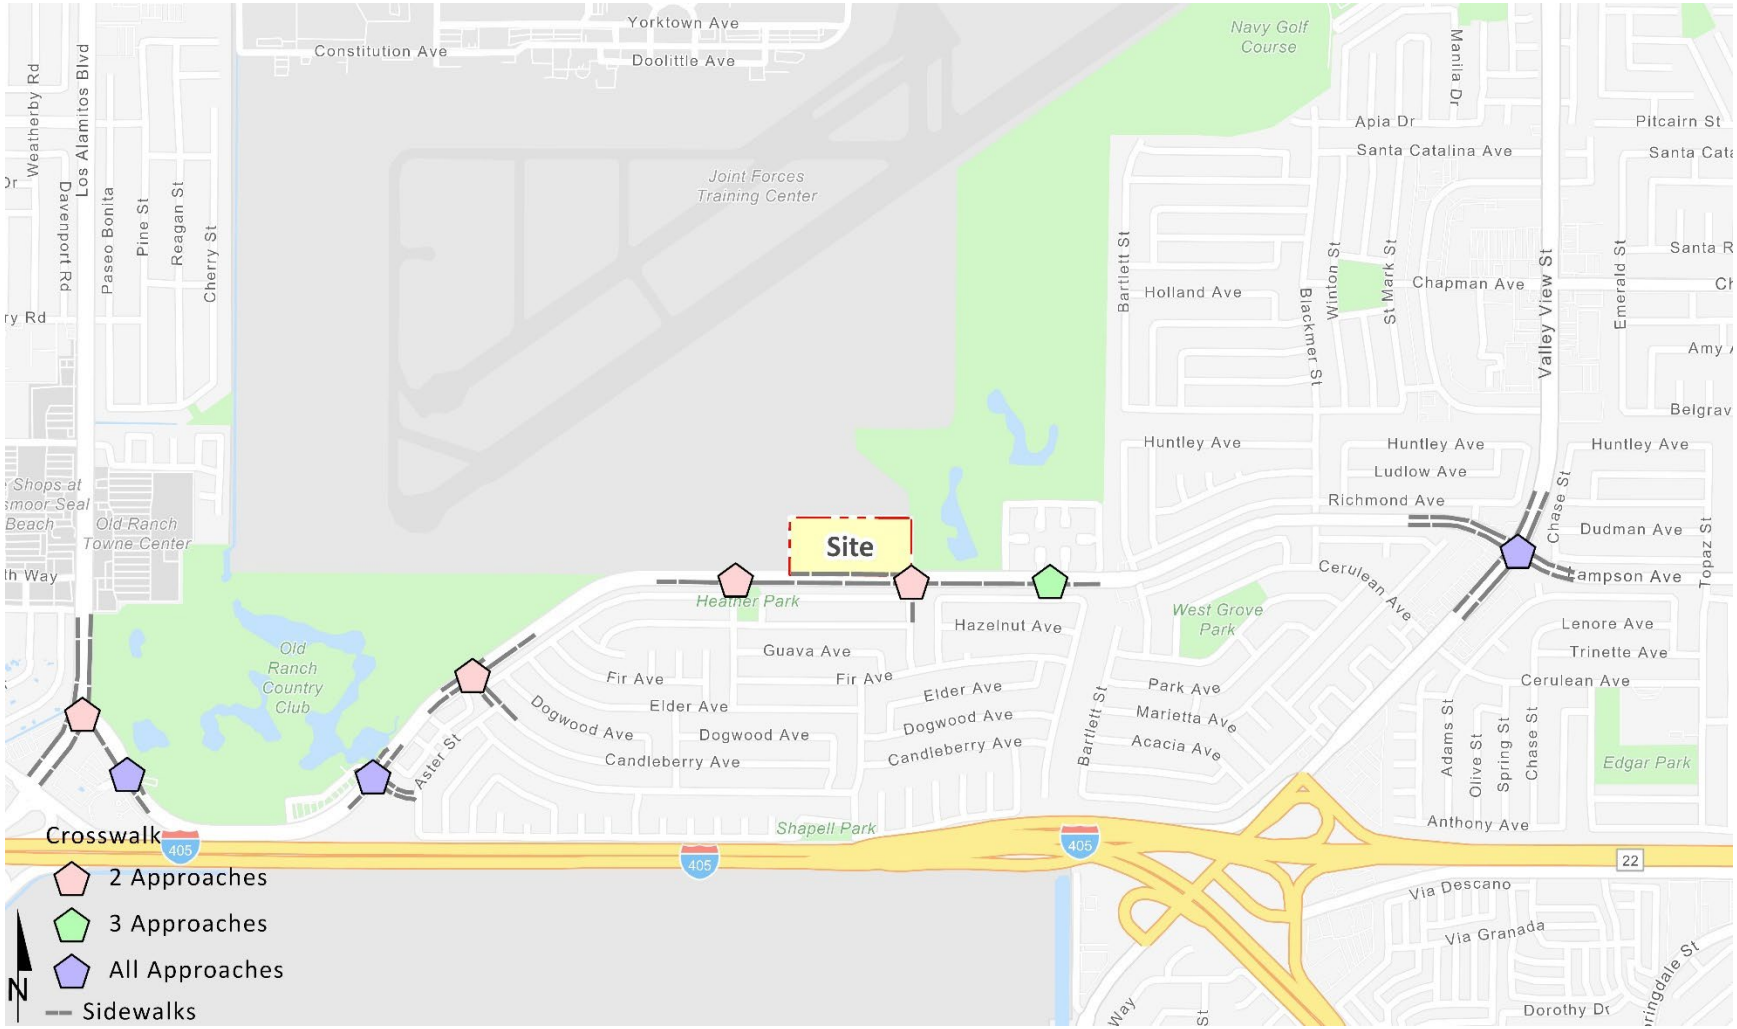
3.6 EXISTING (2022) TRAFFIC COUNTS

The intersection LOS analysis is based on the traffic volumes observed during the peak hour conditions using traffic count data collected in June and September 2022. The following peak hours were selected for analysis:

- AM Peak Period: 7:00-9:00 AM
- PM Peak Period: 4:00-6:00 PM

The 2022 weekday AM and PM peak hour count data is representative of typical weekday peak hour traffic conditions in the study area. There were no observations made in the field that would indicate atypical traffic conditions on the count dates, such as construction activity or detour routes and near-by schools were in session and operating on normal schedules. The raw manual peak hour turning movement traffic count data sheets are included in Appendix 3.1. Baseline volumes were adjusted to account for volume balancing between intersections so there is no unexplained loss of vehicles between intersections with no other access.

EXHIBIT 3-6: EXISTING PEDESTRIAN FACILITIES



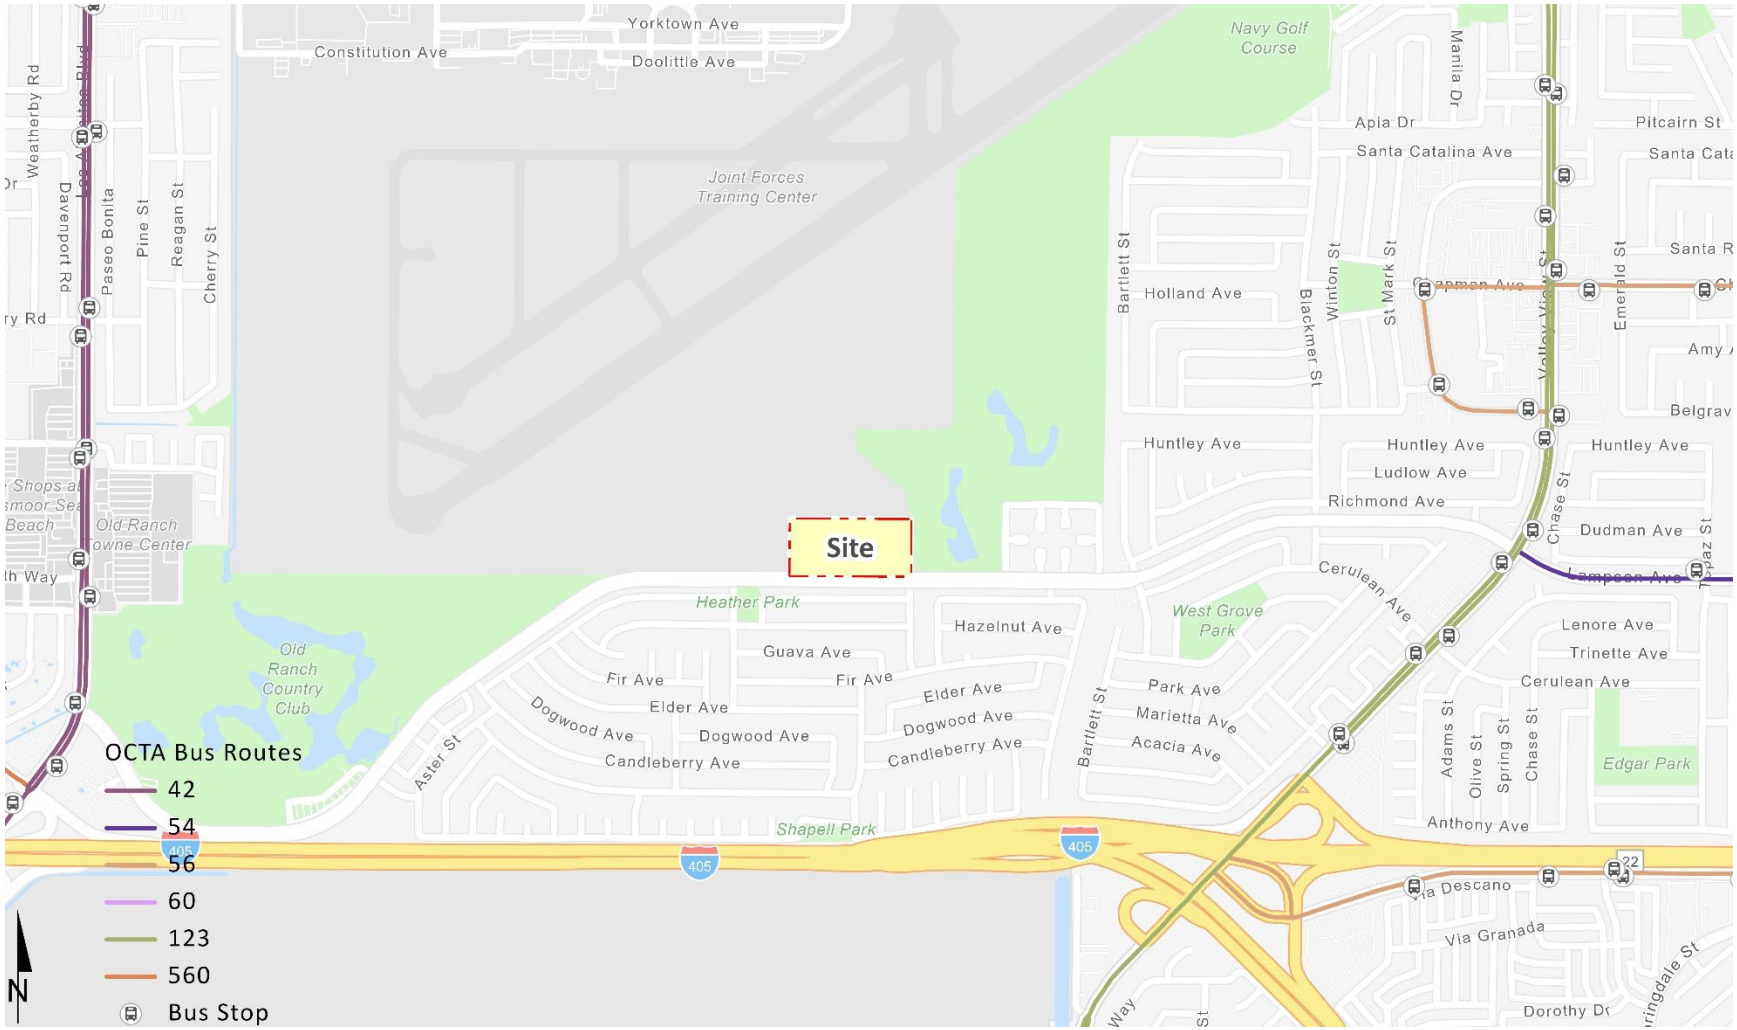


EXHIBIT 3-7: TRANSIT ROUTES

Existing weekday Average Daily Traffic (ADT) volumes are shown on Exhibit 3-8. Where actual 24-hour tube count data was not available, Existing ADT volumes were based upon factored intersection peak hour counts collected by Urban Crossroads, Inc. using the following formula for each intersection leg:

Weekday PM Peak Hour (Approach Volume + Exit Volume) x 10.64 = Leg Volume

A comparison of the PM peak hour and daily traffic volumes of various roadway segments within the study area indicated that the peak-to-daily relationship is approximately 9.40 percent. As such, the above equation utilizing a factor of 10.64 estimates the ADT volumes on the study area roadway segments assuming a peak-to-daily relationship of approximately 9.40 percent (i.e., 1/0.0940 = 10.64) and was assumed to sufficiently estimate ADT volumes for planning-level analyses. Existing weekday AM and PM peak hour intersection volumes are shown on Exhibit 3-8.

3.7 INTERSECTION OPERATIONS ANALYSIS

Existing peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2.2 Intersection Capacity Analysis of this report. The intersection operations analysis results are summarized in Table 3-1, which indicates that the study area intersections are currently operating at an acceptable LOS during the peak hours. The intersection operations analysis worksheets are included in Appendix 3.2 of this TA.

TABLE 3-1: INTERSECTION ANALYSIS FOR EXISTING (2022) CONDITIONS

#	Intersection	Traffic Control[2]	ICU (v/c)[1]		Level of Service

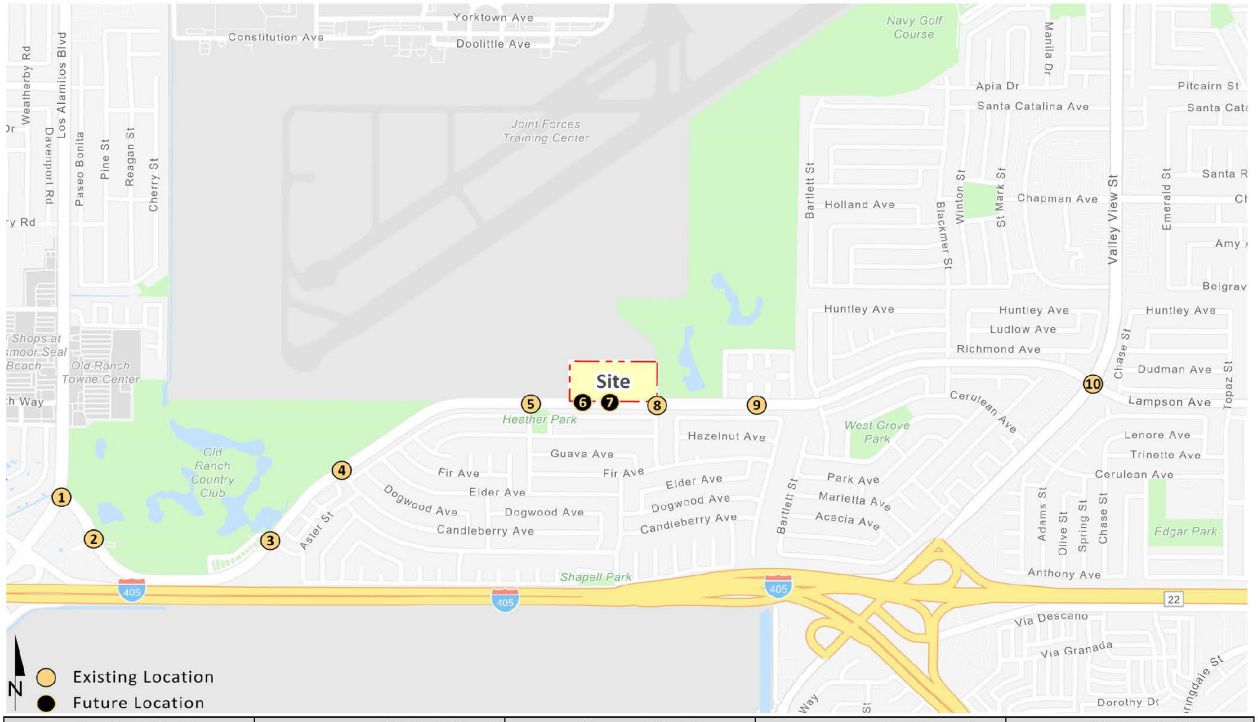
[1] ICU is reported in volume-to-capacity (v/c). ICU analysis conducted for signalized intersections only.



[2] TS = Traffic Signal

There are existing westbound U-turns occurring at the intersection of Heather Street and Lampson Avenue, however, the intersection operates at an acceptable LOS with the inclusion of these peak hour U-turns as shown in Table 3-1.

3.8 TRAFFIC SIGNAL WARRANTS ANALYSIS

All of the existing study area intersections are currently signalized. As such, no traffic signal warrant analysis has been conducted for Existing (2022) traffic conditions.

3.9 ROADWAY SEGMENT ANALYSIS

Table 3-2 provides a summary of the Existing (2022) conditions roadway segment capacity analysis. As shown in Table 3-2, the study area roadway segments are currently operating at an unacceptable LOS based on the daily roadway capacity thresholds and minimum LOS criteria.

TABLE 3-2: ROADWAY SEGMENT ANALYSIS FOR EXISTING (2022) CONDITIONS

#	Roadway	Segment Limits	Roadway Section	LOS Capacity[1]	Existing 2022	Existing V/C[2]	Existing LOS[3]
1	Seal Beach Bl.	South of Lampson Av.	6D	56,300	36,668	0.651	B
2	Lampson Av.	Seal Beach Bl. to Old Ranch Plaza	4D	37,500	17,399	0.464	A
3	Lampson Av.	Old Ranch Plaza to Basswood St.	4D	37,500	16,668	0.444	A
4	Lampson Av.	Basswood St. to Candleberry Av.	4D	37,500	13,134	0.350	A
5	Lampson Av.	Candleberry Av. to Heather St.	4D	37,500	11,474	0.306	A
6	Lampson Av.	Heather St. to Rose St.	4D	37,500	11,644	0.311	A
7	Lampson Av.	Rose St. to Tulip St.	4D	37,500	12,059	0.322	A
8	Lampson Av.	Tulip St. to Valley View St.	4D	37,500	13,007	0.347	A
9	Lampson Av.	East of Valley View St.	4D	37,500	10,186	0.272	A

[1] These maximum roadway capacities are based on the City of Seal Beach's General Plan Roadway Segment Thresholds.

[2] V/C = Volume to Capacity Ratio

[3] LOS = Level of Service

4 PROJECTED FUTURE TRAFFIC

The Project consists of the development of 55 single family detached residential dwelling units (cluster homes), 114 multifamily (low-rise) residential dwelling units, and 77 affordable apartment dwelling units (total of 246 dwelling units). Access to the Project site will be accommodated to Lampson Avenue via two proposed driveways. The site is currently occupied by the California Department of Fish and Wildlife building and parking lot; however, no credit has been taken for the existing use for the purposes of this traffic study in an effort to conduct a conservative analysis.

4.1 PROJECT TRIP GENERATION

Trip generation represents the amount of traffic which is both attracted to and produced by a development. Determining traffic generation for a specific project is therefore based upon forecasting the amount of traffic that is expected to be both attracted to and produced by the specific land uses being proposed for a given development.

4.1.1 PROPOSED PROJECT

In order to develop the traffic characteristics of the proposed Project, trip-generation statistics published in the ITE Trip Generation Manual (11th Edition, 2021) for the Single Family Detached Residential Land Use category (ITE Land Use Code 210), Multifamily (Low-Rise) Housing (ITE Land Use Code 220), and Affordable Housing (ITE Land Use Code 223) were used to calculate the Project trip generation (see Table 4-1 for rates). The trip generation summary illustrating daily, and peak hour trip generation estimates for the proposed Project are also shown on Table 4-1. The proposed Project is anticipated to generate 1,658 two-way trip-ends per day with 112 AM peak hour trips and 147 PM peak hour trips.

TABLE 4-1: PROJECT TRIP GENERATION SUMMARY

		ITE LU	AM Peak Hour			PM Peak Hour			
Land Use[1]	Units[2]	Code	In	Out	Total	In	Out	Total	Daily

[1] DU = Dwelling Units

4.1.2 PROJECT ALTERNATIVE

The proposed Project is considering an alternative that replaces the affordable housing with age-restricted housing (attached product type). The trip generation rates for the Project including the alternative attached senior housing (see Table 4-2 for rates). The trip generation summary illustrating daily, and peak hour trip generation estimates for the Project Alternative are also shown on Table 4-2. The Project Alternative is anticipated to generate 1,538 two-way trip-ends per day with 99 AM peak hour trips and 130 PM peak hour trips. As shown, the Project Alternative generates 120 fewer two-way trip-ends per day with 13 fewer AM peak hour trips and 17 fewer PM peak hour trips.

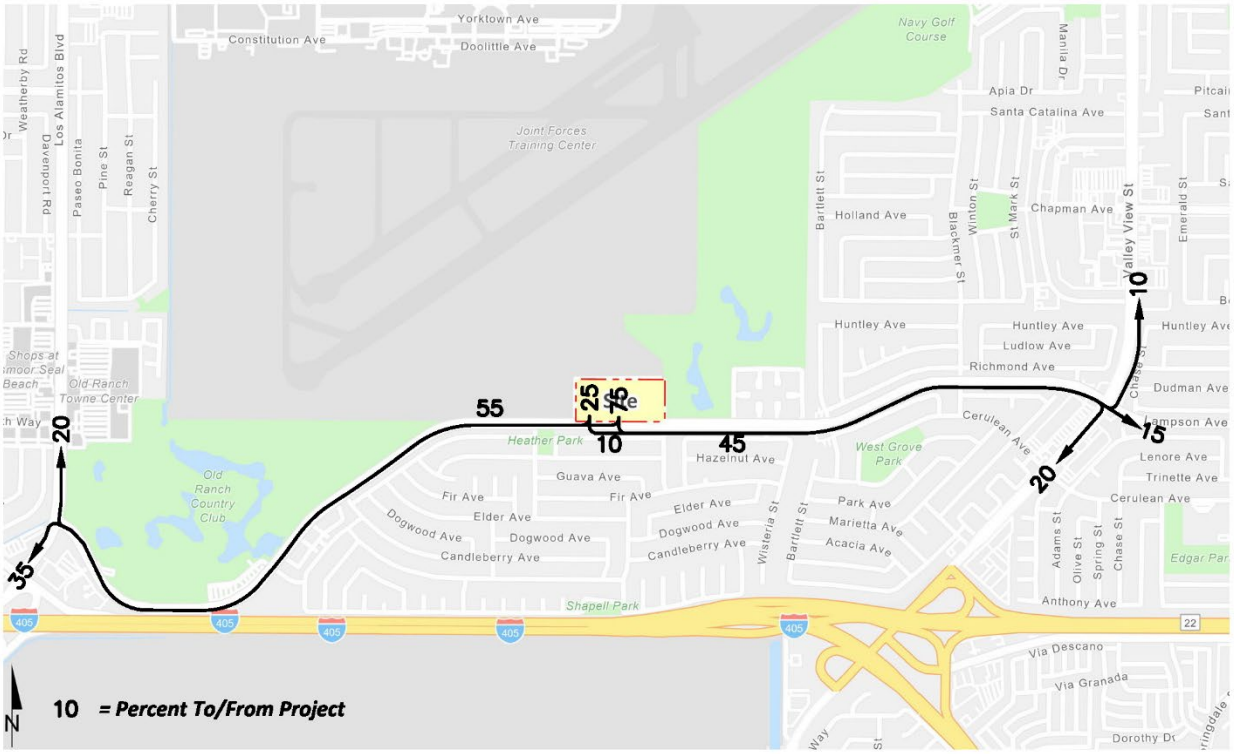
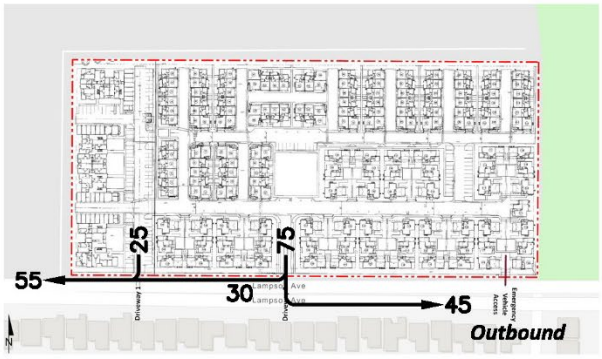
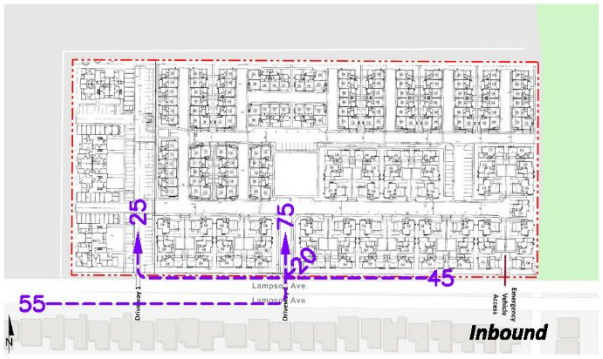
[1] DU = Dwelling Units



4.2 PROJECT TRIP DISTRIBUTION



The Project trip distribution represents the directional orientation of traffic to and from the Project site. Trip distribution is the process of identifying the probable destinations, directions or traffic routes that will be utilized by Project traffic. The potential interaction between the planned land uses and surrounding regional access routes are considered, to identify the route where the Project traffic would distribute. Exhibit 4-1 shows the Project trip distribution patterns which was reviewed as part of the traffic study scoping process (see Appendix 1.1). Project traffic is not anticipated to utilize Heather Street for U-turns along Lampson Avenue as the multifamily component would have access to the full access driveway (Driveway 2) on Lampson Avenue for making southbound left turns.



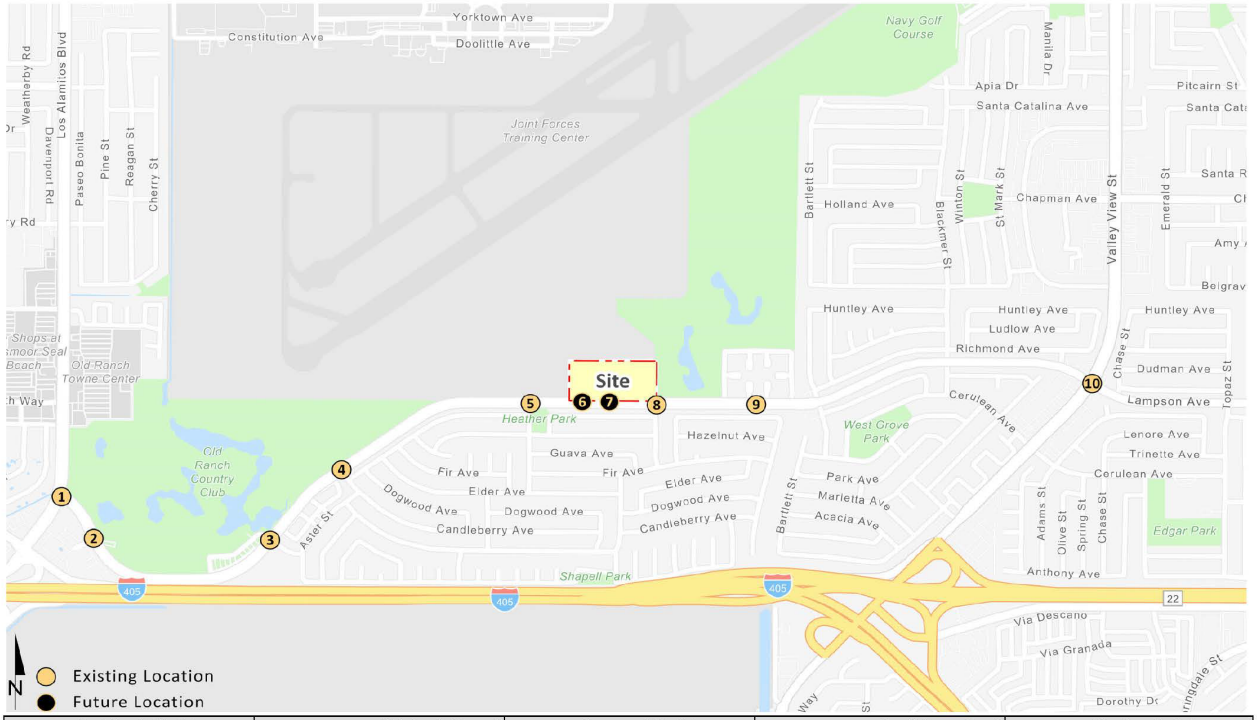
4.3 MODAL SPLIT

The potential for Project trips to be reduced by the use of public transit, walking or bicycling have not been included as part of the Project's estimated trip generation. Essentially, the Project's traffic projections are "conservative" in that these alternative travel modes would reduce the forecasted traffic volumes.

EXHIBIT 4-1: PROJECT TRIP DISTRIBUTION

4.4 PROJECT TRIP ASSIGNMENT

The assignment of traffic from the Project area to the adjoining roadway system is based upon the Project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the Project. Based on the identified Project traffic generation and trip distribution patterns, Project only ADT and weekday AM and PM peak hour intersection turning movement volumes are shown on Exhibit 4-2.



4.5 BACKGROUND TRAFFIC

Future year traffic forecasts have been based upon background (ambient) growth at 2.0% per year for 2026 traffic conditions. The ambient growth factor is intended to approximate regional traffic growth. The total ambient growth is 8.24% for 2026 traffic conditions (growth of 2.0 percent per year over 4 years). This ambient growth rate is added to existing traffic volumes to account for area-wide growth not reflected by cumulative development projects. Ambient growth has been added to daily and peak hour traffic volumes on surrounding roadways, in addition to traffic generated by the development of future projects that have been approved but not yet built and/or for which development applications have been filed and are under consideration by governing agencies. Opening Year Cumulative (2026) traffic volumes are provided in Section 6 of this report.

4.6 CUMULATIVE DEVELOPMENT TRAFFIC

A cumulative project list was developed for the purposes of this analysis through consultation with planning staff from the City of Los Alamitos, City of Seal Beach, and City of Garden Grove. The cumulative projects listed are those that would generate traffic and would contribute traffic to study area intersections. Exhibit 4-3 illustrates the cumulative development location map. A summary of cumulative development projects and their proposed land uses are shown in Table 4-3. In an effort to conduct a conservative analysis, the cumulative projects are added in conjunction with the ambient growth identified in Section 4.5 Background Traffic. The Cumulative ADT and weekday AM and PM peak hour intersection turning movement volumes for all cumulative development projects are shown on Exhibit 4-4.

4.7 VOLUME DEVELOPMENT FOR GENERAL PLAN BUILDOUT CONDITIONS

Traffic projections for General Plan Buildout Without Project and With Project conditions were derived from the OCTAM Version 5.5 maintained by the OCTA. Based on the city-wide land use data and the regional socioeconomic growth projections, future trip activity is estimated and assigned to the roadway circulation system. Model output is post-processed based on established postprocessing methodologies. The post-processor applies the model's projected growth to each turning movement for both General Plan Buildout Without and With Project scenarios, forecasting a value that reflects future growth.

The traffic forecasts reflect the area-wide growth anticipated between Existing (2022) conditions and General Plan Buildout traffic conditions. In most instances the traffic model zone structure is not designed to provide accurate turning movements along arterial roadways unless refinement and reasonableness checking is performed. Therefore, the General Plan Buildout peak hour forecasts were refined using the model derived long range forecasts, base (validation) year model forecasts, along with existing peak hour traffic count data collected at each analysis location in June/September 2022. The OCTAM has a base (validation) year of 2016 and a horizon (future forecast) year of 2045. The difference in model volumes (2045-2016) defines the growth in traffic over the 29-year period.

The refined future peak hour approach and departure volumes obtained from the model output data are then entered into a spreadsheet program consistent with the National Cooperative Highway Research Program (NCHRP Report 765), along with initial estimates of turning movement proportions. A linear programming algorithm is used to calculate individual turning movements which match the known directional roadway segment forecast volumes computed in the previous step. This program computes a likely set of intersection turning movements from intersection approach counts and the initial turning proportions from each approach leg.

The OCTAM uses an AM peak period-to-peak hour factor of 0.36 and a PM peak period-to-peak hour factor of 0.266. These factors represent the relationship of the highest single AM peak hour to the modeled 3-hour AM peak period (an even distribution would result in a factor of 0.33) and the highest single PM peak hour to the modeled 4-hour PM peak period (an even distribution would result in a factor of 0.25). Typically, the model growth is prorated and is subsequently added to the existing (base validation) traffic volumes to represent General Plan Buildout traffic conditions. In an effort to conduct a conservative analysis, reductions to traffic forecasts from either Existing traffic conditions were not assumed as part of this analysis. Future estimated peak hour traffic data was used for new intersections and intersections with an anticipated change in travel patterns to further refine the General Plan Buildout peak hour forecasts.

The future General Plan Buildout Without Project and With Project peak hour turning movements were then reviewed by Urban Crossroads, Inc. for reasonableness, and in some cases, were adjusted to achieve flow conservation, reasonable growth, and reasonable diversion between parallel routes. Flow conservation checks ensure that traffic flow between two closely spaced intersections, such as two adjacent driveway locations, is verified in order to make certain that vehicles leaving one intersection are entering the adjacent intersection and that there is no unexplained loss of vehicles. The result of this traffic forecasting procedure is a series of traffic volumes which are suitable for traffic operations analysis. Post processing has been performed for the weekday AM and PM peak hours only as these are the only time periods where traffic model data was readily available. The post processed volumes for General Plan Buildout Without Project traffic conditions are provided in Appendix 4.1.

Only the intersections of Seal Beach Boulevard at Lampson Avenue and Valley View Street at Lampson Avenue are modeled in OCTAM. All other study area intersections are not reflected in the traffic model. As such, the traffic volumes at all remaining study intersections have been calculated by applying an ambient growth factor from Existing (2022) conditions of 14% in conjunction with the traffic generated by other known or probable related projects. The total growth between existing and General Plan Buildout conditions has been determined by calculating the average growth observed at the two modeled intersections.

5 OPENING YEAR CUMULATIVE (2026) TRAFFIC CONDITIONS

This section discusses the traffic forecasts for Opening Year Cumulative (2026) conditions and the resulting intersection operations and traffic signal warrant analyses.

5.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for Opening Year Cumulative conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for Opening Year Cumulative conditions (e.g., intersection and roadway improvements at the Project's frontage and driveways).
- Driveways and those facilities assumed to be constructed by cumulative developments to provide site access are also assumed to be in place for Opening Year Cumulative conditions (e.g., intersection and roadway improvements along the cumulative development's frontages and driveways).

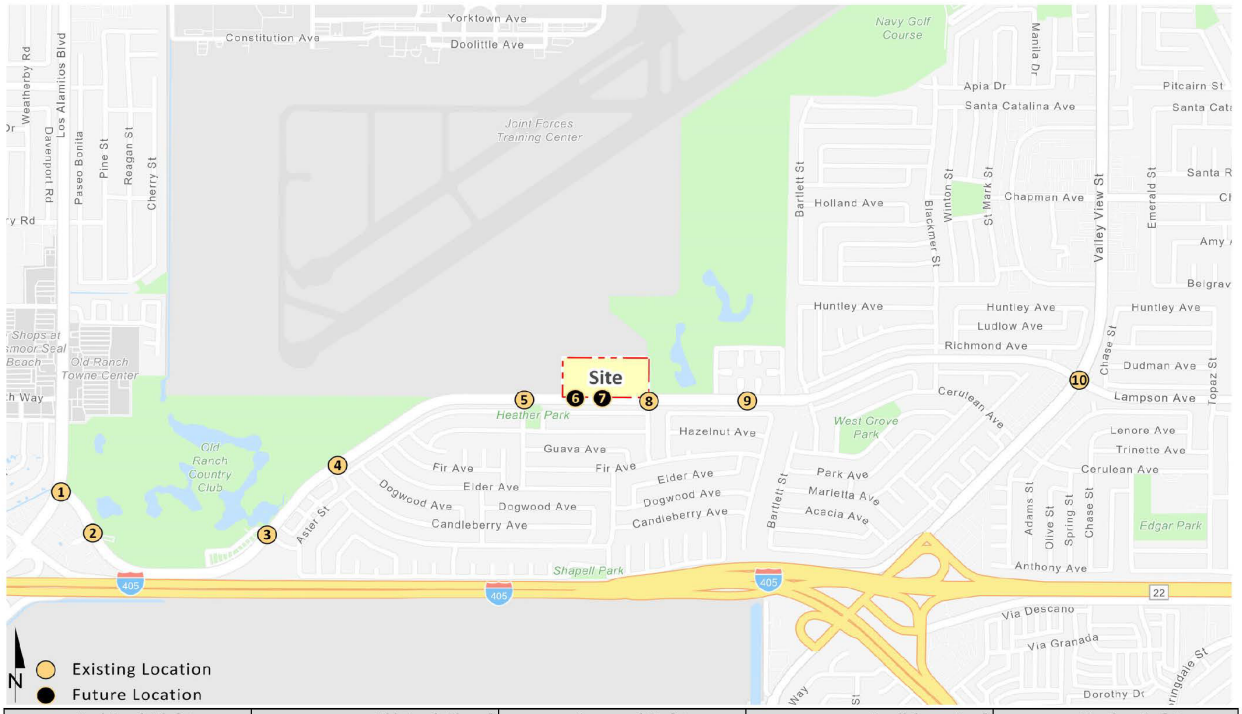
5.2 WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes Existing traffic volumes plus an ambient growth factor of 8.24% plus traffic from pending and approved but not yet constructed known development projects in the area. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Opening Year Cumulative (2026) Without Project traffic conditions are shown on Exhibit 5-1.

5.3 WITH PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes Opening Year Cumulative (2026) Without Project volumes plus Project traffic. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Opening Year Cumulative (2026) With Project traffic conditions are shown on Exhibit 5-2.

5.4 INTERSECTION OPERATIONS ANALYSIS



Opening Year Cumulative peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 Methodologies of this TA. The intersection analysis results are summarized in Table 5-1 for Opening Year Cumulative traffic conditions, which indicates that the study area intersections are anticipated to continue to operate at an acceptable LOS during the peak hours under Opening Year Cumulative (2026) Without Project traffic conditions.

The following study area intersection is anticipated to operate at an unacceptable LOS during the peak hours with the addition of Project traffic:

- Seal Beach Bl. & Lampson Av. (#1) – LOS E PM peak hour only

The addition of Project traffic is also anticipated to increase the v/c ratio by more than 0.01 at the intersection of Seal Beach Boulevard and Lampson Avenue. As such, improvements are provided for the deficient intersection. The intersection operations analysis worksheets for Opening Year Cumulative (2026) Without and With Project traffic conditions are included in Appendix 5.1 and Appendix 5.2 of this TA, respectively.

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

ICU is reported in volume-to-capacity (v/c). ICU analysis conducted for signalized intersections only.

[2] CSS = Cross-street Stop; TS = Traffic Signal; **CSS** = Improvement

5.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

All existing study area intersections are currently signalized. As such, no traffic signal warrant analysis has been conducted for Opening Year Cumulative (2026) Without Project traffic conditions. The intersection of Driveway 2 at Lampson Avenue is not anticipated to warrant a peak hour or planning-level (ADT) based warrant under Opening Year Cumulative (2026) With Project traffic conditions. The traffic signal warrant analysis worksheets for Opening Year Cumulative (2026) With Project traffic conditions are included in Appendix 5.3 of this TA.

5.6 ROADWAY SEGMENT ANALYSIS

Table 5-2 provides a summary of the Opening Year Cumulative (2026) conditions roadway segment capacity analysis. As shown in Table 5-2, the study area roadway segments are anticipated to continue to operate at an acceptable LOS based on the daily roadway capacity thresholds and minimum LOS criteria under Opening Year Cumulative (2026) Without and With Project traffic conditions.

TABLE 5-2: ROADWAY SEGMENT ANALYSIS FOR OPENING YEAR CUMULATIVE (2026) CONDITIONS

#	Roadway	Segment Limits	Roadway Section	LOS Capacity[1]	Without Project 2026	Without Project V/C[2]	Without Project LOS[3]	With Project 2026	With Project V/C[2]	With Project LOS[3]

3	Lampson Av.	Old Ranch Plaza to Basswood St.	4D	37,500	19,048	0.51	A	19,960	0.53	A
4	Lampson Av.	Basswood St. to Candleberry Av.	4D	37,500	15,223	0.41	A	16,135	0.43	A
5	Lampson Av.	Candleberry Av. to Heather St.	4D	37,500	13,506	0.36	A	14,418	0.38	A
6	Lampson Av.	Heather St. to Rose St.	4D	37,500	13,770	0.37	A	14,682	0.39	A
7	Lampson Av.	Rose St. to Tulip St.	4D	37,500	14,299	0.38	A	15,045	0.40	A
8	Lampson Av.	Tulip St. to Valley View St.	4D	37,500	15,437	0.41	A	16,183	0.43	A
9	Lampson Av.	East of Valley View St.	4D	37,500	11,416	0.30	A	11,664	0.31	A

[1] These maximum roadway capacities are based on the City of Seal Beach's General Plan Roadway Segment Thresholds.

[2] V/C = Volume to Capacity Ratio

[3] LOS = Level of Service

5.7 DEFICIENCIES AND RECOMMENDED IMPROVEMENTS

This section provides a summary of deficiencies and recommended improvements for Opening Year Cumulative (2026) traffic conditions. Based on deficiency criteria discussed in Section 2.5 *Deficiency Criteria*, the following intersection was found to be deficient. Improvements necessary to improve the traffic deficiency back to acceptable levels are discussed below.

Seal Beach Boulevard & Lampson Avenue (#1): The intersection of Seal Beach Boulevard and Lampson Avenue is anticipated to meet the applicable deficiency criteria for LOS. As shown in Table 5-3, restriping the number two westbound left turn lane as a shared left-right turn lane would improve the intersection operations back to acceptable LOS.

The intersection operations analysis worksheets for Opening Year Cumulative (2026) With Project traffic conditions, with improvements, are included in Appendix 5.4 of this TA.

TABLE 5-3: INTERSECTION ANALYSIS FOR OPENING YEAR CUMULATIVE (2026) CONDITIONS WITH IMPROVEMENTS

			Intersection Approach Lanes[1]														Level of Service	
		Traffic	Northbound			Southbound			Eastbound			Westbound			ICU (v/c)[2]			
#	Intersection	Control[3]	L	T	R	L	T	R	L	T	R	L	T	R	AM	PM	AM	PM
1	Seal Beach Bl. & Lampson Av.																	
	- Without Improvements	TS	0	3	1>	2	3	0	0	0	0	2	0	1>	0.88	**0.91**	D	**E**
	- With Improvements[4]	TS	0	3	1>	2	3	0	0	0	0	**1**	**1**	1>	0.71	0.78	C	C

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; **1** = Improvement

[2] ICU is reported in volume-to-capacity (v/c). ICU analysis conducted for signalized intersections only.

[3] TS = Traffic Signal

[4] Improvement includes restriping the number 2 westbound left as a shared left-right turn lane.

6 GENERAL PLAN BUILDOUT TRAFFIC CONDITIONS

This section discusses the traffic forecasts for General Plan Buildout conditions and the resulting intersection operations and traffic signal warrant analyses.

6.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for General Plan Buildout conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

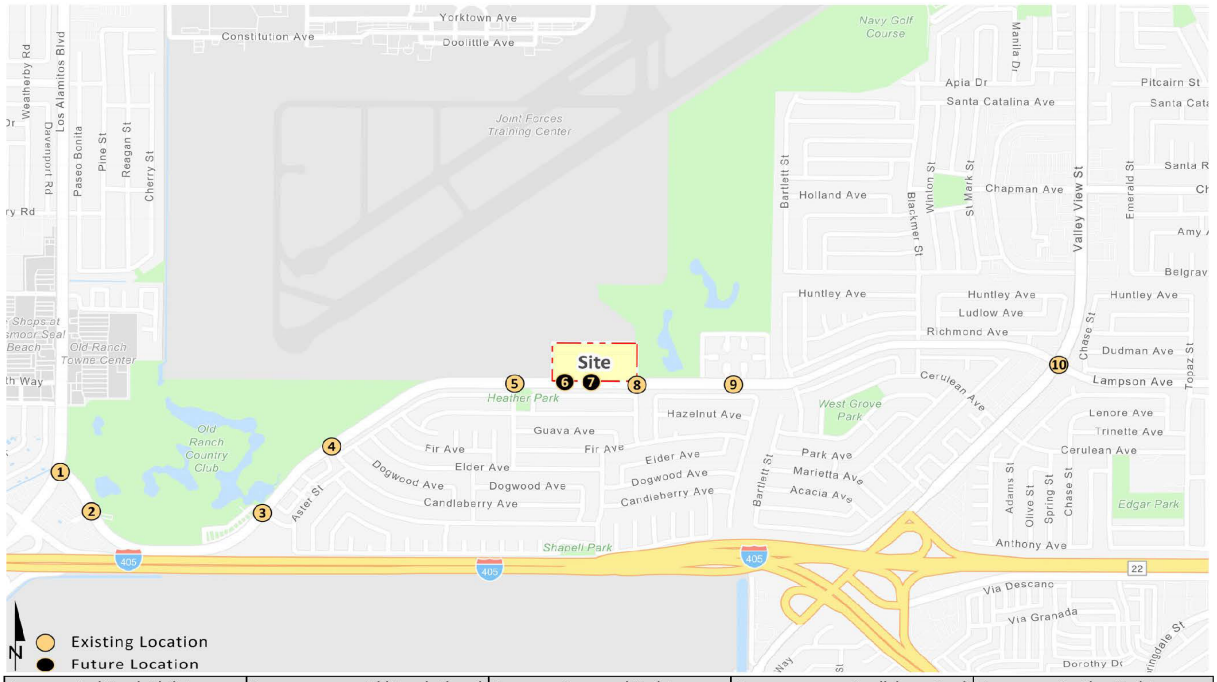
- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for General Plan Buildout conditions (e.g., intersection and roadway improvements at the Project's frontage and driveways).
- Driveways and those facilities assumed to be constructed by cumulative developments to provide site access are also assumed to be in place for General Plan Buildout conditions (e.g., intersection and roadway improvements along the cumulative development's frontages and driveways).

6.2 WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

For the intersections of Seal Beach Boulevard at Lampson Avenue and Valley View Steet at Lampson Avenue the General Plan Buildout Without Project weekday AM and PM peak hour volumes are based on the OCTAM traffic model. For the remaining study intersections, the scenario includes Existing traffic volumes plus an ambient growth factor of 14% plus traffic from pending and approved but not yet constructed known development projects in the area (see Section 4.7 for additional discussion on volume development). The weekday ADT and weekday AM and PM peak hour volumes which can be expected for General Plan Buildout Without Project traffic conditions are shown on Exhibit 6-1.

6.3 WITH PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes General Plan Buildout Without Project volumes plus Project traffic. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for General Plan Buildout With Project traffic conditions are shown on Exhibit 6-2.



6.4 INTERSECTION OPERATIONS ANALYSIS

General Plan Buildout peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 Methodologies of this TA. The intersection analysis results are summarized in Table 6-1 for General Plan Buildout traffic conditions, which indicates that the following study area intersection is anticipated to continue to operate at an unacceptable LOS during the peak hours under General Plan Buildout Without Project traffic conditions:

- Seal Beach Bl. & Lampson Av. (#1) – LOS F AM and PM peak hours

There are no additional study area intersections anticipated to operate at an unacceptable LOS during the peak hours with the addition of Project traffic, in addition to the locations identified for General Plan Buildout Without Project traffic conditions. However, the addition of Project traffic is anticipated to increase the v/c ratio by more than 0.01 at the intersection of Seal Beach Boulevard and Lampson Avenue. As such, improvements are provided for the deficient intersections.

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

ICU is reported in volume-to-capacity (v/c). ICU analysis conducted for signalized intersections only.

[2] CSS = Cross-street Stop; TS = Traffic Signal; **CSS** = Improvement

The intersection operations analysis worksheets for General Plan Buildout Without and With Project traffic conditions are included in Appendix 6.1 and Appendix 6.2 of this TA, respectively. The intersection of Driveway 2 and Lampson Avenue is anticipated to operate at an acceptable LOS as a cross-street stop. As such, no traffic signal is recommended at Driveway 2 and Lampson Avenue.

6.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

All existing study area intersections are currently signalized. As such, no traffic signal warrant analysis has been conducted for General Plan Buildout Without Project traffic conditions. The intersection of Driveway 2 at Lampson Avenue is not anticipated to warrant a peak hour or planning-level (ADT) based warrant under General Plan Buildout With Project traffic conditions. The traffic signal warrant analysis worksheets for General Plan Buildout With Project traffic conditions are included in Appendix 6.3 of this TA.

6.6 ROADWAY SEGMENT ANALYSIS

Table 6-2 provides a summary of the General Plan Buildout conditions roadway segment capacity analysis. As shown in Table 6-2, the study area roadway segments are anticipated to continue to operate at an acceptable LOS based on the daily roadway capacity thresholds and minimum LOS criteria under General Plan Buildout Without and With Project traffic conditions.

6.7 DEFICIENCIES AND RECOMMENDED IMPROVEMENTS

This section provides a summary of deficiencies and recommended improvements for General Plan Buildout traffic conditions. Based on deficiency criteria discussed in Section 2.5 *Deficiency Criteria*, the following intersection was found to be deficient. Improvements necessary to improve this traffic deficiency back to acceptable levels are discussed below.

Seal Beach Boulevard & Lampson Avenue (#1): the same improvements as those identified previously for Opening Year Cumulative traffic conditions would improve the intersection operations back to acceptable LOS (see Table 6-3).

The intersection operations analysis worksheets for General Plan Buildout With Project traffic conditions, with improvements, are included in Appendix 6.4 of this TA.

TABLE 6-2: ROADWAY SEGMENT ANALYSIS FOR GENERAL PLAN BUILDOUT CONDITIONS

[1] These maximum roadway capacities are based on the City of Seal Beach's General Plan Roadway Segment Thresholds.

[2] V/C = Volume to Capacity Ratio

[3] LOS = Level of Service

TABLE 6-3: INTERSECTION ANALYSIS FOR GENERAL PLAN BUILDOUT CONDITIONS WITH IMPROVEMENTS

#	Intersection	Traffic Control[3]	Intersection Approach Lanes[1] Northbound L	T	R	Southbound L	T	R	Eastbound L	T	R	Westbound L	T	R	ICU (v/c)[2] AM	PM	Level of Service AM	PM
1	Seal Beach Bl. & Lampson Av.																	
	- Without Improvements	TS	0	3	1>	2	3	0	0	0	0	2	0	1>	**1.03**	**1.02**	**F**	**F**
	- With Improvements[4]	TS	0	3	1>	2	3	0	0	0	0	**1**	**1**	1>	0.83	0.87	D	D

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; **1** = Improvement

[2] ICU is reported in volume-to-capacity (v/c). ICU analysis conducted for signalized intersections only.

[3] TS = Traffic Signal

[4] Improvement includes restriping the number 2 westbound left as a shared left-right turn lane.

The peak hour queues have been assessed with the proposed improvements shown at Seal Beach Boulevard at Lampson Avenue and also at the intersection of Valley View Street with Lampson Avenue. Table 6-4 indicates there are no peak hour queuing issues with the recommendations at Seal Beach Boulevard and Lampson Avenue. Although there are queuing issues identified for the intersection of Valley View Street at Lamson Avenue, the same queuing issues are anticipated for both Without and With the Project. It should also be noted that the addition of Project traffic would not add more than one vehicle length (approximately 25-feet) to any of the turning movements with queuing issues identified. The queuing analysis worksheets for General Plan Buildout Without and With Project traffic conditions are included in Appendixes 6.5 and 6.6, respectively.

TABLE 6-4: PEAK HOUR INTERSECTION QUEUING ANALYSIS FOR GENERAL PLAN BUILDOUT CONDITIONS

* NB = Northbound, SB = Southbound, EB = Eastbound, WB = Westbound, L = Left, T = Through, R = Right

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 25 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

7 FAIR SHARE CALCULATIONS

Transportation improvements are funded through a combination of improvements constructed by the Project or fair share contributions. When off-site improvements are identified with a minor share of responsibility assigned to proposed development, the approving jurisdiction may elect to collect a fair share contribution or require the development to construct improvements. Detailed fair share calculations, for each peak hour, have been provided in Table 7-1 for the applicable deficient study area intersections. Fair share contributions are collected with the proceeds solely used as part of a funding mechanism aimed at ensuring that regional highways and arterial expansions keep pace with the projected population increases.

TABLE 7-1: PROJECT FAIR SHARE CALCULATIONS

#	Intersection		Existing 2022	Project Only	GPBO With Project	Total New Traffic	Project % of New Traffic
1	Seal Beach Bl. & Lampson Av.						
		AM:	3,985	55	5,438	1,453	3.8%
		PM:	4,339	71	5,737	1,398	**5.1%**

BOLD = Highest fair share percentage is highlighted.

MEMORANDUM

URBAN CROSSROADS

DATE: September 5, 2024
TO: Nicole Morse, T&B Planning
FROM: Jose Alire/Taryn Ferguson, Urban Crossroads
JOB NO: 14501D-07 Safety Eval

4665 LAMPSON AVENUE SAFETY EVALUATION

The firm of Urban Crossroads, Inc. is pleased to submit the following Safety Evaluation for the 4665 Lampson Avenue development (**Project**), which is located in the City of Los Alamitos. The purpose of this evaluation is to determine if the Project creates any new safety issues along the public roadways or adjacent to the Project access points.

PROPOSED PROJECT

The Project consists of the development of 55 single family detached residential dwelling units (cluster homes), 114 multifamily (low-rise) residential dwelling units, and 77 affordable apartment dwelling units (total of 246 dwelling units). A preliminary site plan for the proposed Project is shown on Exhibit 1. The Project is anticipated to have an Opening Year of 2026. Access to the Project site will be accommodated to Lampson Avenue via two proposed driveways. Driveway 1 at Lampson Avenue is currently proposed with stop control for egress traffic and right-in/right out access only. A median will be constructed to restrict access at Driveway 1. Access to Driveway 2 will allow for full access. Driveway 2 does not meet peak hour or planning level (daily volume) based traffic signal warrant under any of the analysis scenarios. Although the proposed Project is located in the City of Los Alamitos, access to the site is via intersections controlled by the City of Seal Beach.

EXHIBIT 1: PRELIMINARY SITE PLAN

SAFETY EVALUATION METHODOLOGY

The safety evaluation completed for this project included the following elements:

- Review of available collision data
- Review of potential increase presence of pedestrians and bicyclist
- Review of any proposed changes to the walking and bicycling environment and experience
- New pedestrian and bicyclist connection desires
- Multimodal conflict points, especially at intersections and project access locations
- Change in traffic mix such as an increase in bicyclists or pedestrians where features such as shoulders or sidewalks may not exist or are inconsistent with facility design (sidewalks, bike and multi-user paths, multimodal roadways, etc.)
- Increased traffic volumes
- Site access management (i.e., driveway sight distance, driveway or intersection spacing, project access queuing, multimodal conflict points, incomplete pedestrian, and bicycle connections)

COLLISION DATA

The collision data analysis is based on the collision data received from California Highway Patrols' (CHP) Statewide Integrated Traffic Records System (SWITRS). The collision data includes 5 years of collision data gathered by CHP staff and members of its Allied Agencies throughout California (including the City of Los Alamitos). The SWITRS data is provided in Attachment A. Table 1 provides a summary of the types of collisions by intersection.

TABLE 1: COLLISION SUMMARY (MARCH 2019 TO MARCH 2024)

Head-On	Sideswipe	Rear-End	Broadside	Hit-Object	Overturn	Auto-Ped	Other	Not Stated
Seal Beach Bl. & Lampson Av. (Total: 0 Collisions)								
0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)
Old Ranch Plaza & Lampson Av. (Total: 0 Collisions)								
0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)
Basswood St. & Lampson Av. (Total: 1 Collision)								
0 (0.0%)	1 (100.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)
Candleberry Av. & Lampson Av. (Total: 1 Collision)								
0 (0.0%)	0 (0.0%)	0 (0.0%)	1 (100.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)
Heather St. & Lampson Av. (Total: 0 Collisions)								
0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)
Rose St. & Lampson Av. (Total: 2 Collisions)								
0 (0.0%)	0 (0.0%)	0 (0.0%)	1 (50.0%)	0 (0.0%)	1 (50.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)
Tulip St. & Lampson Av. (Total: 1 Collision)								
0 (0.0%)	0 (0.0%)	0 (0.0%)	1 (100.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)
Valley View St. & Lampson Av. (Total: 14 Collisions)								
2 (14.3%)	1 (7.1%)	4 (28.6%)	5 (35.7%)	1 (7.1%)	0 (0.0%)	1 (7.1%)	0 (0.0%)	0 (0.0%)

The CHP SWITRS collision data includes the following collision types:

- Head-On
- Sideswipe
- Rear-End
- Broadside
- Hit Object
- Overturned
- Vehicle/Pedestrian
- Other
- Not Stated

The Caltrans 2021 Crash Data on California State Highways report (2021 Crash Report) provides data on crash reports collected by law enforcement agencies. Calculation rates by intersection are computed for various types of facilities and settings, and then are averaged statewide. The intersection crash rate is calculated by the following formula:

Crashes / Million Vehicle (MV) Entering the Intersection

For the purposes of this analysis, average daily traffic (ADT) will be utilized to determine the crashes / MV. Existing weekday ADT volumes from the 4665 Lampson Avenue Traffic Analysis (Urban Crossroads, July 2024) are provided in Attachment B. A summary of the crash rate comparison, by intersection, is shown in Table 2.

TABLE 2: CRASH RATE COMPARISON

Intersection	Intersection Control and Setting[1]	Average Rate[2]	Crash Rate
Seal Beach Bl. & Lampson Av.	Suburban, TS, 3-leg	0.43	0.00
Old Ranch Plaza & Lampson Av.	Suburban, TS, 4-leg	0.55	0.00
Basswood St. & Lampson Av.	Suburban, TS, 4-leg	0.55	0.04
Candleberry Av. & Lampson Av.	Suburban, TS, 3-leg	0.43	0.05
Heather St. & Lampson Av.	Suburban, TS, 3-leg	0.43	0.00
Rose St. & Lampson Av.	Suburban, TS, 3-leg	0.43	0.09
Tulip St. & Lampson Av.	Suburban, TS, 4-leg	0.55	0.04
Valley View St. & Lampson Av.	Suburban, TS, 4-leg	0.55	0.19

[1] TS = Traffic Signal

[2] Source: Intersection crash rates from the Caltrans 2021 Crash Data on California State Highways report

Basswood St. & Lampson Av. had a total of 1 reported collision in a 5-year period. The common collision included a sideswipe collision. Sideswipe collisions are commonly caused by failure to yield or impaired/distracted driving. The 5-year average rate for this intersection is calculated as followed:

(1 collision / 5 years) / (365 days/year x (29,200 ADT / 2) / 1,000,000 MV) **= 0.04 total crashes per MV**

The intersection of Basswood St. & Lampson Av. has a lower crash rate than the state average for similar facilities.

Candleberry Av. & Lampson Av. had a total of 1 reported collision in a 5-year period. The common collision include a broadside collisions. Broadside collisions are commonly caused by failure to yield, failure to stop, or impaired/distracted driving. The 5-year average rate for this intersection is calculated as followed:

(1 collision / 5 years) / (365 days/year x (24,600 ADT / 2) / 1,000,000 MV) **= 0.05 total crashes per MV**

The intersection of Candleberry Av. & Lampson Av. has a lower crash rate than the state average for similar facilities.

Rose St. & Lampson Av. had a total of 2 reported collisions in a 5-year period. The common collisions include broadside and overturn collisions. Overturned vehicles are commonly caused by unsafe speeds, improper maneuvers, or loss of vehicle control. The 5-year average rate for this intersection is calculated as followed:

(2 collisions / 5 years) / (365 days/year x (23,500 ADT / 2) / 1,000,000 MV) **= 0.09 total crashes per MV**

The intersection of Rose St. & Lampson Av. has a lower crash rate than the state average for similar facilities.

Tulip St. & Lampson Av. had a total of 1 reported collision in a 5-year period. The common collision include a broadside collision. The 5-year average rate for this intersection is calculated as followed:

(1 collision / 5 years) / (365 days/year x (25,050 ADT / 2) / 1,000,000 MV) **= 0.04 total crashes per MV**

The intersection of Tulip St. & Lampson Av. has a lower crash rate than the state average for similar facilities.

Valley View St. & Lampson Av. had a total of 14 reported collisions in a 5-year period. The common collision include rear-end and broadside collisions. Rearend collisions are commonly caused by failure to yield, failure to stop, or impaired/distracted driving. The 5-year average rate for this intersection is calculated as followed:

(14 collisions / 5 years) / (365 days/year x (82,350 ADT / 2) / 1,000,000 MV) **= 0.19 total crashes per MV**

The intersection of Valley View St. & Lampson Av. has a lower crash rate than the state average for similar facilities.

The existing crash rates for the study area intersections are lower than the statewide average crash rates as determined by the 2021 Crash Report.

A Project would have the potential to create an increase in collision rate if it introduced a geometric design feature that did not meet safety standards or incompatible uses (e.g. farm

equipment). As demonstrated in the analysis below, implementation of Project improvements (within the public right-of-way) per Los Alamitos and Seal Beach standards ensures all that sight distance requirements, pedestrian crossing requirements, and street design requirements are met. Additionally, the Project vehicle mix is consistent with the adjacent land uses, including the residential neighborhood to the south. ***Therefore, it is not anticipated that the Project will result in a significant change in collision rates or result in an accident rate higher than the statewide average.***

BICYCLE & PEDESTRIAN FACILITIES

In an effort to promote alternative modes of transportation, the City of Los Alamitos and Seal Beach have several existing and planned bicycle routes. There are existing Class II (on-street, striped) bike lanes on the north and south sides of Lampson Avenue from Basswood Street to the east. In addition, there is a Class I bike/pedestrian path on Seal Beach Boulevard north of Lampson Avenue and a Class II bike lane south of Lampson Avenue. The Project should maintain the existing Class II bike lane on Lampson Avenue along its frontage to maintain bicycle safety. The existing sidewalks adjacent to the Project met design standards and any Americans with Disabilities Act (ADA)[3] standards at the time they were constructed. The City of Los Alamitos and Seal Beach should continue to improve pedestrian facilities to increase the desire to bike or walk and meet current standards.

The sidewalks along the Project frontage will be improved as part of the Project. Frontage improvements will include sidewalks, driveway modifications to accommodate site access, median modifications, and landscaping improvements as required by City of Los Alamitos[4] and City of Seal Beach[5] standards. The proposed sidewalk along the Project's frontage on the north side of Lampson Avenue will provide connectivity with proposed sidewalks and paths internal to the Project.

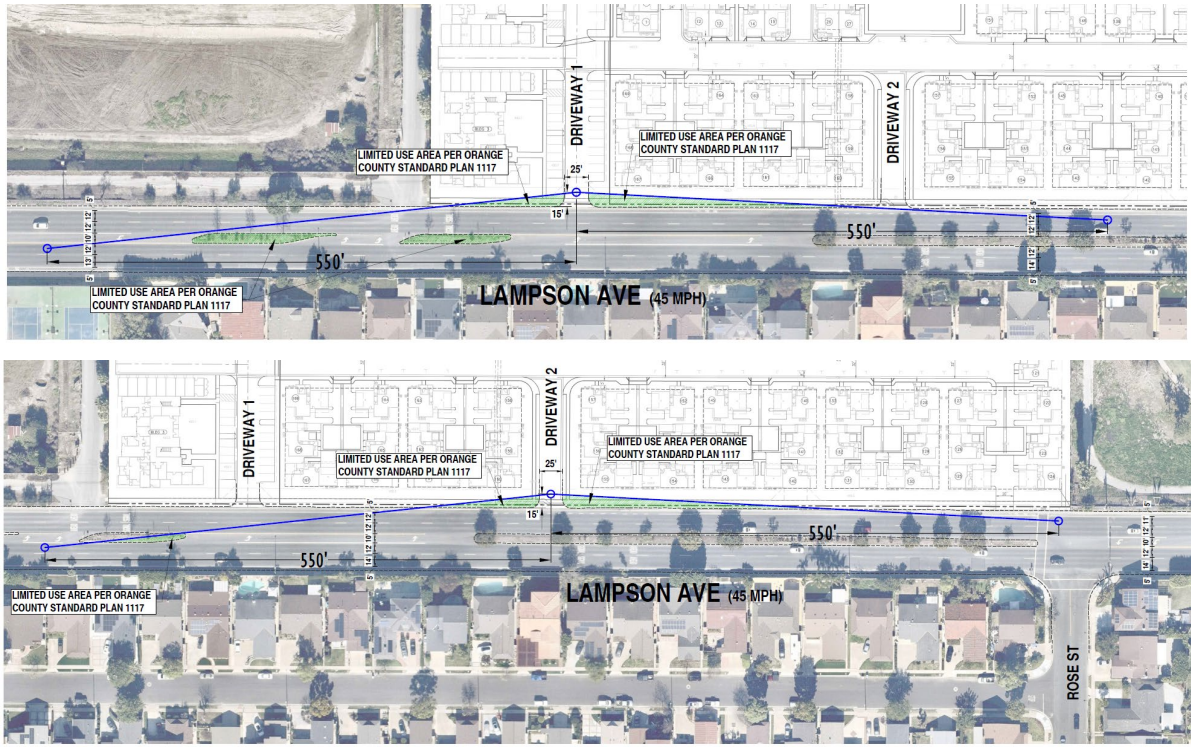
The intersections at Lampson Avenue at Heather Avenue and Lampson Avenue at Rose Avenue are currently signalized and both have pedestrian crosswalks for Lampson Avenue. The wheelchair ramp on the north side of Lampson Avenue at Heather Avenue does not meet ADA requirements, as shown in Exhibit 2. However, the wheelchair ramp on the north side of Lampson Avenue at Rose Avenue does meet ADA standard requirements.

[3] Source: ADA Standards for Accessible Design https://www.ada.gov/law-and-regs/design-standards/

[4] Source: City of Los Alamitos Public Works and Engineering Standards https://cityoflosalamitos.org/205/Public-Works-Engineering

[5] Source: City of Seal Beach Standard Plans for Streets, Sewers, Water: https://www.sealbeachca.gov/Departments/Public-Works/Administration-Engineering

EXHIBIT 2: LAMPSON AVENUE AT HEATHER AVENUE RAMP



All Project driveways should be designed to meet current City standards and accommodate pedestrian crossing per current ADA standards. The Project should also maintain the existing Class II (on-street, striped) bike lanes along its frontage on Lampson Avenue. These improvements will ensure the project meets all compliance requirements.

INTERSECTION SIGHT DISTANCE

Attachment C identifies limited use areas per Orange County Standard Plan[6] 1117 – Intersection Sight Distance. The limited use areas determine the necessary sight distance to allow 7 ½ seconds for the driver on the crossroad (or left turn pocket) to safely cross the main roadway or turn left while the approach vehicle travels at the assumed design speed of the main roadway. All Project driveways should be required to meet these sight distance requirements. Exhibit 3 shows sight distance requirements for Driveways 1 and 2, as shown, the Project does not create any new sight distance issues along Lampson Avenue (A full size version is included in Attachment C, Page 2) and meets all compliance requirements.

[6] *Source: Orange County Public Works Standard Plans: https://ocpublicworks.com/ocpw/oc-public-works-standard-plans*

EXHIBIT 3: DRIVEWAYS 1 AND 2 SIGHT DISTANCE

STOPPING SIGHT DISTANCE

According to the Highway Design Manual[7] (HDM), stopping sight distance is the minimum sight distance for a given design speed to be provided on multilane highways, and on 2-lane roads, when passing sight distance is not economically obtainable. Stopping sight distance is to be provided for all users, including motorists and bicyclists, at all elements of interchanges and intersections at grade, including private road connections. Lampson Avenue has a posted speed limit of 45 MPH. As stated in the HDM Table 201, a stopping sight distance of 360 feet is the standard for a design speed of 45 MPH. The Project does not introduce any new stopping sight distance issues to Lampson Avenue and meets all compliance requirements.

ON-SITE VEHICLE CIRCULATION

Attachment D identifies the on-site circulation for the site based on the plans prepared by C&V Consulting, Inc. The exhibits identify various vehicle paths (front-loading garbage trucks, fire trucks, delivery trucks, etc.) for various internal drive aisles, which allow for two-way traffic. Access to and from the site will be accommodated via driveways on Lampson Avenue. As shown in Attachment D, the vehicle turning templates show acceptable turning movements for the various vehicles and trucks anticipated to access the site.

[7] *Source: California Department of Transportation Highway Design Manual: https://dot.ca.gov/programs/design/manual-highway-design-manual-hdm*

SITE ACCESS

The following improvements are recommended and will be constructed as part of the Project to accommodate site access.

Driveway 1 & Lampson Avenue (#6) – Project will implement a stop control for egress traffic at Driveway 1 on Lampson Avenue. The intersection is proposed to be restricted to right-in/right-out access only. The access at this driveway should be controlled by a raised median.

Driveway 2 & Lampson Avenue (#7) – Driveway 2 is not anticipated to meet a peak hour or planning level (daily volume) based traffic signal warrant under any of the analysis scenarios. The Project frontage roadway of Lampson Avenue is currently constructed to its ultimate General Plan roadway classification. As such, frontage improvements will be limited to sidewalk improvements, driveway modifications to accommodate site access, median modifications, and landscaping improvements as required per City standards. Any Project-related improvements shall meet sight distance and all requirements within the public right of way per City of Los Alamitos and Seal Beach standards. On-site traffic signing and striping should be implemented in conjunction with detailed improvement plans for the Project site.

SUMMARY OF PROJECT IMPROVEMENTS

Frontage improvements will include sidewalk improvements, driveway modifications to accommodate site access, and landscaping improvements as required by City standards. The proposed sidewalk along the Project's frontage on the north side of Lampson Avenue will provide connectivity with proposed sidewalks and paths internal to the Project. The Project will also maintain the existing Class II (on-street, striped) bike lanes along its frontage on Lampson Avenue.

The Project frontage roadway of Lampson Avenue is currently constructed to its ultimate General Plan roadway classification. As such, frontage improvements will be limited to sidewalk improvements, driveway modifications to accommodate site access, and landscaping improvements as required by City standards.

CONCLUSION

A review of available collision data indicates that the study area intersections have lower crash rates than the statewide average of intersections with similar configuration and settings. The addition of Project traffic is not anticipated to increase the crash rates by a significant margin. As discussed throughout this evaluation, the implementation of Project improvements (within the public right of way) per Los Alamitos, Seal Beach, Orange County Public Works, Highway Design Manual (HDM), and American with Disabilities Act (ADA) standards ensures all sight distance requirements, pedestrian crossing requirements, and street design requirements are met. Additionally, the Project TIA indicates the highest peak hour volume along Lampson Avenue at Driveway 2 is 561 vehicles (Refer to Exhibit 3-8 of the TIA). The highest Project peak hour volume of 50 vehicles occurs at Driveway 2 in the evening (Refer to Exhibit 4-2 of the TIA). The Project contributes 9% of the additional vehicles to the evening peak hour ([50/561]*100=9%). Therefore, the addition of Project-related traffic is not anticipated to increase the accident rate above the nationally accepted average or cause new safety deficiencies.

If you have any questions or comments, we can be reached at jalire@urbanxroads.com.

Re: Will Serve Letter
4665 Lampson Avenue
Los Alamitos, California 90720

Dear Dane McDougall,

This letter is to inform you that water service is available to the above referenced address from Golden State Water Company's (GSWC) Orange County District water system. Service to the address can be provided from our existing water facilities within Lampson Avenue.

Upon completion and execution of a Water Service Agreement, that contains satisfactory financial arrangements and other provisions governing the extension of water service, Golden State Water Company (GSWC) will begin providing water service for the referenced address once all owner obligations have been satisfied. Analysis of more detailed development plans may require the owner to participate in the construction of special facilities prior to the Company providing water service.

GSWC is committed to providing water service to all customers within its service area, consistent with the company's obligations under rules, statutes and regulations of both the California Department of Public Health and the California Public Utilities Commission.

Unless modified or extended by GSWC, this Will Serve Letter shall terminate and be of no further force and effect one year from the date indicated above.

If you have any questions concerning the issues addressed in this letter, please let us know.

Sincerely,

Digitally signed by Melynda L. Holm

Lampson Los Al

4665 Lampson Avenue, Los Alamitos 90720

Your project is located in Southern California Edison (SCE) service territory. SCE will serve the above subject project's electrical requirements per the California Public Utilities Commission and Federal Energy Regulatory Commission tariffs.

SCE may need to conduct utility studies, where applicable, to assess whether additions or modifications to the existing electric infrastructure are required to serve this project. Where applicable, SCE has attached Appendix (B) which not only describes the study, and permitting, but includes a Project Information Sheet that will need to be completed by you and submitted to SCE if your project is at a point where SCE has to determine the required electrical utility work. This Will-Serve letter does not imply that either: (i) these studies have been completed, or (ii) that any required California Environmental Quality Act (CEQA) analysis of project-related electric utility impacts has been conducted.

I am the SCE Design Representative currently assigned to this project. SCE or Applicant will design and construct all required electrical infrastructure to serve this project provided you enter into the applicable contractual agreements with SCE identify scope of electrical utility work required, and supply the following information:

- Site plans as required
- Required contracts and agreements (fully executed)
- Applicable fees
- Local permits
- Required easement documents

Your project will be scheduled for construction once SCE has all the necessary information for your project and you have submitted or agreed to the applicable requirements as stated above, and paid any necessary fees.

If your project will not require SCE services, please notify us so that we can update our records.

SCE appreciates your business. If you have any questions, please feel free to call me at (714) 296-7609.

Sincerely,

SCE Design Representative

Mr. Duarte,

Universal Waste Systems Inc. has reviewed the plan and is currently able to provide service as outlined for your project at Los Alamitos- Lampson Ave. It is hard to tell exact measurements from what is provided, but if they are designed for large collection trucks then we will service as outline in the proposal.

If you have any questions please let me know.

Thank you

RE: OLD RANCH COUNTRY CLUB SPECIFIC PLAN PROJECT, SEAL BEACH – SEWER DEMAND CALCULATIONS

We have been asked to evaluate sewer capacity conditions related to further refinements of the proposed Old Ranch Country Club Project located at 3901 Lampson Avenue in the City of Seal Beach in the context of the proposed 4665 Lampson Avenue Project located in the City of Los Alamitos. Additionally, this memorandum describes revisions made to the Sanitary Sewer Analysis to address comments received from the City of Seal Beach.

As background for this request, the City of Seal Beach's updated Sewer Master Plan (September 2022) identified the sewer loads for potential development areas within the City of Seal Beach. Those sewer loads are summarized in Table 1 of that Sewer Master Plan, which is shown below. The Old Ranch Country Club is listed as Site B-5, and it is identified as comprising 150 acres, five of which are indicated as "redevelopment area." Table 1 also identifies the Old Ranch Country Club development area as including 120 potential dwelling units resulting in a sewer load of 19,200 gallons per day (gpd).

Table 1
Potential Development Areas (September 2022)
Sewer Load Summary Table

[a]This development area is not within the City of Seal Beach's sewer service area
[b]The sewage generated in this development area is assumed to be conveyed to Aquatic Park lift station. The lift station is not in the hydraulic model. Sewage is pumped from the lift station to the City of Huntington Beach's sewer system,

Since 2022, the proposed development of the Old Ranch Country Club Project has been further refined, and as of January 2023 now includes more than the residential component identified in Table 1 of the Sewer Master Plan. Per the Initial Study dated February 7, 2023, prepared to support the Old Ranch Country Club Specific Plan, the anticipated redevelopment area has increased from 5 acres to approximately 35 acres over the existing site, and

includes a 116-unit multi-family housing development, a 51-unit senior housing complex including an approximately 25,340 square foot medical office facility on the ground floor, a 150-key overnight accommodation, an approximately 2,650 square foot relocated maintenance facility, a parking structure, and a new clubhouse pool and associated structures (21,000 square feet) abutting the existing clubhouse.

This more refined development proposal for the Old Ranch Country Club project would result in an increase in thesewer demand. The following table and corresponding calculations have been developed to determine the anticipated increased sewer demand associated with the more current Old Ranch Country Club Project proposal. Flow factors as provided by City of Seal Beach were utilized for residential land uses and additional flow factors from the Orange County Sanitation District (OSCD) were utilized for office, hotel, and commercial/ office (medical) land uses.

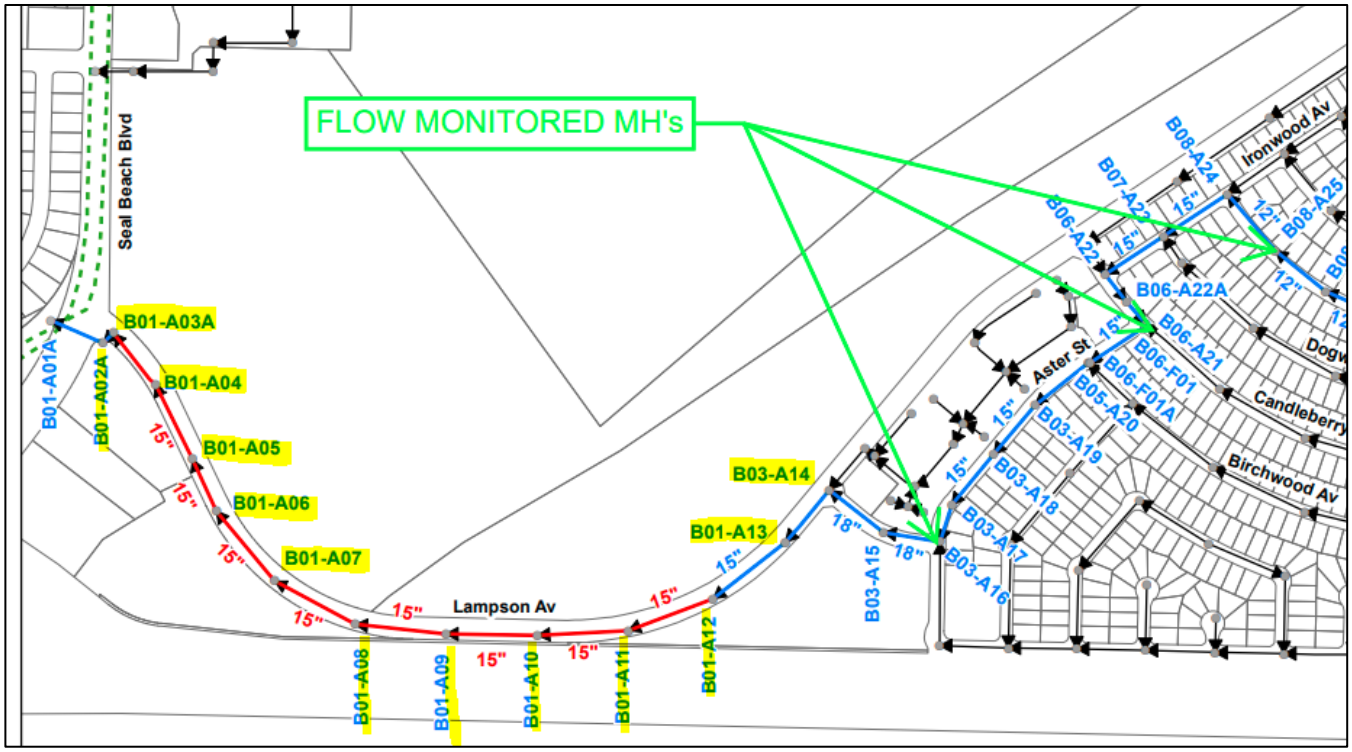
Redeveloped Land	Units	Area (SF)	Area (AC)	Land Use Category	Flow Factor	Unit	Flow (GPD)
Multi-Family Housing	116	188,500	4.33	Residential High Density*	160	GDP/DU	18,560
Senior Housing Complex	51	25,340	0.58	Residential High Density*	160	GDP/DU	8,160
Medical Office	1	25,340	0.58	Office**	2,262	GPD/AC	1,316
Hotel	150	109,015	2.50	Hotel**	150	GPD/Room	22,500
Parking Structure	1	226,441	5.20	N/A	-		0
Clubhouse	1	21,000	0.48	Commercial/Office**	2,262	GPD/AC	1,090
Total	--	595,636	13.67	--	--		51,626
*Flow Factor per City of Seal Beach Sewer Master Plan 2018							
**Flow Factor per OCSD Wastewater Flow Estimates for Development Planning							

The relocated maintenance facility comprising approximately 2,650 square feet was not included in this analysis because this facility is being relocated and is not a new facility.

As shown in the Potential Development Areas (September 2022) table set forth above, the 120 dwelling units of the Old Ranch Country Club Project is anticipated to generate a sewer demand of 19,200 gpd, and as shown in the summary above, the further refined proposal for the Old Ranch Country Club Project is anticipated to generate a sewer demand of 51,626 gpd. This is an increase in total demand of approximately 32,426 gpd (0.0502 cfs).

As explained in the Draft Environmental Impact Report for the 4655 Lampson Avenue project, a Sanitary Sewer Analysis (September 2022) was prepared for the 4655 Lampson Avenue Project which evaluated proposed sewer demands anticipated by the Project and downstream segments. Sewer manhole monitoring was conducted in September 2022 to determine the actual discharge at three manholes (MH): (1) Basswood and Aster Street (Manhole A-16); (2) Candleberry Avenue and Aster Street (Manhole A-21); and (3) Elder Avenue (Manhole A-25). In response to comments received from the City of Seal Beach on the Sanitary Sewer Analysis dated September 2022, a revised Sanitary Sewer Analysis was prepared in March 2024. Sewer system model data was provided by the City of Seal Beach (AKM's City wide sewer study) utilizing an area calculation method which indicated there are 16 sewer segments shown to have a d/D level above 0.5. Because the area calculation is used to calculate flows for large areas and is not necessarily representative of actual flows, actual monitored flows were determined and evaluated. Using the actual monitored flows indicated that there are only 7 segments estimated to exceed the City's peak dry weather flows (PDWF) d/D criteria after the proposed project is implemented. The remaining capacity above a PDWF d/D of 0.50 is reserved for wet weather flows. Flows over the d/D criteria range from 0.51 to 0.55 and represent approximately 56% of the pipe's flow capacity, which is well within the capacity of the downstream sewer lines.

No additional pipe segments in the AKM study were found to be undersized. The nine (9) segments that were found to be undersized in AKM's study were determined to be acceptable after analyzing using the actual monitored flows. The d/D levels are shown to be higher because the existing segments have flat slopes, ranging from 0.16% - 0.22%. However, the pipe size can handle proposed flow levels, and sewer pipe upgrades are not required.



To evaluate a potential increase in the flow depth to pipe diameter ratio (d/D) based on the increase in total demand associated with the further refined Old Ranch Country Club project and after taking into consideration the amount of sewer discharge associated with the 4655 Lampson Avenue project, C&V Consulting, Inc. applied the increase in total demand from the further refined Old Ranch Country Club Project to manhole (MH) IDs B03-A14 and B01-A13 through B01-A02A, as shown below. These manholes and their associated pipeline segments are located downstream of the three manholes that were monitored for the 4655 Lampson Avenue Project and as such include the upstream sewer flows anticipated by the 4655 Lampson Avenue Project and currently existing development. The Draft Environmental Impact

Report concluded that the proposed flows from the 4655 Lampson Avenue Project, in addition to the observed flows, create a proposed depth of flow that would not impact the existing surrounding sanitary sewer systems, and that the existing sewer system has adequate capacity for the proposed development.

Per the following table, the overall d/D is anticipated to be less than 0.5 for the identified segments with the increased demand added to the system. This means that when the sewer flows from the further refined Old Ranch Country Club Project are added to the sewer flows from the 4655 Lampson Avenue Project based on the downstream monitored manhole flows, the depth of flow to pipe diameter ratio is less than 50%. This in turn means that even with the Old Ranch Country Club Project, the sewer pipe system capacity remains capable of maintaining an adequate flow well below 50% of its flow depth capacity. As such, adequate capacity exists to serve the 4655 Lampson Avenue Project's projected demand in addition to the sewer pipe systems existing commitments, even after taking into account the Old Ranch Country Club Project. The anticipated d/D increase determined from the 4665 Lampson Avenue Project plus the Old Ranch Country Club Project is approximately 2.6-3.4%, which is considered negligible.

ID	PDWF Total Flow (cfs)	PDWF d/D	Total PDWF + Old Ranch Redevelopment Area (cfs)	Calculated Depth (ft)	Calculated PDWF d/D	d/D Percent Incease

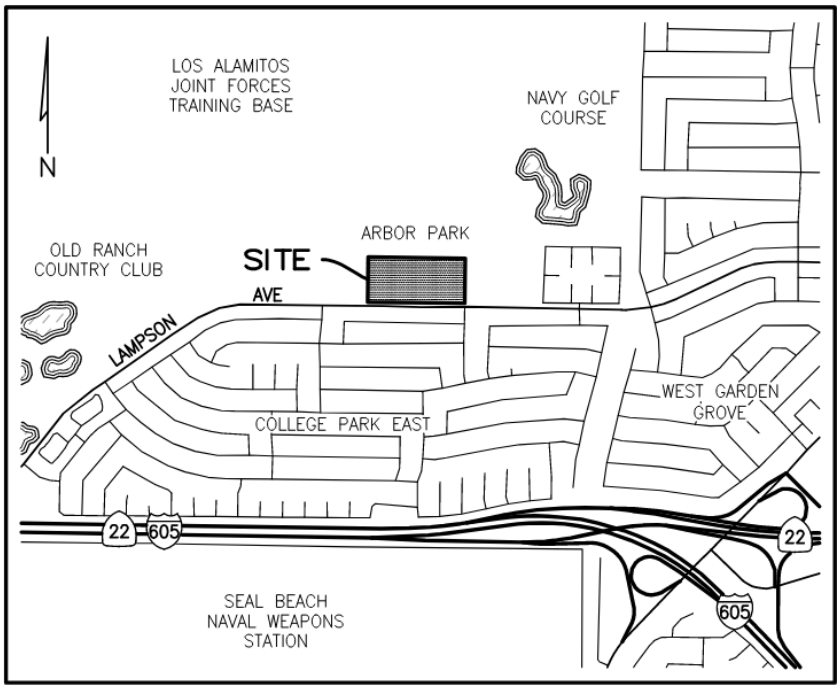
INTRODUCTION



The following study has been prepared by C&V Consulting, Inc. to determine and illustrate:

- ***A.*** The capacity of the existing sewer segments from the proposed development site to the OCSD Sewer Trunk.
- ***B.*** If the existing sewer facilities will adequately service the proposed development.

Although the project site is in the City of Los Alamitos, the City of Seal Beach is providing sewer service to the proposed development which falls within the Rossmoor/Los Alamitos Area Sewer District (RLAASD). The sewer system conveys wastewater from the service area for treatment by the Orange County Sanitation District (OCSD). This study utilizes a sewer monitoring method to determine the results. The report will analyze the existing capacity and how the future flows from the proposed development will impact the sewer system and all reaches from the site point of connection to the OCSD Sewer Trunk.

SITE DESCRIPTION

The project site comprises a gross total of 12.367 acres and is located at 4665 Lampson Ave., at the northwest corner of Rose Street and Lampson Avenue, in the City of Los Alamitos, California (APN: 130-012-35). The site is bounded by Lampson Avenue to the south, Arbor Park to the north and east, and undeveloped land to the west.

PROJECT DESCRIPTION

The development proposes the construction of 246 total units (77 affordable apartment units, 55 detached SFD units, and 114 townhouse units) with private garages, private drive aisles, sidewalks, guest parking areas, and common landscaped areas.

Project Site	Size (ac)
Total Project Area (APN: 130-012-35)	12.367

METHODOLOGY/EXISTING CONDITIONS

The study will investigate the sewerage discharge route from the proposed development (TTM No. 22-01) to the OCSD Sewer Trunk. The existing sewer mains have flats slopes with most ranging with slopes of (0.1%-0.2%).

Sewer Monitoring Method

Basswood Street and Aster Street Intersection

As part of this study for the sewer monitoring analysis, the project was conditioned to flow monitor the existing conditions at northern inlet of Manhole B03-A16 of the 15" local main, located in the Basswood Street and Aster Street Intersection by ADS. The flow monitoring took place from 8/23/22 to 9/5/22.

Candleberry Avenue and Aster Street Intersection

As part of this study for the sewer monitoring analysis, the project was conditioned to flow monitor the existing conditions at northern inlet of Manhole B06-A21 of the 17.88" xx 17" (H x W) elliptical local main, located in the Candleberry Avenue and Aster Street Intersection by ADS. The flow monitoring took place from 8/23/22 to 9/5/22.

Elder Avenue

As part of this study for the sewer monitoring analysis, the project was conditioned to flow monitor the existing conditions at northern inlet of Manhole B08-A25 of the 12" local main, located in Elder Avenue by ADS. The flow monitoring took place from 8/23/22 to 9/5/22.

SEWER PIPE CAPACITY ANALYSIS

Sewer Monitoring Method

AKM provided "Table 2 Hydraulic Analysis Results For Sewers Downstream of West Ed Development" highlighting the reaches suspected to have d/D levels above 0.5.

However, the monitored manholes show a lower flow average than the table provided by AKM.

Using "Table 2 Hydraulic Analysis Results For Sewers Downstream of West Ed Development", ratios were used from the flow monitored averages to calculate the flows for all reaches upstream of the monitored manholes. For reaches downstream of the monitored manholes, the delta flow value was added to the last monitored manholes to calculate the flow for the remaining reaches.

The average dry weather flow was used to calculate the peak dry weather flows (PDWF). The PDWF was used to calculate the d/D levels for each sewer segment.

Sewer pipes were analyzed per City of Seal Beach Sewer Master Plan 2018 Table ES-1, for a maximum design depth at half-full for pipe sized at 15" or under.

The "Unit Flow Factors" Table 3-1 per the City of Seal Beach Sewer Master Plan 2018 was utilized for this method to obtain the peak flow generated from the proposed residential project site. It was determined from the architectural plans for the 246 residential unit (20.33 DU/AC) project has a proposed zoning of Adopted R-3 Ordinance. It is assumed that this zoning is equivalent to the "Residential High Density" Land Use from the "Unit Flow Factors." The project is estimated to be a total average flow output of 39,360 GPD (0.0609 cfs) of effluent.

Refer to the Sewer Monitoring Study Table in Appendix A for calculation details for all reaches.

CONCLUSION

The d/D results from this study were calculated using methods provided by ADS and Manning's equation. Based on the sewer analysis on future developed land use provided in AKM's City wide sewer study, there are 16 sewer segments shown to have a d/D level above 0.5. Then, as analyzed per actual monitored flows, there are only 7 segments estimated to exceed the City's PDWF d/D criteria after the proposed project is implemented. The remaining capacity above a PDWF d/D of 0.50 is reserved for wet weather flows. No additional pipe segments that were found in the AKM study were found to be undersized. 9 segments that were found to be undersized in AKM's study were found to be acceptable after analyzing using the monitored flows. Typically, the pipe size can handle these flow levels, however, the existing segments has flat slopes (ranging from 0.16%-0.22%) which causes the d/D levels to be higher.

SUBJECT: 4665 Lampson Ave Sewer Study

Dear Mr. Kawamura,

ADS is pleased to submit the report for the 4665 Lampson Ave Sewer Study completed on behalf of KHR Associates. The metering was conducted at three (3) locations. The study was conducted during the period of Tuesday, 23 August 2022 to Monday, 05 September 2022.

The report contains depth, velocity, and quantity hydrographs as well as daily long tables for the metering period. An Excel file containing depth, quantity, and velocity entities for the monitoring location in 5-minute format has been provided.

In addition, we would be happy to further explain any details about the report that may seem unclear. Should you have any questions or comments, you may contact the Project Manager, Shay Koerber at (619) 520-9168.

It has been our pleasure to be of service to you in the performance of this project. Thank you for choosing ADS products and services to meet your flow monitoring needs.

Sincerely,
ADS ENVIRONMENTAL SERVICES

Justin Hatch

Scope and Methodology

Introduction

KHR Associates entered into an agreement with ADS Environmental Services to conduct flow monitoring at (3) three locations in the Seal Beach Sanitary Collection System. The study was scheduled for a period of (14) fourteen days. Once in place, the flow monitoring equipment was used to measure depth, velocity, and to quantify flows. Data obtained from the study will be used to determine existing sewer flow rates and capacity to support development of a new residential redevelopment project tributary to these locations.

Project Scope

The scope of this study involved using a flow monitor to quantify wastewater flow at the designated locations for the 14-day time period. Specifically, the study included the following key components.

- Investigate the proposed flow-monitoring sites for adequate hydraulic conditions
- Flow monitor installations
- Flow monitor confirmations and data collections
- Flow data analysis

Equipment installation was completed on August 22, 2022. The monitoring began on August 23, 2022 and was completed on September 5, 2022. Upon completion of the study, equipment was removed from the system.

Flow Monitoring Equipment

The ***ADS Trinton+*** monitor was selected for this project. This flow monitor is an area velocity flow monitor that uses both the Continuity and Manning's equations to measure flow.

The ADS Triton+ monitor consists of data acquisition sensors and a battery-powered microcomputer. The microcomputer includes a processor unit, data storage, and an on-board clock to control and synchronize the sensor recordings. The monitor was programmed to acquire and store depth of flow and velocity readings at 5-minute intervals.

The Triton+ monitor features cross-checking using multiple technologies in each sensor for continuous running of comparisons and tolerances. The Triton+ monitor can support two (2) sets of sensors. The sensor option used for this project was:

The Peak Combo Sensor installed at the bottom of the pipe includes three types of data acquisition technologies.

The ***up looking ultrasonic depth*** uses sound waves from two independent transceivers to measure the distance from the sensor upward toward the flow surface; applying the speed of sound in the water and the temperature measured by

sensor to calculate depth.

The ***pressure depth*** is calculated by using a piezo-resistive crystal to determine the difference between hydrostatic and atmospheric pressure. The pressure sensor is temperature compensated and vented to the atmosphere through a desiccant filled breather tube.

To obtain ***peak velocity*****,** the sensor sends an ultrasonic signal at an angle upward through the widest cross-section of the oncoming flow. The signal is reflected by suspended particles, air bubbles, or organic matter with a frequency shift proportional to the velocity of the reflecting objects. The reflected signal is received by the sensor and processed using digital spectrum analysis to determine the peak flow velocity.

Installation

Installation of flow monitoring equipment typically proceeds in four steps. First, the site is investigated for safety and to determine physical and hydraulic suitability for the flow monitoring equipment. Second, the equipment is physically installed at the selected location. Third, the monitor is tested to assure proper operation of the velocity and depth of flow sensors and verify that the monitor clock is operational and synchronized to the master computer clock. Fourth, the depth and velocity sensors are confirmed and line confirmations are performed.

In pipes up to 42 inches in diameter, the sensors were mounted on expandable stainless steel rings, inserted at least a foot upstream into influent pipes and tightened against the inside walls of the pipes. Influent pipe installations reduce the influences of turbulence and backwater often caused by changes in channel geometry in manholes.

Data Collection, Confirmation, and Quality Assurance

Data collection was done remotely via wireless connect on a weekly basis via ADS Field Representatives. During the monitoring period, field crews visit each monitoring location to verify proper monitor operation and document field conditions. The following quality assurance steps are taken to assure the integrity of the collected data:

Measure power supplies: monitors were powered by dry cell battery packs. Voltages were recorded and battery packs replaced, as necessary. Separate batteries provided back-up power to memory allowing primary batteries to be replaced without loss of data.

Clock synchronization: Field crews synchronized monitor clocks to master clocks.

Confirm depth and velocity readings: Field crews descended into meter manholes to manually measure depths and velocities and compare them meter readings to confirm that they agreed. They also measured silt levels, if any, in the inverts of the pipes. Silt areas were subtracted from flow areas to compute true areas of flow.

Confirm average velocities through cross-sectional velocity profiles: Since ADS velocity sensors measure peak velocity, field crews collected cross-sectional velocity profiles in order to develop a relationship between peak and average velocity in lines that meet the hydraulic criteria.

Upload and Review Data: Data collected from the monitors were uploaded and reviewed by a Data Analyst for completeness, outliers and deviations in the flow patterns, which indicate system anomalies or equipment failure.

Flow Quantification Methods

There are two main equations used to measure open channel flow: the ***Continuity Equation*** and the ***Manning Equation.*** The Continuity Equation, which is considered the most accurate, can be used if both depth of flow and velocity are available. In cases where velocity measurements are not available or not practical to obtain, the Manning Equation can be used to estimate velocity from the depth data based on certain physical characteristics of the pipe (i.e. the slope and roughness of the pipe being measured). However, the Manning equation assumes uniform, steady flow hydraulic conditions with non-varying roughness, which are typically invalid assumptions in most sanitary sewers. The Continuity Equation was used exclusively for this study.

Continuity Equation

The Continuity Equation states that the flow quantity (Q) is equal to the wetted area (A) multiplied by the average velocity (V) of the flow.

Q = A * V

This equation is applicable in a variety of conditions including backwater, surcharge, and reverse flow.

Data Analysis and Presentation

Data Analysis

A flow monitor is typically programmed to collect data at 5-minute intervals throughout the monitoring period. The monitor stores raw data consisting of (1) the ultrasonic depth, (2) the peak velocity and (3) the pressure depth. The data is imported into ADS's proprietary software and is examined by a data analyst to verify its integrity. The data analyst also reviews the daily field reports and site visit records to identify conditions that would affect the collected data.

Velocity profiles and the line confirmation data developed by the field personnel are reviewed by the data analyst to identify inconsistencies and verify data integrity. Velocity profiles are reviewed and an average to peak velocity ratio is calculated for the site. This ratio is used in converting the peak velocity measured by the sensor to the average velocity used in the Continuity equation. The data analyst selects which depth sensor entity will be used to calculate the final depth information. Silt and/or debris are often present in sewer lines. When present, silt levels are measured at each site visit. They are reviewed by the data analyst and representative silt levels established. Silt reduces the cross sectional area of the flow where as debris causes depth to become deeper and slower. Calculated flow should remain consistent in both hydraulic conditions. Debris may result in reduced line capacity.

Occasionally the velocity sensor's performance may be compromised resulting in invalid readings sporadically during the monitoring period. This is generally caused by excessive debris (silt) blocking the sensor's crystals, shallow flows (~< 1") that may drop below the top of the sensor or very clear flows lacking the particles needed to measure rate. In order to use the Continuity equation to quantify the flow during these periods, a Data Analyst and/or Engineer will use the site's historical pipe curve (depth vs. velocity) data along with valid field confirmations to reconstitute and replace the false velocity recordings with expected velocity readings for a given historical depth along the curve.

Selections for the above parameters can be constant or can change during the monitoring period. While the data analysis process is described in a linear manner, it often requires an iterative approach to accurately complete.

Data Presentation

This type of flow monitoring project generates a large volume of data. To facilitate review of the data, results have been provided in graphical and tabular formats. The flow data is presented graphically in the form of scattergraphs and hydrographs. Hydrographs are based on 5 minute averaging. Tables are provided in daily average format. These tables show the flow rate for each day, along with the daily minimum and maximums, the times they were observed, the total daily flow, and total flow for the month (or monitoring period). The following explanation of terms may aid in interpretation of the tables and hydrographs.

DFINAL - Final calculated depth measurement (in inches)

QFINAL - Final calculated flow rate (in MGD)

VFINAL - Final calculated flow velocity (in feet per second)

REPORT TOTAL - Total volume of flow recorded for the indicated time period (in MG)

OBSERVATIONS

Average flow depth, velocity, and quantity data observed during **Tuesday, 23 August 2022 to Monday, 05 September 2022**, along with observed minimum and maximum data, are provided in the following table.

Observed Flow Conditions			
Item	**DFINAL (in)**	**VFINAL (ft/s)**	**QFINAL (MGD - Total MG)**
Average	3.48	1.45	0.215
Minimum	2.09	0.79	0.055
Maximum	4.52	1.94	0.391
Min Time	08/30/2022 05:05:00	09/03/2022 05:20:00	08/30/2022 05:15:00
Max Time	08/29/2022 21:20:00	08/29/2022 21:15:00	08/29/2022 21:15:00

Based upon the quality and consistency of the observed flow depth and velocity data, the Continuity equation was used to calculate flow rate and quantities during the monitoring period.

Values in the Observed Flow Conditions and data on the graphical reports are based on the five minutes average.

DATA UPTIME

Data uptime observed during **Tuesday, 23 August 2022 to Monday, 05 September 2022** is provided in the following table:

SECTION 3
CRITERIA

3-1 GENERAL

Establishing performance standards is an important part of evaluating the existing wastewater collection system, as it forms the basis for most of the system improvement recommendations. These standards include methodology for estimating wastewater flows, and minimum design standards for the collection system pipes, pump stations and force mains.

Average dry weather wastewater flows can be reasonably estimated from land use and unit flow factors, with the results then compared to measured flows. The components used to estimate design wastewater flows include unit flow factors, peaking factors, and infiltration/inflow allowances.

Collection system design standards include minimum pipe size, minimum flow velocity, and depth of flow to pipe diameter ratio. Pump station criteria includes sizing requirements for pumps, wet wells and forcemains. It also includes provisions for redundancy, emergency storage, emergency power, and remote monitoring and control.

3-2 UNIT FLOW FACTORS

Previous Master Plan studies developed unit flow factors for the various land uses within the City's service area. These unit flow factors, shown in Table 3-1, were developed from flow monitoring data, flow records at Pump Station No. 35, water meter records, and the census data provided in the City's General Plan. The Orange County Sanitation District (OCSD) recommended wastewater flow generation factors were used for manufacturing and public recreation land uses.

For this Master Plan study, the sewage loads utilized in the hydraulic model were based on the average FY 2014-2015 pump flow data at all sewer pump stations. This data was compiled from weekly meter readings recorded by City staff.

Current sewage loads are significantly lower than the previously estimated loads developed using unit flow factors and land use information.

Table 3-1
Unit Flow Factors

Land Use Category		Unit Flow Factor	
Use	Description	gpd/Ac	gpd/du
RHD	Residential High Density	4,000	160
RMD	Residential Medium Density	3,230	190
RLD - CPE, OT	Residential Low Density - College Park East, Old Town	1,825	225
RLD - MH	Residential Low Density - Marina Hill	1,550	225
RLD - HR	Residential Low Density - Hellman Ranch	765	300

City of Seal Beach

Summary of Sewer Analysis for Potential Development Areas (September 2022)

1. Loads and Model Notes
    a. High Density Residential Unit flow Factor = 160 gpd/du
    (per City's 2018 Sewer Master Plan, Table 3-1)
    b. Potential sewage loads for each development area are shown in Table 1.
    c. Peaking Formula (per City's 2018 Sewer Master Plan, Section 3-3)

        Qpdw = 1.85 x Qadw 0.92+dry weather infiltration

        Where, Qpdw = Peak dry weather flow in cfs

        Qadw = Average dry weather flow in cfs

        Qpww =1.35 x Qpdw

        Where, Qpdw = Peak dry weather flow in cfs

        Qpww = Peak wet weather flow in cfs

    d. Depth to Diameter criteria (per City's 2018 Sewer Master Plan, Section 3-5.2)
        i. PDWF d/D < 0.50 for 15-inch and smaller pipes
        ii. PDWF d/D < 0.64 for 18-inch and larger pipes

2. Hydraulic Analysis Results
    a. Site B-2, B-4, B-5, B-9, B-10, B-11, and B-12

    The potential sewage loads, summarized in Table 1, were added to the sewer hydraulic model. The capacities of the sewers downstream of Site B-2, B-4, B-5, B-9, B-10, B-11, and B-12 were found to be sufficient to convey the anticipated peak dry weather flows.

    b. Site B-8, Sunset Aquatic Marina

    The potential sewage generated by the Sunset Aquatic Marina development (144 du) is anticipated to be conveyed to the Aquatic Park Lift Station. The Sunset Aquatic Marina is anticipated to generate an average sewage load of 24,040 gpd or 16 gpm (See Table 1).

    The existing average flow to the station is 1.6 gpm. Therefore the total flow would be 17.6 gpm. The associated peak dry weather flow and peak wet weather flow is 42 and 57 gpm, respectively using the aforementioned peaking formulas.

    The Aquatic Park Lift Station currently has two 30 gpm pumps. The City's criteria is that a pump station should consist of pumps that can handle the peak flows of the station. With the addition of the Sunset Aquatic Marina development, the current pumps would be undersized.

It is recommended that the Aquatic Park Lift Station capacity be re-evlauated when the Sunset Aquatic Marina development plans are more solidified. It is likely that the lift station will need to be upgraded or reconstructed. The lift station was on the Capital Improvement Project list (CIP 12) for replacement in the City's 2018 Sewer Master Plan at a cost of $1.4M.

c. Site WE-1, West Ed development

The West Ed development (246 du) loads were added at Manhole B15-M04 at the intersection of Lampson Avenue and Rose Street. There are sewers downstream of this location that the model predicts to flow at a PDWF d/D > 0.50 (see Table 2).

The two areas of concern are as follows:

1. 1,386 feet of 8-inch diameter pipe in Fir Avenue and Heather Street

   Existing Conditions, PDWF d/D ranges from 0.48 to 0.52

   With West Ed, PDWF d/D ranges from 0.56 to 0.61

2. 2,820 feet of 15-inch diameter pipe in Lampson Avenue

   Existing Conditions, PDWF d/D ranges from 0.53 to 0.57

   With West Ed, PDWF d/D ranges from 0.54 to 0.58

When the system was analyzed for the 2018 Sewer Master Plan project, recommendations for upsizing pipes was not made unless the PDWF d/D ratio exceeded 0.64. This was due to the fact that the sewers were already constructed and the land was assumed to be generally built out in the City.

As seen in Table 2, the d/D ratio in the 15-inch sewer in Lampson Avenue increases by 0.01 to 0.02 in each of the reaches. It is not a significant increase due to the larger pipe size. It is recommended that this pipe be flow monitored to verify the flow depths estimated in the model.

The d/D ratio in the 8-inch sewer in Fir Avenue and Rose Street increases by 0.08 to 0.10 in each of the reaches. The increase is more significant due to the smaller pipe size.

It is recommended that these pipes be flow monitored to verify the flow depths estimated in the model. If the depths are verified, it is recommended that the City require the developer to increase the 8" pipe in Fir Avenue and Rose Street to 12-inches in diameter to accommodate the anticipated sewage loads of the West Ed development.

MEMORANDUM

DATE: August 26, 2024

TO: Nicole Morse, Principal/Vice President, T&B Planning, Inc.

FROM: Casey Tibbet, MA, Associate/Architectural Historian

SUBJECT: Historic Research for the Property at 4665 Lampson Avenue in Los Alamitos, Orange County, California (LSA Project Number 20241902)

In June 2024, public comments were received as part of the public review process for a draft Environmental Impact Report (EIR) for a project at 4665 Lampson Avenue (Assessor's Parcel Number 130-012-35) in Los Alamitos, California. One commentor stated that she had "reason to believe" that three redwood trees located on the property are Moon Trees (Campbell 2024). Moon Trees were grown from seeds taken into space as part of the Apollo 14 moon landing mission in 1971 (see below for more detail). According to the commentor, "Fish and Game controlled where these seedlings were planted and Fish and Game was located at that building [4665 Lampson], so it is conceivable that they planted them; those trees are approximately 50+ years old which fits in with the age of those seedlings and should not be cut down" (Campbell 2024). The commentor also stated that there were originally five redwood trees, but two have died and one of the remaining three is not doing well.

In response to this comment, T&B Planning, Inc. retained LSA to conduct research to determine if the redwood trees located at the southwest corner of the property at 4665 Lampson Avenue are Moon Trees.

Background

The following history of the Moon Trees was compiled from information written by Dr. David R. Williams, Author/Curator, NASA Goddard Space Flight Center (Williams 2022, 2023 and 2024).

Copies of the original documents held at the United States Forest Service (USFS) Institute of Forest Genetics (IFG) western station in Placerville, California, reveal that the Moon Tree coast redwood (Sequoia sempervirens) seeds were collected in 1966 east of Soquel, California (near 37.00 N, 121.83 W, at an elevation of 1200 ft.) by Carl Fowler. The seeds were logged in and stored at the IFG station in Placerville, California, as Lot X. On January 15, 1971, 500 of the seeds from Lot X were sent to Dr. Charles Walkinshaw who was with the United States Department of Agriculture on special assignment with the National Aeronautics and Space Administration (NASA). Dr. Walkinshaw was also sent seeds from Douglas fir, sycamore, loblolly pine, and sweetgum trees. The seeds were packaged and carried by astronaut Stuart Roosa on the Apollo 14 moon landing flight and returned to Earth. The seeds were not taken to the moon surface, they remained in the command module.

1500 Iowa Avenue, Suite 200, Riverside, California 92507 951.781.9310 www.lsa.net

After their return (February 9, 1971), many of the seeds were grown in cellulose thimbles in Houston under controlled conditions supervised by Dr. Walkinshaw. On May 20, 1971, a request was made to promptly relocate the seeds to the IFG facilities in Placerville, California, and Gulfport, Mississippi since Houston did not have the necessary facilities to care for them. However, this did not occur and by July 10, 1972, the majority of the seedlings failed to survive. The remaining coast redwood and Douglas fir seeds were received by the IFG western station in Placerville on July 25, 1972. The sycamore, loblolly pine, and sweetgum seeds were sent to the IFG southern station in Mississippi.

The seeds sent to Placerville were logged as Lot AI and included 150 coast redwood seeds of which 20 successfully germinated. This is considered a normal germination rate for coast redwoods. They were transferred into containers in October 1972 at which time they ranged from 3 to 8 centimeters (approximately 1.2 to 3.1 inches) in height. In November 1972, there were 37 Douglas fir seedlings with an average height of 40.5 cm (about 16 inches). By December 1972, 16 of the redwood seedlings were still alive at an average height of 55.3 cm (approximately 22 inches). This is considered a normal mortality rate for redwoods. The redwood seedlings were numbered 1 to 16 on November 25, 1974. On January 3 and February 28, 1975, at the request of Stan Krugman, cuttings were taken and rooted, these were logged as Lot AJ. The plan was to have enough cuttings to give to the states for the bicentennial in 1976. Records indicate that 93 redwood root cuttings and 35 Douglas fir cuttings survived as of September 1976. On May 16, 1975, a letter was sent from the USFS to all state foresters advising them of the availability of the Moon Tree seedlings. Only two states (Main and Minnesota) did not request any Moon Trees (Johnson 1976).

In 1976, all but 1 of the 16 redwood seedlings from Lot AI were distributed (12 to California and 3 to Virginia). On April 2, 1976, nine redwood seedlings from Lot AI (numbers 6, 7, 9, 10, 12, 13, 14, 15, and 16), along with two root cuttings from Lot AJ, were sent to California State Forester Ron Adams to be planted at various locations in California for the bicentennial. On April 26, 1976, three redwood seedlings (numbers 4, 5, and 8) were sent to Virginia to the Chief Nurseryman at Yorktown Victory Center. On May 2, 1976, three redwood seedlings (numbers 1, 2, and 3) were released to the director of the Pacific Southwest Station in Arcata, California, for a dedication planting. [These are assumed to be the three redwoods planted next to the Theater Arts building at California State Polytechnic University, Humboldt (Cal Poly Humboldt 2009).] As of September 20, 1976, one redwood seedling (number 11) was being kept “on-hand” at the Placerville station.

An April 2, 1976, letter from the California State Forester to the USFS, listed locations for 12 of the Moon Trees. One tree was going to Capitol Park in Sacramento and 9 were going to various colleges and universities in northern California. Only two trees were slated for southern California for a “USFS-CDF [California Division of Forestry] ceremony”. The specific location for these two trees was not specified.

Aside from the 2 root cuttings given to the California State Forester, the disposition of the 93 root cuttings (Lot AJ) is unknown. However, in a 2009 article, Bob Sise, a retired forestry professor at California State Polytechnic University at Humboldt (HSU), stated that somehow “hundreds” of

moon trees ended up in the HSU greenhouse (Cal Poly Humboldt 2009). It is not clear if all of them were redwoods, but according to Sise, they are planted all over the HSU campus and are indistinguishable from "traditional redwoods and trees of other species" (Ibid.). He noted that three redwood moon trees are planted alongside the Theater Arts building and used to have a plaque identifying them as moon trees. However, students kept stealing the plaque so eventually the school gave up on it (ibid.). As previously stated, these three trees are assumed to be the three released to the director of the Pacific Southwest Station in Arcata for a dedication planting.

As noted by Mr. Sise, aside from the lack of records, a complicating factor in the identification of the redwood "moon trees" is that there is no apparent difference between the trees grown from the original seedlings (Lot AI), the root cuttings (Lot AJ), or redwoods that have not traveled into deep space.

Current Research

Methodology

To determine if the redwood trees located at the southwest corner of 4665 Lampson Avenue are or are likely to be Moon Trees, LSA conducted online searches including an extensive search of California news articles using newspapers.com. In addition, the following were contacted:

- NASA archivist, Davd Williams;
- National Forest Genetics Laboratory (Placerville, CA), Amaldo Ferreira, Jessica Wright, and Andrew Groover
- USFS staff in the Angeles, Cleveland, San Bernardino, and Six Rivers National Forests
- State Urban Forester, Walter Passmore
- California Department of Fish and Wildlife (South Coast Region), Steve Gibson
- City of Los Alamitos, Tom Oliver (Planning), Emeline Noda (Recreation and Community Services), and Ron Noda (Deputy City Manager)
- Gardens of Golden Gate Park
- Orange County Archives
- Los Alamitos Public Library
- Los Alamitos Museum, Marilynn Poe
- Santa Ana Public Library, History Room

To date, responses have not been received from: Mr. Passmore, State Urban Forester; Emeline Noda, Recreation and Community Services; Andrew Groover, National Forest Genetics Laboratory; Six Rivers National Forest staff; or the Los Alamitos Public Library, which is closed until further notice.

Results

The following summarizes the information obtained through research and from each group and individual contacted.

Newspaper Research. Extensive online searches of newspapers throughout California were conducted. A number of articles related to Moon Trees were found, but none mentioned any Moon Trees at 4665 Lampson Avenue or even in Orange County. No record was found for a joint USFS/CDF ceremony in southern California in the mid-1970s. No connection between the Moon Trees and CDFW was found. No information about the Los Alamitos bicentennial celebration was found in Google searches or a search of *The Register* for the month of July 1976.

NASA. The information provided by NASA is the most comprehensive. It clearly states that the Moon Tree project was a NASA/USFS project and that the seedlings were distributed to the California Department of Forestry. There is no mention of CDFW (or CDFG as it was previously known). Although they do not have the planting locations for the two redwood Moon Tree seedlings that were sent to southern California in 1976 or the remainder of the 93 redwood root cuttings, NASA has not located any Moon Trees from the Apollo 14 mission in Orange County, California.

National Forest Genetics Laboratory. Staff from the laboratory indicated they would look for records for the Apollo 14 seedlings, but were not optimistic about finding information beyond what NASA already provided. Ms. Wright noted she is currently working on the Artemis 1 moon tree seedlings and will make sure to keep better records. No additional information has been received from the laboratory staff.

USFS. To date, none of the USFS staff contacted in the Angeles, Cleveland, San Bernardino, and Six Rivers National Forests have found any information about the Apollo 14 Moon Trees.

State Urban Forester. Walter Passmore did not respond.

California Department of Fish and Wildlife (CDFW). According to Steve Gibson, CDFW South Coast Region, because CDFW only leased the building at 4665 Lampson Avenue in Los Alamitos, they would not have been allowed to plant any trees on the property. Mr. Gibson reported that he discussed this with several colleagues who agreed with that statement. Furthermore, although Mr. Gibson could not confirm it, research indicates that the CDFW was at that location from 2002 to 2023, which does not fit the timeframe for the Apollo 14 Moon Tree plantings.

City of Los Alamitos. Tom Oliver was asked about the CDFW lease dates, but did not have that information. Emeline Noda was suggested by Marilynn Poe (Los Alamitos Museum) as someone who might have information about the city's bicentennial celebration and whether any trees were planted. Ms. Noda responded that no redwood trees were planted as part of the city's 50th anniversary celebration. She referred LSA's inquiry to Ron Noda who replied that according to their database there are no Moon Trees in the city.

Gardens of Golden Gate Park. Ryan Guillou, Director of Collections and Conservation, responded that the gardens did have a Moon Tree, but because of lapses in record keeping he could not provide any details.

Orange County Archives. Susan Berumen, Archivist, responded that they have no information on the planting of the Moon Trees.

Los Alamitos Public Library. Automatic reply stated that the library is closed until further notice.

Los Alamitos Museum. Marilynn Poe responded that she attended the bicentennial celebration in Los Alamitos and does not remember any Moon Trees being planted. Online research revealed that Ms. Poe is a longtime Los Alamitos resident, an active community volunteer, and has also been active in local government. She was Mayor of Los Alamitos in 1999, 2003, and 2010. Ms. Poe suggested that LSA contact Emeline Noda with the City of Los Alamitos to see if she has any additional information regarding Moon Trees. As indicated above, Ms. Noda has not responded.

Santa Ana Public Library, History Room. Staff responded via voice message that the library is closed for renovations for the next two years. They suggested obtaining a library card to facilitate online research using their resources.

Conclusion

Research found no evidence that the redwood trees at 4665 Lampson Avenue are Moon Trees. Neither NASA nor the USFS has found any record of the Apollo 14 Moon Trees being planted in Orange County. CDFW was not part of the 1970s Moon Tree program and was not responsible for distributing Moon Tree seedlings. CDFW staff think it unlikely they would have been allowed to plant trees at the Lampson Avenue location since they only leased the building. Additionally, it appears the CDFW lease was several decades after the mid-1970s timeframe when the trees would most likely have been planted and therefore the commentor's speculation that "it is conceivable [CDFW] planted them" is unlikely to be accurate. Moreover, according to City records, there are no Moon Trees in Los Alamitos. In addition, none of the other sources that responded to requests for information could confirm that the redwood trees at 4665 Lampson Avenue are Moon Trees or even that any Moon Trees were planted in Orange County.

As such, based on the research conducted to date, the redwood trees located on the southwest corner of the property at 4665 Lampson Avenue in Los Alamitos, do not appear to be Moon Trees associated with the 1971 Apollo 14 moon landing mission.

September 2024

CEQA Requirements

The California Environmental Quality Act (CEQA) requires that when a public agency completes an environmental document that includes measures to mitigate or avoid significant environmental effects, the public agency must adopt a Mitigation Monitoring and Reporting Program (MMRP) for the changes to the project that it has adopted or made a condition of project approval in order to mitigate or avoid significant environmental impacts. The appropriate reporting or monitoring plan must be designed to ensure compliance during project implementation (Public Resources Code §21081.6; 14 Cal. Code Regs. §15091(d)).

The City of Los Alamitos will coordinate the monitoring of the mitigation measures and regulatory requirements with each applicable City department or division, while various City departments/divisions would be responsible for monitoring and verifying compliance of specific mitigation measures and regulatory requirements (see the beginning on page 3). Monitoring will include: 1) verification that each mitigation measure and regulatory requirement has been implemented; 2) recordation of the actions taken to implement each mitigation measure and regulatory requirement; and 3) retention of records in the project file.

Project Objectives

The objectives of the proposed 4665 Lampson Avenue (the "Project") include the following:

1. Provide residential development consistent with the City's General Plan, including the 20212029 Housing Element, to help meet the City's RHNA requirement.
2. Provide a variety of housing types and affordability (for lower income and above moderate income households) that satisfies the residential market and accommodates increased demand for housing.
3. Provide a variety of affordable housing types to support middle-income workers, providing an opportunity for residents to live closer to where they work.
4. Improve the City's jobs housing balance to support reduced commute distances consistent with the Southern California Association of Governments' Connect SoCal.
5. Create a residential character that provides for a high quality architectural design.

Overview of the Project

The Project Applicant, Lampson Park Place, LLC, is seeking approval of a Site Development Permit – Major, Tentative Parcel Map 2022-133 (for Finance and Conveyance Purposes), Vesting Tentative Tract Map No. 19263 (for Condominium Purposes), and an Affordable Housing Unit Application for Density Bonus and/or Incentives or Concessions to redevelop the Project site with 246 residential units (the "Project"). Refer to EIR Section 3.0, *Project Description*, of the Draft EIR for a detailed description of the Project.

Mitigation Monitoring and Reporting Plan

This MMRP delegates responsibilities for monitoring the implementation of the 4665 Lampson Avenue Project mitigation measures and applicable regulatory requirements and allows responsible City entities flexibility and discretion in determining how best to monitor implementation. Monitoring procedures will vary according to the type of mitigation measure or regulatory requirement. The timing for monitoring and reporting is described in the monitoring and reporting summary table, below. Adequate monitoring requires demonstration of monitoring procedures and implementation of mitigation measures and regulatory requirements.

Additionally, Project Design Features (PDFs) are included in the Project's MMRP to further ensure the implementation of the PDFs. "Project design features" refer to avoidance and minimization measures or environmental commitments that have been incorporated into the project design as part of the project description, and the use of these project design features is contemplated pursuant to CEQA Guidelines Sections 15064(f)(2) and 15126.4(a)(1)(A). Project design features incorporated into the project design to avoid or minimize environmental impacts should be distinguished from proposed mitigation. (CEQA Guidelines Section 15126.4(a)(1)(A)) This MMRP distinguishes between PDFs and Mitigation Measures, which are identified in CEQA Guidelines Section 15126.4(a)(1) as "feasible measures which could minimize significant adverse impacts."

In order to enhance the effectiveness of the monitoring program, the City will utilize existing systems where appropriate. These inspectors are familiar with a broad range of regulatory issues and will provide first line oversight for much of the monitoring program during construction activities.

Program Changes

If changes are required to this MMRP, they will be made in accordance with CEQA and applicable provisions of the City's Municipal Code. Such changes could include reassignment of monitoring and reporting responsibilities and/or modifications to mitigation measures that achieve the same or better end results. No change will be permitted unless the Mitigation Monitoring and Reporting Program continues to satisfy the requirements of Public Resources Code §21081.6.

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
4.1 Aesthetics						
Summary of Impacts						
Threshold a: Would the Project have a substantial adverse effect on a scenic vista?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold b: Would the Project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	N/A	No mitigation is required.	N/A	N/A	N/A	No Impact
Threshold c: In non-urbanized areas, would the Project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold d: Would the Project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
4.2 Air Quality						
Summary of Impacts						
Threshold a: Would the Project conflict with or obstruct implementation of the applicable air quality plan?	PDF AQ-1 The Project will utilize Tier 4 Interim construction equipment during construction activities.	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold b: Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	PDF AQ-1 shall apply	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold c: Would the Project expose sensitive receptors to substantial pollutant concentrations?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold d: Would the Project result in other emissions (such as those leading to	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
odors) adversely affecting a substantial number of people?						
4.3 Biological Resources						
Summary of Impacts						
Threshold a: Would the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	PDF B-1 Pursuant to Figure 3-18, Landscape Plan, the Project will incorporate larger sized box tree species (including the western sycamore and cottonwood trees) that foliage specialist bats prefer and will plant the trees on the fringes of the development, adjacent to open space areas. PDF B-2 Pursuant to Figure 3-18, Landscape Plan, the Project will plant approximately 441 trees onsite (excluding shrubs and ground cover), including the western sycamore (*Platanus racemosa*), paperbark melaleuca (*Melaleuca quinquenervia*), olive (*Olive sp.*), southern magnolia (*Magnolia grandiflora*), Crape myrtle (*Lagerstroemia indica*), Brisbane box *(Lophostemon confertus*), Australian willow (*Geijera parviflora*), Italian cypress (*Cupressus sempervirens*), yew pine (*Podocarpus macrophyllus*) and other species. No plants listed on the California Invasive Plant Council (Cal-IPC) Inventory species will be planted and a list of approved species to planted shall be reviewed by a qualified biologist prior to planting.	**MM 4.3-1** Vegetation clearing should be conducted outside of the nesting season (February 1 through September 15). If avoidance of the nesting season is not feasible, then a qualified biologist shall conduct a pre-construction nesting bird survey within three days prior to any disturbance to the Project site. Site disturbance includes disking, demolition activities, vegetation removal and grading. If active nests are identified, the biologist shall establish appropriate avoidance buffers around the nest (based on the species detected), and the buffer areas shall be avoided until the nests are no longer occupied (through routine nest monitoring by the qualified biologist) and the juvenile birds can survive independently from their nest(s). In addition, if portions of the Project site have not been disturbed within three days after the initial nesting bird survey, additional nesting bird surveys will be conducted (within the nesting bird season, February 1 to September 15) until all portions of the Project site have been disturbed appropriately (as determined by a qualified biologist) as to not provide potential nesting habitat.	Project Applicant	City of Los Alamitos Planning Department, Project Biologist	Prior to construction activities	Less-than-Significant Impact with Mitigation Incorporated
		MM 4.3-2 If tree removal or ground disturbance occurs during the raptor nesting season (from approximately January 1 to July 31), pre-removal/disturbance surveys shall be conducted. The surveys shall include areas of suitable nesting trees within	Project Applicant	City of Los Alamitos Planning Department, Project Biologist	Prior to construction activities	

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
		300-feet from the limits of disturbance (to the extent that access is available). The survey shall be conducted no more than three days prior to disturbance. Should nesting raptors be detected either onsite or offsite, work would be delayed until fledglings have left the nest and area no longer dependent on the nest at which time, work could proceed.				
		MM 4.3-3 A qualified biologist shall conduct a pre-construction bat roost survey for roosting bats no more than 14 days prior to site disturbance. The pre-construction bat roost survey will consist of a minimum of two bat surveys (conducted consecutively or as determined by the biologist). If roosting bats are detected onsite outside of the bat maternity season, the roost tree will be removed in a manner to avoid and/or minimize injury to roosting bats. This may include using mechanical equipment to gently nudge the tree trunk multiple times prior to removal or for palm trees and other species, to de-frond or de-branch the tree using a mechanical lift and gently lower the cut branches to the ground. Regardless of the method, the fallen tree and/or material will be left undisturbed overnight until at least the next morning to give roosting bats time to exit before site disturbance. If roosting bats are detected onsite during the maternity season, the Project shall avoid the subject roost(s) and incorporate an avoidance buffer (as determined by a qualified biologist) until after the maternity season or until a qualified biologist	Project Applicant	City of Los Alamitos Planning Department, Project Biologist	Prior to construction activities	

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
		determines no maternity roosting is occurring. Once the qualified biologist approves removal of the subject roost tree(s), the same tree removal procedures as outlined above shall be implemented prior to tree removal.				
Threshold b: Would the Project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?	N/A	No mitigation is required.	N/A	N/A	N/A	No Impact
Threshold c: Would the Project have substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	N/A	No mitigation is required.	N/A	N/A	N/A	No Impact
Threshold d: Would the Project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	N/A	MM 4.3-1 would apply.	Refer to MM 4.3-1 above.	Refer to MM 4.3-1 above.	Refer to MM 4.3-1 above.	Less-than-Significant Impact with Mitigation Incorporated
Threshold e: Would the Project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	N/A	No mitigation is required.	N/A	N/A	N/A	No Impact
Threshold f: Would the Project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	N/A	No mitigation is required.	N/A	N/A	N/A	No Impact
4.4 Cultural Resources						
Summary of Impacts						
Threshold a: Would the Project cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5?	N/A	No mitigation is required.	N/A	N/A	N/A	No Impact
Threshold b: Would the Project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?	N/A	**MM 4.4-1** Discovery of Inadvertent Resources. Prior to the issuance of any grading permits, the Project Applicant/Developer shall submit	Project Applicant	City of Los Alamitos Planning Department, Project Archaeologist	Prior to the issuance of grading permit and monitoring during construction.	Less-than-Significant Impact with Mitigation Incorporated

Threshold	Project Design Features (PDF)	Mitigation Measures (MMs)	Responsible Party	Monitoring Party	Implementation Stage	Level of Significance
		proof that a qualified consulting archaeologist meeting the Secretary of Interior's (36 CFR 61) Professional Qualifications Standards has been retained to conduct periodic spot checks during ground disturbing activities. Spot check should occur at initial ground exposure within the project; upon a 50 percent completion milestone of ground disturbance; upon an 80 percent milestone of ground disturbance; or at any other time determined necessary by the consulting archaeologist. If any potentially historic or archaeological resources are encountered during ground-disturbing activities, the archaeologist shall halt construction work within 50 feet of the find and assess the nature of the find for importance. a) If the discovery is determined to not be important by the archaeologist (e.g. isolates and clearly non-significant deposits), work will be permitted to continue in the area. If a find is determined to be potentially important by the archaeologist, the Lead Agency shall be notified, and additional investigation would be required. Additional investigation work would include scientific recordation and, depending on the nature of the find, excavation. b) At the conclusion of ground disturbing activities, the archaeologist shall draft a report detailing the monitoring process and summarize any additional field study and analysis of resources, should any be discovered. The completed report shall be approved by the Planning				

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
		Department and the Project Applicant/Developer shall provide verification that the report was submitted to the Lead Agency prior to the issuance of an occupancy permit. c) Excavated finds shall be curated at a repository determined by the archaeologist and approved by the City with verification provided to the City prior to the issuance of an occupancy permit.				
Threshold c: Would the Project disturb any human remains, including those interred outside of formal cemeteries?	N/A	**MM 4.4-2** Discovery of Human Remains. If human burial or skeletal remains are identified during excavation or construction, work in that location shall stop immediately until the find can be properly treated. The construction contractor would be required by law to comply with California Health and Safety Code Section 7050.5 "Disturbance of Human Remains." The County Coroner must be contacted and if the Coroner recognizes the human remains to be those of a Native American or has reason to believe that they are those of a Native American, the Coroner is required to contact the Native American Heritage Commission (NAHC) by telephone within 24 hours. Once the NAHC receives notification of a discovery of Native American human remains from a county coroner, the NAHC is required to immediately notify those persons it believes to be most likely descended from the deceased Native American. The descendants may, with the permission of the owner of the land, or his or her authorized representative, inspect the Site of the discovery of the Native American human remains and may recommend	Project Applicant	City of Los Alamitos Planning Department, Project Archaeologist	Monitoring during grading activities	Less-than-Significant Impact with Mitigation Incorporated

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
		to the owner or the person responsible for the excavation work means for treatment or disposition, with appropriate dignity, of the human remains and any associated grave goods. The descendants shall complete their inspection and make recommendations or preferences for treatment within 48 hours of being granted access to the site. According to Public Resources Code Section 5097.94(k), the NAHC is authorized to mediate disputes arising between landowners and known descendants relating to the treatment and disposition of Native American human burials, skeletal remains, and items associated with Native American burials.				
4.5 Energy						
Summary of Impacts						
Threshold a: Would the Project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	PDF GHG-1 The Project will include solar photovoltaic panels with the capability to generate up to 1,229,520 kWh/annually. PDF GHG-2 The Project will be 100% electric and will not include natural gas. PDF GHG-3 The Project will provide a community electric vehicle for the affordable housing component for residents to drive short distance trips to the local grocery store. PDF GHG-4 The Project's parking areas will be designed to provide electric vehicle (EV) charging stations. At minimum, the number of EV charging stations will equal the Tier 2 Residential Voluntary Measures	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
	of the California Green Building Standards Code, Section A4.106.8.2.1.					
Threshold b: Would the Project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	PDF GHG-1 through GHG-4 shall apply.	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
4.6 Geology and Soils						
Summary of Impacts						
Threshold a: Would the Project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42; strong seismic ground shaking; seismic-related ground failure, including liquefaction; landslides?	N/A	**MM 4.6-1** Prior to the issuance of grading permits or building permits, the City of Los Alamitos Public Works & Engineering Department shall verify that all of the recommendations provided in Section 4.0 of the Project's December 21, 2021 "Preliminary Geotechnical Evaluation and Design Recommendations for Proposed Single-Family and Multi-Family Residential Development, 4665 Lampson Avenue, Los Alamitos, California," prepared by LGC Geotechnical, Inc. and included as Technical Appendix F1 to the Project's EIR, are incorporated into the Project's grading and building plans and implemented by the construction contractors. These recommendations include but are not limited to a) Site Earthwork Considerations; b) Preliminary Foundation Recommendations; c) Site Grading Recommendations; d) Soil Bearing and Lateral Resistance Considerations; e) Lateral Earth Pressures for Retaining Walls Considerations; f) Nonstructural Concrete Flatwork Recommendations; and g) Preliminary Asphalt Concrete Pavement Design Parameters. Alternatively, the Project shall comply with the findings and	Project Applicant	City of Los Alamitos Public Works & Engineering Department	Prior to issuance of grading permits	Less-than-Significant Impact with Mitigation Incorporated

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
		recommendations of any geotechnical studies that may be required in association with future grading and/or building permits.				
Threshold b: Would the Project result in substantial soil erosion or the loss of topsoil?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold c: Would the Project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	N/A	MM 4.6-1 would apply.	Refer to MM 4.6-1 above.	Refer to MM 4.6-1 above.	Refer to MM 4.6-1 above.	Less-than-Significant Impact with Mitigation Incorporated
Threshold d: Would the Project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	N/A	MM 4.6-1 would apply.	Refer to MM 4.6-1 above.	Refer to MM 4.6-1 above.	Refer to MM 4.6-1 above.	Less-than-Significant Impact with Mitigation Incorporated
Threshold e: Would the Project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	N/A	No mitigation is required.	N/A	N/A	N/A	No Impact
Threshold f: Would the Project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	N/A	**MM 4.6-2** If paleontological resources are discovered during earth disturbance activities, the discovery shall be cordoned off with a 50-foot radius buffer so as to protect the discovery from further potential damage, and an Orange County Certified Professional Paleontologist shall be consulted to assess the discovery. If the discovery is determined to be significant by the paleontologist, a monitoring and recovery plan shall be initiated, which will include notification of appropriate personnel involved and monitoring of earth disturbance activities. a) Monitoring of mass grading and excavation activities shall be	Project Applicant	City of Los Alamitos Planning Department, Project Paleontologist	Monitoring during grading activities	Less-than-Significant Impact with Mitigation Incorporated

Threshold	Project Design Features (PDF)	Mitigation Measures (MMs)	Responsible Party	Monitoring Party	Implementation Stage	Level of Significance
		performed by a qualified paleontologist or paleontological monitor. Monitoring will be conducted full-time in areas of grading or excavation in undisturbed sediments of alluvial deposits. b) Paleontological monitors will be equipped to salvage fossils as they are unearthed to avoid construction delays. The monitor must be empowered to temporarily halt or divert equipment to allow removal of fossils in a timely manner. Monitoring may be reduced if the potentially fossiliferous units are not present in the subsurface, or, if present, are determined upon exposure and examination by qualified paleontological personnel to have low potential to contain fossil resources. The monitor shall notify the project paleontologist, who will then notify the concerned parties of the discovery. c) Paleontological salvage during trenching and boring activities is typically from the generated spoils and does not delay the trenching or drilling activities. Fossils will be collected and placed in cardboard flats or plastic buckets and identified by field number, collector, and date collected. Notes will be taken on the map location and stratigraphy of the site, which is photographed before it is vacated and the fossils are removed to a safe place. If the site involves remains from a large terrestrial vertebrate, such as large bone(s) or a mammoth tusk, that is/are too large to be easily removed by a single monitor, a fossil recovery crew shall excavate around the find, encase the find within a plaster and burlap jacket, and				

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
		remove it after the plaster is set. For large fossils, use of the contractor's construction equipment may be solicited to help remove the jacket to a safe location. d) Recovered specimens will be prepared to a point of identification and permanent preservation (not display), including screen-washing sediments to recover small invertebrates and vertebrates. e) Recovered specimens shall be identified and curated of specimens into a professional, accredited public museum repository with a commitment to archival conservation and permanent retrievable storage (e.g., OC Parks). The paleontological program should include a written repository agreement prior to the initiation of monitoring activities. Prior to curation, the lead agency (e.g., the City of Los Alamitos) will be consulted on the repository/museum to receive the fossil material. f) A final report of findings and significance will be prepared, including lists of all fossils recovered and necessary maps and graphics to accurately record their original location(s). The report, when submitted to, and accepted by, the appropriate lead agency, will signify satisfactory completion of the project program to reduce impacts to any potential nonrenewable paleontological resources (i.e., fossils) that might have been lost or otherwise adversely affected without such a program in place.				

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
4.7 Greenhouse Gas Emissions						
Summary of Impacts						
Threshold a: Would the Project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	PDF GHG-1 through GHG-4 shall apply.	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold b: Would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	PDFs GHG-1 through GHG-4 shall apply.	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
4.8 Hazards and Hazardous Materials						
Summary of Impacts						
Threshold a: Would the Project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold b: Would the Project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold c: Would the Project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	N/A	No mitigation is required.	N/A	N/A	N/A	No Impact
Threshold d: Would the Project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	N/A	No mitigation is required.	N/A	N/A	N/A	No Impact
Threshold e: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project result in a safety hazard or excessive noise for people residing or working in the project area?	PDF N-2 shall apply	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold f: Would the Project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
Threshold g: Would the Project expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?	N/A	No mitigation is required.	N/A	N/A	N/A	No Impact
4.9 Hydrology and Water Quality						
Summary of Impacts						
Threshold a: Would the Project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold b: Would the Project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold c: Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: result in substantial erosion or siltation on- or off-site; substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite; create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flood flows?	PDF HYD-1 The Project will be built such that the finished floor elevation for the onsite buildings is set 1 foot minimum above the peak 100-year storm event water surface elevation in accordance with Orange County Flood Protection Requirements	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold d: Would the Project in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	PDF HYD-1 shall apply.	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold e: Would the Project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
4.10 Land Use Planning						
Summary of Impacts						
Threshold a: Would the Project physically divide an established community?	N/A	No mitigation is required.	N/A	N/A	N/A	No Impact

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
Threshold b: Would the Project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
4.11 Noise						
Summary of Impacts						
Threshold a: Would the Project generate substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	PDF N-1 Prior to the issuance of occupancy permits, the Project will construct a 7-foot-high noise barrier along Lampson Avenue. The noise control barrier will be constructed so that the top of each wall and /or berm combination extends to the planned height above the pad elevation of the lot it is shielding. Since the pad elevations varies, the top of each wall and/or berm combination will be 7' above each applicable pad elevation. When the roadway or terrain is elevated above the pad elevation, the barrier shall extend to the recommended height above the highest point between the residential home and the roadway. The barrier shall be built with a material surface weight of at least 4 pounds per square foot, with no decorative cutouts, perforations, or line-of-sight openings between residences and Lampson Avenue. The noise barrier shall be constructed using the following materials: • Masonry block; • Stucco veneer over wood framing (or foam core), or 1-inch-thick tongue and	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
	groove wood of at least four pounds per square foot; • Material with sufficient weight per square foot capable of providing a minimum transmission loss of 20 dBA; • Earthen berm; or, • Any combination of these construction materials					
Threshold b: Would the Project generate excessive groundborne vibration or groundborne noise levels?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold c: For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project expose people residing or working in the project area to excessive noise levels?	To comply with the State of California and City of Los Alamitos 45 A-weighted Decibels (dBA) Community Noise Equivalent Level (CNEL) interior noise standards for residential land use, the Project will provide the following or equivalent noise abatement measures on building plans: • Windows & Glass Doors: At a minimum the Project will provide windows and glass doors that are well-fitted, well-weather-stripped assemblies with minimum sound transmission class (STC) ratings of 27. Additionally, all second floor facades adjacent to Lampson Avenue and JFTB Los Alamitos will be provided windows and glass doors that are well-fitted, well-weathers-tripped assemblies with minimum sound transmission class (STC) ratings of 29. • Doors (Non-Glass): All exterior doors shall be well weather-stripped and have	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
	Well-sealed perimeter gaps around the doors are essential to achieve the minimum STC rating. • Walls: At any penetrations of exterior walls by pipes, ducts, or conduits, the space between the wall and pipes, ducts, or conduits shall be caulked or filled with mortar to form an airtight seal. • Roof: Roof sheathing of wood construction shall be per manufacturer's specification or caulked plywood of at least one-half inch thick. Ceilings shall be per manufacturer's specification or well-sealed gypsum board of at least one-half inch thick. Insulation with at least a rating of R-19 shall be used in the attic space. • Ventilation: Arrangements for any habitable room shall be such that any exterior door or window can be kept closed when the room is in use and still receive circulated air. A forced air circulation system (e.g. air conditioning) or active ventilation system (e.g. fresh air supply) shall be provided in compliance with applicable State and local Building Codes (e.g. California Building Code, Chapter 3, R338.3).

4.15 Transportation						
Summary of Impacts						
Threshold a: Would the Project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold b: Would the Project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	N/A	**MM 4.15-1** Prior to the issuance of certificate of occupancy, the Project Applicant shall provide documentation that it has implemented the CAPCOA strategies identified below. Verification that the COPCOA strategies were completed shall be verified by the City's Public Works Director. 1. Provide pedestrian and bicycle network improvements within the development connecting to existing off-site facilities, as detailed in Section 3.3.2 of this EIR. 2. Confirm with the OCTA whether providing new or re-routing existing transit services to the site would be feasible, as determined by OCTA pursuant to OCTA's standards. 3. Install broadband infrastructure or other communication technologies that encourages telecommuting and working from home, which would reduce mobile source emission.	Project Applicant	City of Los Alamitos Public Works Department	Prior to issuance of certificate of occupancy	Significant and Unavoidable
Threshold c: Would the Project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact
Threshold d: Would the Project result in inadequate emergency access?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impact

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
4.16 Tribal Cultural Resources						
Summary of Impacts						
Threshold a: Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?	N/A	**MM 4.16-1** Retain a Native American Monitor Prior to Commencement of Ground-Disturbing Activities. 1. The project applicant/lead agency shall retain a Native American Monitor from or approved by the Gabrieleño Band of Mission Indians – Kizh Nation. The monitor shall be retained prior to the commencement of any "ground-disturbing activity" for the subject project at all project locations (i.e., both on-site and any off-site locations that are included in the project description/definition and/or required in connection with the project, such as public improvement work). "Ground disturbing activity" shall include, but is not limited to, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching. 2. A copy of the executed monitoring agreement shall be submitted to the lead agency prior to the earlier of the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence a ground-disturbing activity. 3. The monitor will complete daily monitoring logs that will provide descriptions of the relevant ground-disturbing activities, the type of construction activities performed, locations of ground disturbing activities, soil types, cultural-related materials, and any other facts,	Project Applicant	City of Los Alamitos Planning Department, Native American Monitor	Prior to issuance of grading permit and monitoring during grading activities	Less-than-Significant Impact with Mitigation Incorporated

Threshold	Project Design Features (PDF)	Mitigation Measures (MMs)	Responsible Party	Monitoring Party	Implementation Stage	Level of Significance
		conditions, materials, or discoveries of significance to the Tribe. Monitor logs will identify and describe any discovered TCRs, including but not limited to, Native American cultural and historical artifacts, remains, places of significance, etc., (collectively, tribal cultural resources, or "TCR"), as well as any discovered Native American (ancestral) human remains and burial goods. Copies of monitor logs will be provided to the project applicant/lead agency upon written request to the Tribe. 4. On-site tribal monitoring shall conclude upon the latter of the following (1) written confirmation to the Kizh from a designated point of contact for the project applicant/lead agency that all ground-disturbing activities and phases that may involve ground-disturbing activities on the project site or in connection with the project are complete; or (2) a determination and written notification by the Kizh to the project applicant/lead agency that no future, planned construction activity and/or development/construction phase at the project site possesses the potential to impact Kizh TCRs. 5. Upon discovery of any TCRs, all construction activities in the immediate vicinity of the discovery shall cease (i.e., not less than the surrounding 50 feet) and shall not resume until the discovered TCR has been fully assessed by the Kizh monitor and/or Kizh archaeologist. The Kizh will recover and retain all discovered TCRs in the form and/or manner the Tribe deems appropriate,				

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
		in the Tribe's sole discretion, and for any purpose the Tribe deems appropriate, including for educational, cultural and/or historic purposes.				
		MM 4.16-2 Unanticipated Discovery of Human Remains and Associated Funerary Object. 1. Native American human remains are defined in PRC 5097.98 (d)(1) as an inhumation or cremation, and in any state of decomposition or skeletal completeness. Funerary objects, called associated grave goods in Public Resources Code Section 5097.98, are also to be treated according to this statute. 2. If Native American human remains and/or grave goods discovered or recognized on the project site, then all construction activities shall immediately cease. Health and Safety Code Section 7050.5 dictates that any discoveries of human skeletal material shall be immediately reported to the County Coroner and all ground-disturbing activities shall immediately halt and shall remain halted until the coroner has determined the nature of the remains. If the coroner recognizes the human remains to be those of a Native American or has reason to believe they are Native American, he or she shall contact, by telephone within 24 hours, the Native American Heritage Commission, and Public Resources Code Section 5097.98 shall be followed. 3. Human remains and grave/burial goods shall be treated alike per	Project Applicant	City of Los Alamitos Planning Department, Native American Monitor	Prior to issuance of grading permit and monitoring during grading activities	Less-than-Significant Impact with Mitigation Incorporated

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
		California Public Resources Code section 5097.98(d)(1) and (2). 4. Construction activities may resume in other parts of the project site at a minimum of 200 feet away from discovered human remains and/or burial goods, if the Kizh determines in its sole discretion that resuming construction activities at that distance is acceptable and provides the project manager express consent of that determination (along with any other mitigation measures the Kizh monitor and/or archaeologist deems necessary). (CEQA Guidelines Section 15064.5(f).) 5. Preservation in place (i.e., avoidance) is the preferred manner of treatment for discovered human remains and/or burial goods. Any historic archaeological material that is not Native American in origin (non-TCR) shall be curated at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes. 6. Any discovery of human remains/burial goods shall be kept confidential to prevent further disturbance.				
		MM 4.16-3 Procedures for Burials and Funerary Remains.	Project Applicant	City of Los Alamitos Planning	Prior to issuance of grading permit and	Less-than-Significant Impact with Mitigation Incorporated

Threshold	Project Design Features (PDF)	Mitigation Measures (MMs)	Responsible Party	Monitoring Party	Implementation Stage	Level of Significance
		1. As the Most Likely Descendant ("MLD"), the Koo-nas-gna Burial Policy shall be implemented. To the Tribe, the term "human remains" encompasses more than human bones. In ancient as well as historic times, Tribal Traditions included, but were not limited to, the preparation of the soil for burial, the burial of funerary objects with the deceased, and the ceremonial burning of human remains. 2. If the discovery of human remains includes four or more burials, the discovery location shall be treated as a cemetery and a separate treatment plan shall be created. 3. The prepared soil and cremation soils are to be treated in the same manner as bone fragments that remain intact. Associated funerary objects are objects that, as part of the death rite or ceremony of a culture, are reasonably believed to have been placed with individual human remains either at the time of death or later; other items made exclusively for burial purposes or to contain human remains can also be considered as associated funerary objects. Cremations will either be removed in bulk or by means as necessary to ensure complete recovery of all sacred materials. 4. In the case where discovered human remains cannot be fully documented and recovered on the same day, the remains will be covered with muslin cloth and a steel plate that can be moved by heavy equipment placed over the excavation opening to protect the remains. If this type of steel plate		Department, Native American Monitor	monitoring during grading activities	

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
		is not available, a 24-hour guard should be posted outside of working hours. The Tribe will make every effort to recommend diverting the project and keeping the remains in situ and protected. If the project cannot be diverted, it may be determined that burials will be removed. 5. In the event preservation in place is not possible despite good faith efforts by the project applicant/developer and/or landowner, before ground-disturbing activities may resume on the project site, the landowner shall arrange a designated site location within the footprint of the project for the respectful reburial of the human remains and/or ceremonial objects. 6. Each occurrence of human remains and associated funerary objects will be stored using opaque cloth bags. All human remains, funerary objects, sacred objects and objects of cultural patrimony will be removed to a secure container on site if possible. These items should be retained and reburied within six months of recovery. The site of reburial/repatriation shall be on the project site but at a location agreed upon between the Tribe and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered. 7. The Tribe will work closely with the project's qualified archaeologist to ensure that the excavation is treated carefully, ethically, and respectfully. If data recovery is approved by the Tribe, documentation shall be prepared and				

THRESHOLD	PROJECT DESIGN FEATURES (PDF)	MITIGATION MEASURES (MMS)	RESPONSIBLE PARTY	MONITORING PARTY	IMPLEMENTATION STAGE	LEVEL OF SIGNIFICANCE
		shall include (at a minimum) detailed descriptive notes and sketches. All data recovery data recovery-related forms of documentation shall be approved in advance by the Tribe. If any data recovery is performed, once complete, a final report shall be submitted to the Tribe and the NAHC. The Tribe does NOT authorize any scientific study or the utilization of any invasive and/or destructive diagnostics on human remains.				
4.17 Utilities and Service Systems						
Summary of Impacts						
Threshold a: Would the Project require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	PDF GHG-2 shall apply.	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impacts
Threshold b: Would the Project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impacts
Threshold c: Would the Project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impacts
Threshold d: Would the Project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impacts
Threshold e: Would the Project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	N/A	No mitigation is required.	N/A	N/A	N/A	Less-than-Significant Impacts

CC RESOLUTION NO. 2024-__

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF LOS ALAMITOS, CERTIFYING THE FINAL ENVIRONMENTAL IMPACT REPORT, ADOPTING A STATEMENT OF OVERRIDING CONSIDERATIONS, AND ADOPTING A MITIGATION MONITORING AND REPORTING PLAN FOR THE 4665 LAMPSON PROJECT LOCATED AT 4665 LAMPSON AVENUE (APN 130-012-35) TO ALLOW REDEVELOPMENT OF THE PROJECT SITE WITH 246 RESIDENTIAL UNITS (APPLICANT: LAMPSON PARK PLACE, LLC)

WHEREAS, Lampson Park Place, LLC ("Applicant") proposes to demolish the existing office building and surface parking lot on the 12.3-acre property located at 4665 Lampson Avenue (APN 130-012-35) and redevelop the site with a 246-unit residential development consisting of a variety of housing product types, including 55 single-family detached homes, 114 townhomes, and 77 for-rent multi-family apartment homes comprised of 76 units restricted to lower income households and one unrestricted manager's unit (the "Project"); and,

WHEREAS, an Environmental Impact Report ("EIR") for the Project, incorporated by reference herein, has been completed in compliance with the California Environmental Quality Act ("CEQA"), the guidelines promulgated by the State Secretary for Natural Resources, and the procedures for review as set forth in the 2007 City of Los Alamitos Guidelines for Implementation of the CEQA (Local CEQA Guidelines); and,

WHEREAS, notice regarding the EIR for the Project was sent to neighboring property owners pursuant to the City's CEQA Guidelines, concerning the review period commencing April 24, 2024; and,

WHEREAS, copies of the EIR have been made available for a 45-day review period to pertinent agencies and interested members of the public, commencing on April 24, 2024; and,

WHEREAS, all written comment letters received within the 45-day public review period have been noted in the record, responded to by Staff, and none of the comments alter the conclusions in the EIR; and,

WHEREAS, changes to the EIR have been made that amplify and clarify the analysis; and,

WHEREAS, it has been determined that the proposed Project may potentially have significant effects on the environment, and revisions in the Project proposal would mitigate most of the effects to a point where clearly no significant effect would occur; and,

DRAFT

WHEREAS, potential off-site impacts related to vehicle miles travelled (VMT) result in a significant and unavoidable VMT impact on a direct and cumulatively considerable basis, and the City has prepared a Statement of Overriding Considerations to demonstrate that the Project's benefits outweigh the significant and unavoidable VMT impact identified in the EIR; and

WHEREAS, on September 25, 2024, the Planning Commission of the City of Los Alamitos held a duly noticed public hearing to review and consider the proposed Project, including the EIR and the Statement of Overriding Considerations. The Planning Commission recommended by resolution that the City Council certify the EIR, and adopt the Statement of Overriding Considerations and Mitigation Monitoring and Reporting Plan ("MMRP"); and,

WHEREAS, the City Council considered the certification of the EIR, and adoption of the Statement of Overriding Considerations and MMRP, attached hereto and incorporated by reference herein, at a duly noticed public hearing on October 21, 2024, at which hearing it considered all the evidence presented, both written and oral; and,

WHEREAS, the Applicant, Applicant's representatives and members of the public were provided the opportunity to present written and oral testimony.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF LOS ALAMITOS, CALIFORNIA, DOES RESOLVE AS FOLLOWS:

SECTION 1. The City Council of the City of Los Alamitos, California, finds that the above recitals are true and correct and are incorporated by reference herein.

SECTION 2. The City Council has reviewed and considered the environmental documentation as well as the conditions cited in Exhibit "A," for the Project prior to taking action. Based on the analysis contained in the EIR and the accompanying environmental information, in compliance with CEQA (Public Resources Code Section 21000, et seq., the State CEQA Guidelines (California Code of Regulations, Title 14, Sections 15000, et seq.), and the City's Local CEQA Guidelines, the City Council hereby certifies the EIR and adopts the Statement of Overriding Considerations and MMRP, incorporated by reference herein. In certifying the EIR and adopting the Statement of Overriding Considerations, the City Council finds as follows:

A. The EIR was prepared in accordance with all legal requirements, including all public notice and comment period requirements.

B. The CEQA requires preparation of an environmental impact report if there is substantial evidence in light of the whole record that the Project may have a potentially significant environmental effect on the environment. An environmental impact report was prepared which demonstrates that the proposed Project will not cause any significant onsite environmental damage as this is a Project on property that already has been designated as an area for residential units and there are no

fish or wildlife habitat on site. The site was previously graded for the construction of the existing commercial building.

Regarding potential off-site impacts, Project components and mitigation measures available to reduce vehicle miles travelled (VMT) include developing pedestrian network improvements and implementing travel demand model (TDM) measures such as those listed in Mitigation Measure MM 4.15-1. Even where the TDM measures are implemented to their maximum effectiveness of 10%, the Project would still not be able to reduce its VMT impact to a level of less than significant which requires a 31.8% reduction for baseline (2022) conditions and 27.7% for buildout (2045) conditions. Therefore, the Project is found to have a significant and unavoidable VMT impact on a direct and cumulatively considerable basis. All feasible mitigation measures were incorporated to reduce VMT impacts per measures identified in the 2021 California Air Pollution Control Officers Association (CAPCOA) Handbook; however, even with incorporation of all feasible mitigation measures, impacts would remain significant and unavoidable.

C. The Project is consistent with the General Plan objectives, policies and programs. The proposed Project allows for the development of 246 residential units at a density of 20 dwelling units an acre which is within the General Plan multi-family residential land use designation of 20 – 25 units per acre. The proposed design and improvements of the 246 residential unit Project are consistent with the applicable General Plan goals, policies, and implementation measures.

D. The Project will not adversely affect the public health, safety and welfare. The proposed Project design and improvements will not adversely affect the public health of the citizens of the City of Los Alamitos as the Project is the type of use which is planned for in this area; the residential Project will be compatible with the single-family and multifamily residential uses in the area. The mitigation measures required by the CEQA document, along with the recommended Conditions of Approval, will ensure the safety of the inhabitants of the Project and will contribute to the health of the community as a whole.

E. The EIR identified potentially significant impacts to VMT which could result from the Project. Mitigation measures have been identified which reduce some of these impacts yet not to a level of less than significant. Even with incorporation of mitigation measures from the EIR into the conditions of Project approval, this impact is significant and unavoidable and would not be mitigated to a less than significant level. Per Public Resources Code section 21081(a)(3), specific economic, legal, social, technological, or other considerations, including considerations for the provision of employment opportunities for highly trained workers, make infeasible additional mitigation. Pursuant to the CEQA, with respect to the identified significant unavoidable environmental effects of the Project, the City Council has weighed the economic, legal, social, technological, and other benefits, including region-wide and statewide environmental benefits, of the

Project against its unavoidable significant environmental impacts in determining whether to approve the Project. The City Council finds that the benefits of the Project outweigh its unavoidable adverse environmental effects such that the adverse environmental effects may be considered "acceptable." A Statement of Overriding Considerations, incorporated by reference herein, was prepared and each of the separate benefits listed provides a separate and independent ground for the City's decision that the Project's benefits outweigh the significant and unavoidable environmental impact identified in the EIR.

F. The City has complied with the CEQA. Pursuant to the provisions of the CEQA, an EIR was prepared which led to the conclusion that a Statement of Overriding Considerations be prepared for this Project. The purpose of an environmental impact report is to identify potential effects on the environment of the Project and to indicate the manner in which those potential significant effects can be avoided or mitigated. A primary function of the environmental impact report is to disclose and evaluate Project impacts and inform decision makers for the Project. To meet the 45-day circulation requirement, a notice regarding the EIR was circulated from April 24 to June 10, 2024 (SCH#2022090476).

G. Together, the draft Environmental Impact Report ("DEIR"), the revisions to the DEIR, the comments of persons and organizations commenting on the DEIR and a list of all such persons and organizations, the responses to the comments, and other information added by the City constitute the final Environmental Impact Report ("FEIR") on the Project.

H. No new significant information has been added to the EIR since circulation of the DEIR that would require recirculation of the EIR. Recirculation of the draft EIR is not required where the new information merely clarifies, amplifies or makes minor modifications to an adequate EIR. The information provided since the draft EIR meets those criteria. All the text revisions to the draft EIR provide clarification and additional detail. After considering all comments received on the draft EIR, the City of Los Alamitos has determined that the changes do not result in a need to recirculate the draft EIR.

I. The final EIR reflects the City of Los Alamitos' independent judgement and analysis.

SECTION 3. Based on the entire record before the City Council, including the written and oral record and the findings set forth in the Resolution, the City Council hereby certifies the Environmental Impact Report, and adopts the Statement of Overriding Considerations and Mitigation Monitoring and Reporting Plan, incorporated by reference herein, for the 4665 Lampson Project at 4665 Lampson Avenue, APN 130-012-35.

SECTION 4. The City Clerk shall forward a copy of this Resolution to the Applicant and any person requesting the same, and Staff shall file a Notice of Determination with the County Clerk.

DRAFT

CC RESOLUTION NO. 2024-__

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF LOS ALAMITOS, CALIFORNIA, APPROVING AN AFFORDABLE HOUSING UNIT APPLICATION FOR THE 4665 LAMPSON PROJECT LOCATED AT 4665 LAMPSON AVENUE, IN THE MULTI-FAMILY RESIDENTIAL (R-3) ZONING DISTRICT (APN 130-012-35) TO ALLOW REDEVELOPMENT OF THE PROJECT SITE WITH 246 RESIDENTIAL UNITS, INCLUDING 76 AFFORDABLE MULTI-FAMILY APARTMENT HOMES (APPLICANT: LAMPSON PARK PLACE, LLC)

WHEREAS, Lampson Park Place, LLC ("Applicant") proposes to demolish the existing office building and surface parking lot on the 12.3-acre property located at 4665 Lampson Avenue (APN 130-012-35) and redevelop the site with a 246-unit residential development consisting of a variety of housing product types, including 55 single-family detached homes, 114 townhomes, and 77 for-rent multi-family apartment homes comprised of 76 units restricted to lower income households and one unrestricted manager's unit (the "Project"); and,

WHEREAS, a completed Affordable Housing Unit Application was submitted by Lampson Park Place, LLC, on October 11, 2022, requesting approval for 246 residential units, including 76 affordable multi-family apartment homes; and,

WHEREAS, pursuant to the State's Density Bonus Law, the application also included requests for incentives, concessions and waivers for the following: reduction in setback distance between structures, exception for building step back requirements, reduction in minimum storage space, reduced common area requirement, and reduced parking requirement; and,

WHEREAS, pursuant to Government Code Section 65915, the verified application constitutes a request as required by Section 17.28.050 (Affordable Housing) of the Los Alamitos Municipal Code; and,

WHEREAS, the State Density Bonus Law codified in Government Code Section 65915 to 65918 provides a mechanism that allows housing developers to increase density on a property above the maximum allowed under a jurisdiction's General Plan or zoning and to request relief from development standards in exchange for offering to build or donate land for affordable or senior housing units. A developer who meets the requirements of the State law is entitled to receive the density bonus and other benefits (i.e., incentives, concessions, waivers, and reduction of development standards) as a matter of right; and,

WHEREAS, California Government Code Section 65589.5, also known as the Housing Accountability Act, prohibits a local agency from disapproving, or conditioning

approval in a manner that renders infeasible, a housing development Project for very low, low-, or moderate-income households or an emergency shelter unless the local agency makes specified written findings based on a preponderance of the evidence in the record; and,

WHEREAS, the receipt of a density bonus, incentive, concession, waiver, or reduction of development standards pursuant to Section 65915 shall not constitute a valid basis on which to find a proposed housing development Project inconsistent, not in compliance, or not in conformity, with an applicable plan, program, policy, ordinance, standard, requirement, or other similar provision; and,

WHEREAS, on September 25, 2024, the Planning Commission of the City of Los Alamitos held a duly noticed public hearing to review and consider the application. The Planning Commission recommended by resolution that the City Council approve the Affordable Housing Unit Application, including the requested incentives, concessions, waivers, and reductions in development standards; and,

WHEREAS, the City Council reviewed and considered the Affordable Housing Unit Application, incorporated by reference herein, at a duly noticed public hearing on October 21, 2024, at which hearing it considered all the evidence presented, both written and oral; and,

WHEREAS, the Applicant, Applicant's representatives and members of the public were provided the opportunity to present written and oral testimony.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF LOS ALAMITOS, CALIFORNIA, DOES RESOLVE AS FOLLOWS:

SECTION 1. The City Council of the City of Los Alamitos, California, finds that the above recitals are true and correct and are incorporated by reference herein.

SECTION 2. The City Council hereby makes the following findings or determinations made in accordance with Section 17.28.050 of the LAMC, which is which is based on all of the evidence presented, both written and oral;

The design and layout of the proposed development are consistent with the development and design standards/guidelines of the applicable zoning district: The design and layout of the 246 residential units at 4665 Lampson Avenue, as conditioned, is consistent with the development and design standards/guidelines of the Multiple Family (R-3) Residential Zoning District as well as with the requirements for residential development set forth in Section 17.34.060. The development meets, or will be conditioned to meet, all requirements. Each proposed unit and the entire Project meets the development standards for the R-3 zone including parcel area, parcel depth, maximum density, minimum dwelling area, and site coverage. Pursuant to the State's Density Bonus legislation, minor incentives, concessions, waivers, and/or reductions in development standards

have been requested for reduction in setback distance between structures, exception for building step back requirements, reduction in minimum storage space, reduced common area requirement, and reduced parking requirement as described below:

Reduction in setback distance between structures. LAMC Section 17.08.030, Table 2-03 requires a 10-foot minimum distance between structures. Though most of the Project's single-family residential setback distances between structures meet or exceed the minimum distances, the setback distance is reduced to 6 feet at certain locations within the Project site plan. Meeting the required 10-foot minimum setback distance would require a significant change to the site plan and likely result in a reduction of residential units.

Exception for building step back requirements. LAMC Section 17.08.045.A.1 requires that for buildings higher than two stories, the third story must have a minimum 5-foot step back from the story below to minimize building bulk and create façade articulation. This requirement appears to govern regardless of building location within a Project site or surrounding land uses. While the City interprets this requirement as applying only to perimeter buildings (i.e., buildings that are located along the perimeter of a Project site), given the requirement's ambiguity, the Applicant is requesting an exception from the required minimum 5-foot step back requirement for those structures identified on the site plan.

Reduction in minimum storage space. LAMC Section 17.08.030, Table 2-03, requires a minimum storage space in a garage or carport of 200 cubic feet per unit. For certain units within the Project, this storage space requirement will be difficult to satisfy because of limitations in garage and carport space. As such, the Applicant is requesting that the minimum storage space requirement be reduced to 175 cubic feet per unit for market rate units and 50 cubic feet per unit for affordable units identified on the site plan.

Reduced common area requirement. LAMC Section 17.08.030, Table 2-03 requires a minimum 200 square feet of common area and 60 square feet of private space per unit. The Project will be able to comply with the minimum private space requirement, but the Project will not be able to comply with the common area requirement. This is due to the proposed dedication or grant of an easement related to the northerly 10-foot strip of land abutting Arbor Park and Arbor Dog Park, which comprises an area of approximately 10,000 square feet of property. When this area is dedicated or granted to the City, then the Project will be unable to comply with the common area requirement because compliance with this requirement would physically preclude construction of the Project at the densities allowed and with the concessions described above. Therefore, the Applicant is requesting a reduction in the common area requirement from 200 to 150 square foot per unit.

Parking Reduction Request. The Project would provide 577 parking spaces (475 spaces for the single family detached and townhomes and 102 for the apartments), which is below the City's required 679 parking spaces pursuant to LAMC Section 17.22.030, Required Parking Spaces. The State's Density Bonus Law specifies that for housing developments that qualify for a density bonus the local government shall not require a vehicular parking ratio, inclusive of parking for persons with a disability and guests, that exceeds the following ratios: (A) zero to one bedroom: one onsite parking space; (B) two to three bedrooms: one and one-half onsite parking spaces; and (C) four and more bedrooms: two and one-half parking spaces. (Gov't Code Section 65915(p)(1).) The Applicant requests that the City require no more than 2.35 spaces per unit for a total of 577 parking spaces for the Project, which is significantly more than the 441 parking spaces that would be required pursuant to the State's Density Bonus Law.

SECTION 3. Prior to final map approval, the applicant shall record covenants with the County Recorder for the low and/or very low affordability requirements of said 76 units to remain affordable for a period no less than 55 years in accordance with Government Code Section 65915 and Los Alamitos Municipal Code Section 17.28.050, as described in Condition Nos. 16 - 23.

SECTION 4. Pursuant to the provisions of the California Environmental Quality Act (CEQA) an Environmental Impact Report ("EIR") was prepared which led to the conclusion that a Statement of Overriding Considerations be prepared for this Project. The purpose of an EIR is to identify potential effects on the environment of the Project and to indicate the manner in which those potential significant effects can be avoided or mitigated. A primary function of the EIR is to disclose and evaluate Project impacts and inform decision makers for the Project. To meet the 45-day circulation requirement, a notice regarding the draft EIR was circulated from April 24 to June 10, 2024 (SCH#2022090476).

SECTION 5. Based upon such findings and determinations, the City Council hereby approves an Affordable Housing Unit Application, including the requested incentives, concessions, waivers, and reductions in development standards, as represented by the plans and elevations incorporated by reference herein, and subject to the conditions located in Exhibit "A."

SECTION 6. The City Clerk shall forward a copy of this Resolution to the Applicant and any person requesting the same, and Staff shall file a Notice of Determination with the County Clerk.

DRAFT

CC RESOLUTION NO. 2024-__

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF LOS ALAMITOS, CALIFORNIA, APPROVING SITE DEVELOPMENT PERMIT – MAJOR FOR THE 4665 LAMPSON PROJECT LOCATED AT 4665 LAMPSON AVENUE, IN THE MULTI-FAMILY RESIDENTIAL (R-3) ZONING DISTRICT (APN 130-012-35) TO ALLOW REDEVELOPMENT OF THE PROJECT SITE WITH 246 RESIDENTIAL UNITS (APPLICANT: LAMPSON PARK PLACE, LLC)

WHEREAS, Lampson Park Place, LLC ("Applicant") proposes to demolish the existing office building and surface parking lot on the 12.3-acre property located at 4665 Lampson Avenue (APN 130-012-35) and redevelop the site with a 246-unit residential development consisting of a variety of housing product types, including 55 single-family detached homes, 114 townhomes, and 77 for-rent multi-family apartment homes comprised of 76 units restricted to lower income households and one unrestricted manager's unit (the "Project"); and**,**

WHEREAS, a completed application for a Site Development Permit – Major was submitted for the Project by Lampson Park Place, LLC, on November 18, 2023; and,

WHEREAS, the Project would include a total of 246 units and the overall density for the Project would be 20 dwelling units per acre. The Project would provide 577 parking spaces (475 spaces for the single family detached and townhomes and 102 for the apartments) in exceedance of the 441 parking spaces that would be required pursuant to the State's Density Bonus Law; and,

WHEREAS, the verified application constitutes a request as required by Section 17.44.040 and Section 17.08.020 Table 2-02 (Allowed Uses and Permit Requirements for Residential Zoning Districts) of the Los Alamitos Municipal Code (LAMC); and,

WHEREAS, on September 25, 2024, the Planning Commission of the City of Los Alamitos held a duly noticed public hearing to review and consider the application. The Planning Commission recommended by resolution that the City Council approve the Site Development Permit – Major; and,

WHEREAS, the City Council reviewed and considered the Site Development Permit – Major, incorporated by reference herein, at a duly noticed public hearing on October 21, 2024, at which hearing it considered all the evidence presented, both written and oral; and,

WHEREAS, the Applicant, Applicant's representatives and members of the public were provided the opportunity to present written and oral testimony.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF LOS ALAMITOS, CALIFORNIA, DOES RESOLVE AS FOLLOWS:

SECTION 1. The City Council of the City of Los Alamitos, California, finds that the above recitals are true and correct and are incorporated by reference herein.

SECTION 2. The City Council hereby makes the following findings made in accordance with Section 17.44.060 of the LAMC, which is based on all of the evidence presented, both written and oral; the Staff report and final Environmental Impact Report are incorporated by reference herein:

1. *The proposed project is allowed within the subject zone:* The property is designated and zoned for this type of development. The Project site has a land use designation of Multi-Family Residential - 25 and a zoning classification of Multi-Family Residential - 25 (R-3).

2. *The proposed project complies with all of the applicable criteria identified in 17.44.030(B) (Application Processing, Filing, and Review—Generally):* The design and layout of the proposed residential units at 4665 Lampson Avenue is efficient, consistent with applicable City regulations and policies, and would not interfere with the use and enjoyment of neighboring residential developments, as the surrounding residential uses are comprised of single-family and multi-family. The location is appropriate for a 246-unit residential development that would be constructed in an architectural style that complements nearby homes. The Project will retain beautiful landscaping through the strength of a Homeowner's Association that will hire and maintain a maintenance crew. The Homeowner's Association will have regulations that are more exacting than the City' s Code concerning maintenance and parking. The location of the driveway ingress/egress access to the site would not create traffic or pedestrian hazards. The design and layout of the 246 residential units at 4665 Lampson Avenue, as conditioned, is consistent with the development and design standards/guidelines. Pursuant to the State’s Density Bonus legislation and LAMC 17.28.050, minor incentives, concessions, waivers, and/or reductions in development standards have been requested for reduction in setback distance between structures, exception for building step back requirements, reduction in minimum storage space, reduced common area requirement, and reduced parking requirement.

3. *The proposed project is in keeping with the character of the neighborhood, in terms of the structure(s) general appearance:* The design of the 246 residential units would be in keeping with the neighborhood character and enhance the attractive, harmonious, and orderly development of the property. The design is in harmony with surrounding development and improves upon the City's architecture with quality detached single-family, townhome, and multi-family residential building design, extensive landscaping, and maintenance requirements.

DRAFT

4. *The design of the proposed development will provide a desirable environment for its occupants and visiting public as well as its neighbors through good aesthetic use of materials, texture, and color, and will remain aesthetically appealing and retain an appropriate level of maintenance:* The design of the 246 residential units would provide a desirable environment for its occupants, visiting public, and its neighbors through good aesthetic use of materials, texture, landscaping, and color as depicted in the plan set incorporated by reference herein. Site redevelopment would continue the attractive environment that the existing property previously enjoyed for years and maintain an appropriate level of maintenance, through the implementation of a homeowners' association and the use of covenants, conditions, and restrictions.

5. *The proposed development would not be detrimental to the public health, safety, or welfare or materially injurious to the properties or improvements in the vicinity:* The 246 residential units provide for public health, safety, and welfare of the residential and business communities by providing more living options to the City rather than causing sprawl at the fringes of this metropolitan area. The buildings will meet all building code requirements. The mitigation measures identified in the Environmental Impact Report prepared for the Project would ensure the safety of the inhabitants of the Project as well as other residents of Los Alamitos. Also, the 246 residential units would not depreciate property values in the vicinity, as the area is zoned for this type of use and it will improve the aesthetics of this residential neighborhood area (formerly a commercial and now vacant property).

6. The proposed Project would assist the City of Los Alamitos in providing for the State mandated units identified in the General Plan for moderate, low and/or very low-income categories as described in the Regional Housing Needs Assessment. Remaining sites identified in the housing element are adequate to meet the requirements of Government Code Section 65583.2 and to accommodate the jurisdiction's share of the regional housing need pursuant to Section 65584.

   The City's Regional Housing Needs Allocation (RHNA) for the 6th Cycle Housing Element Update is a total of 769 units, which is comprised of 313 lower income units, 145 moderate income units, and 311 above moderate-income units. The City's Housing Element identified that the City's residential capacity is 817 total units, which exceeds the City's RHNA obligation of 769 units by 48 units. This surplus, or "buffer," of 48 units is comprised of 19 surplus lower income units, 14 moderate income units, and 15 surplus above moderate-income units.

   The Housing Sites Inventory identifies the total number of units for the proposed Project site as 246 units, and those units are projected to consist of 77 lower income units, zero moderate income units, and 169 above moderate-income units. The proposed residential Project proposes 76 lower income units, zero moderate income units, and 170 above moderate-income units

As such, approval of the Project on the site identified in the Housing Sites Inventory will result in the need for the City to deduct one lower income unit from the City's surplus "buffer" of 19 lower income units, resulting in a remaining surplus "buffer" of 18 lower income units. Accordingly, even after approval of the Project, the remaining sites identified in the City's Housing Element are adequate to meet the requirements of Section 65583.2 and to accommodate the jurisdiction's share of the regional housing need pursuant to Section 65584.

SECTION 3. Pursuant to the provisions of the California Environmental Quality Act (CEQA) an Environmental Impact Report ("EIR") was prepared which led to the conclusion that a Statement of Overriding Considerations be prepared for this Project. The purpose of an EIR is to identify potential effects on the environment of the Project and to indicate the manner in which those potential significant effects can be avoided or mitigated. A primary function of the EIR is to disclose and evaluate Project impacts and inform decision makers for the Project. To meet the 45-day circulation requirement, a notice regarding the draft EIR was circulated from April 24 to June 10, 2024 (SCH#2022090476).

SECTION 4. Based upon such findings and determinations, the City Council hereby approves a Site Development Permit – Major, as represented by the plans and elevations incorporated by reference herein, and subject to the conditions located in Exhibit "A."

SECTION 5. The City Clerk shall forward a copy of this Resolution to the Applicant and any person requesting the same, and Staff shall file a Notice of Determination with the County Clerk.

PASSED, APPROVED, AND ADOPTED this _____ day of _____ 2024.

DRAFT

CC RESOLUTION NO. 2024-__

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF LOS ALAMITOS, CALIFORNIA, APPROVING TENTATIVE PARCEL MAP 2022-133 (FOR FINANCE AND CONVEYANCE PURPOSES) AND VESTING TENTATIVE TRACT MAP NO. 19263 (FOR CONDOMINIUM PURPOSES) FOR THE 4665 LAMPSON PROJECT LOCATED AT 4665 LAMPSON AVENUE (APN 130-012-35) TO ALLOW REDEVELOPMENT OF THE PROJECT SITE WITH 246 RESIDENTIAL UNITS (APPLICANT: LAMPSON PARK PLACE, LLC)

WHEREAS, Lampson Park Place, LLC ("Applicant") proposes to demolish the existing office building and surface parking lot on the 12.3-acre property located at 4665 Lampson Avenue (APN 130-012-35) and redevelop the site with a 246-unit residential development consisting of a variety of housing product types, including 55 single-family detached homes, 114 townhomes, and 77 for-rent multi-family apartment homes comprised of 76 units restricted to lower income households and one unrestricted manager's unit (the "Project"); and,

WHEREAS, a completed application for a Tentative Parcel Map and a Vesting Tentative Tract Map was submitted by Lampson Park Place, LLC, on November 18, 2023, requesting to subdivide the Project site; and,

WHEREAS, the Project would include a total of 246 units and the overall density for the Project would be 20 dwelling units per acre. The Project would provide 577 parking spaces (475 spaces for the single-family detached and townhomes and 102 for the apartments) exceeding the 441 parking spaces that would be required pursuant to the State's Density Bonus Law; and,

WHEREAS, the application included a tentative parcel map and a vesting tentative tract map as required by Section 16.06.030 (Tentative Parcel Maps) and Section 16.06.020 (Tentative Tract Maps) of the Los Alamitos Municipal Code (LAMC); and,

WHEREAS, the Applicant shall offer a dedication in fee or an easement to the City of a 10-foot-wide strip of land (approximately 10,000 square feet) adjacent to Arbor Park for the purpose of public ingress, egress and access by vehicles and pedestrians and the parking of vehicles; and,

WHEREAS, on September 25, 2024, the Planning Commission of the City of Los Alamitos held a duly noticed public hearing to review and consider the proposed Project, including the Tentative Parcel Map and the Vesting Tentative Tract Map. The Planning Commission recommended by resolution that the City Council approve the Tentative Parcel Map and the Vesting Tentative Tract Map; and,

WHEREAS, the City Council reviewed and considered the Tentative Parcel Map and the Vesting Tentative Tract Map, incorporated by reference herein, at a duly noticed public hearing on October 21, 2024, at which hearing it considered all the evidence presented, both written and oral; and,

WHEREAS, the Applicant, Applicant's representatives and members of the public were provided the opportunity to present written and oral testimony.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF LOS ALAMITOS, CALIFORNIA, DOES RESOLVE AS FOLLOWS:

SECTION 1. The City Council of the City of Los Alamitos, California, finds that the above recitals are true and correct and are incorporated by reference herein.

SECTION 2. The City Council hereby makes the following findings as set forth in the Subdivision Map Act as well as those required by Los Alamitos Municipal Code (LAMC) Sections 16.10.100 and 16.10.110:

1. *The proposed maps are consistent with the City' s General Plan.* The proposed maps allow for the site redevelopment with 246 residential units at a density of 20 dwelling units an acre which is within the General Plan multi-family residential land use designation of 20 – 25 units per acre. The proposed design of the Project subdivision is consistent with the applicable General Plan goals, policies, and implementation measures.

2. *The design and improvement of the proposed subdivisions is consistent with the City's General Plan.* The design and improvement of the 246-unit Project is suitable for residential development in the R-3 multifamily residential zone and the subdivisions can be developed in compliance with the General Plan.

3. *The site is physically suitable for the proposed type of development.* The site is physically suitable for a residential subdivision because the site is generally flat and will require minimal grading.

4. *The site is physically suitable for the proposed density of development.* The 12.3-acre site is capable of supporting the development of the proposed 246 residential units. The proposed Project is at 20 dwelling units per acre, within the maximum that the City's R- 3 zoning district allows at 25 dwelling units per acre under multi-family development.

5. *The requirements of the California Environmental Quality Act (CEQA) have been satisfied.* Pursuant to the provisions of the CEQA, an Environmental Impact Report ("EIR") was prepared which led to the conclusion that a Statement of Overriding Considerations be prepared for this Project. The purpose of an EIR is to identify potential effects on the environment of the Project and to indicate the manner in which those potential significant effects can be avoided or mitigated. A primary

function of the EIR is to disclose and evaluate Project impacts and inform decision makers for the Project. To meet the 45-day circulation requirement, a notice regarding the draft EIR was circulated from April 24 to June 10, 2024 (SCH#2022090476).

6. *The design of the subdivisions and proposed improvements are not likely to cause substantial environmental damage or substantial and avoidable injury to fish or wildlife in their habitat.* The proposed subdivisions will not cause any onsite environmental damage as this is an infill project on property that already has been designated as an area for residential units and there are no fish or wildlife habitat on site. The site was previously graded for construction of the existing commercial building.

7. *The design of the subdivisions and the proposed improvements are not likely to cause serious public health problems.* The proposed subdivisions design and improvements will not adversely affect the public health of the citizens of the City of Los Alamitos as the Project is the type of use which is planned for in this area; the residential Project will be compatible with the single-family and multi-family residential uses in the area. The mitigations required by the CEQA document will ensure the safety of the inhabitants of the Project and will contribute to the health of the community as a whole.

8. *The design of the subdivisions and improvements will not conflict with public access easement(s) through the property.* The design of the subdivisions and the proposed improvements will not conflict with any existing telephone, street, and/or public utility easements. There are no public access easements through the property.

9. *The design and improvements of the proposed subdivisions are suitable for the uses proposed and the subdivisions can be developed in compliance with the applicable zoning regulations.* As conditioned, the Project will comply with applicable zoning regulations. Pursuant to the State's Density Bonus legislation, minor incentives, concessions, waivers, and/or reductions in development standards have been requested for reduction in setback distance between structures, exception for building step back requirements, reduction in minimum storage space, reduced common area requirement, and reduced parking requirement.

10. *The discharge of waste into an existing community sewer system will not result in or add to a violation of existing requirements prescribed by the Regional Water Quality Control Board.* The discharge of wastewater from the subdivision into the sewer system will not result in a violation of existing requirements prescribed by the Regional Water Quality Control Board.

SECTION 3. Based upon such findings and determinations, the City Council hereby approves Tentative Parcel Map 2022-133 and Vesting Tentative Tract Map No. 19263 attached as Exhibits “B” and "C," and incorporated by reference herein, subject to the conditions located in Exhibit "A."

SECTION 4. The City Clerk shall forward a copy of this Resolution to the Applicant and any person requesting the same, and Staff shall file a Notice of Determination with the County Clerk.

EXHIBIT A

4665 LAMPSON PROJECT
CONDITIONS OF APPROVAL

Site Development Permit – Major, Tentative Parcel Map No. 2022-133, Vesting Tentative Tract Map No. 19263, Affordable Housing Unit Application, and Environmental Impact Report

**The following Conditions of Approval shall be binding on and enforceable against each of the following, and whenever used herein, the term "Applicant" shall mean and refer to, each of the following: Lampson Park Place. LLC, and the future owner(s) and tenant(s) of the property, and each of their respective successors and assigns.

GENERAL

1. Approval of this application is to construct a 246 residential unit project at 4665 Lampson Avenue (APN 130-012-35) pursuant to City Council approval of a Site Development Permit – Major, Tentative Parcel Map 2022-133 (for Finance and Conveyance Purposes), Vesting Tentative Tract Map No. 19263 (for Condominium Purposes), and an Affordable Housing Unit Application for Density Bonus and/or Incentives or Concessions and a Waiver to redevelop the Project site (the "Project") noted thereon the plans incorporated by reference herein, and on file in the Development Services Department. Subsequent submittals for the Project shall be substantially consistent with such plans and in compliance with the applicable land use regulations of the Los Alamitos Municipal Code. If any changes are proposed regarding the location or alteration of the plans dated April 4, 2023, and January 16, 2024 (and as may be revised and approved by the City Council), a request for an amendment of this approval must be submitted to the Development Services Director. If the Development Services Director determines that the proposed change or changes are substantially consistent with the provisions and spirit of intent of this approval action, and that such action would have been the same with the proposed change or changes as for the proposal approved herein, the amendment may be approved by the Development Services Director without requiring a public meeting.

2. The duration of the Site Development Permit approval and the Affordable Housing Unit Application for Density Bonus and/or Incentives or Concessions shall be twenty-four (24) months from the date the site plan is approved. If construction is commenced within this twenty-four (24) month period and construction is being pursued diligently toward completion, the Site Development Permit approval and the Affordable Housing Unit Application for Density Bonus and/or Incentives or Concessions and a Waiver shall remain in full force and effect.

3. The Development Services Director may, upon receipt in writing from the Applicant before the expiration date, grant three (3) extensions of time up to twelve (12) months maximum. If an extension of time is not granted, the Site Plan Review approval shall expire, and a new application shall be made.

4. City Council approval of the Tentative Parcel Map 2022-133 and Vesting Tentative Tract Map No. 19263 shall remain valid for twenty-four (24) months. The Maps shall expire on October 21, 2026, unless the applicant requests a time extension as outlined by City standards and in

conformance with Section 16.10.130 (Period of Validity – Extensions) of the Los Alamitos Municipal Code.

5. Prior to issuance of a building permit, copies of the recorded maps shall be provided to the Development Services Department. Model homes are exempt from this condition.

6. To the fullest extent permitted by law, the Applicant shall, at its sole cost and expense, protect, defend, indemnify, and hold harmless the City, its elected and appointed officers and officials, employees, agents, departments, agencies, authorized volunteers, consultants, boards, commissions, and committees, and instrumentalities thereof ("Indemnitees"), from and against any and all claims, liabilities, losses, fines, demands, penalties, lawsuits, writs of mandamus, and any other claims or actions or proceedings of any kind whatsoever (whether legal, equitable, declaratory, administrative or adjudicatory in nature), and alternative dispute resolution procedures (including, but not limited to, arbitrations, mediations, and other such procedures), judgments, orders and decisions (collectively "Claims" and “Actions”), brought against the Indemnitees, which seek to attack, challenge, modify, set aside, void, or annul any action of or any permit or approval issued by the Indemnitees (including actions approved by the voters of the City) for, in connection with, or concerning the Project. It is expressly understood and agreed that the City shall have the right to approve, which approval will not be unreasonably withheld, the legal counsel providing the defense of the Indemnitees for the Claims and Actions, and that the Applicant shall promptly reimburse the City for all costs and expenses directly and necessarily incurred by the City in the course of the defense, including reasonable attorneys' fees. The City shall promptly notify the Applicant of any Claims and Actions brought against the Indemnitees and shall cooperate in the defense of any such Claims and Actions. If the Applicant fails to so defend the Claims and Actions, the City shall have the right but not the obligation to do so and, if it does, the Applicant shall promptly pay the City's full cost thereof.

7. The Applicant shall file an Acknowledgment of Conditions of Approval with the Development Services Department within 30 days of final approval of all resolutions. The Applicant shall be required to record the Acknowledgment of these Conditions of Approval with the Office of the Orange County Recorder and proof of such recordation shall be submitted to the Development Services Department before issuing any permits.

8. Failure to satisfy and/or comply with the conditions herein may result in a recommendation to the Planning Commission and/or City Council for revocation of this approval.

9. The Applicant shall comply with applicable City, County, and/or State regulations.

10. The Applicant shall be required to comply with the Seismic Hazards Mapping Act of 1990, including the Guidelines for Evaluating and Mitigating Seismic Hazards in California 1997.

11. In case of violation of any of the conditions of approval or applicable law, the City shall issue Applicant a Notice of Potential Violation, and if said violation is not remedied within a reasonable period of time, then the City shall issue Applicant a Notice of Correction. If subsequent violations of the conditions of approval and/or City law occurs within ninety days of any Notice of Correction, the Applicant shall be held responsible to reimburse the City for all Staff time directly attributable to enforcement of the conditions of approval, mitigation measures, and/or City law including but not limited to, revocation of the herein approvals.

The Applicant shall be responsible for implementing the mitigation measures identified in the Environmental Impact Report to the satisfaction of the City of Los Alamitos Development Services Department.

12. Project plans shall be subject to a complete code compliance review with the Development Services Department when the plans are submitted for plan check and shall comply with all applicable City of Los Alamitos ordinances, regulations, and policies prior to building permit issuance, including, but not limited to, the requirements established or authorized by Title 15, 16, and 17 of the City of Los Alamitos Municipal Code.

13. All invoices the Applicant has received from the City shall be paid to a zero balance by certificate of occupancy for any portion of the Project.

14. Prior to issuance of a certificate of occupancy for any portion of the Project, the Applicant shall offer a dedication in fee or an easement to the City of a 10-foot-wide strip of land (approximately 10,000 square feet) adjacent to Arbor Park for the purpose of public ingress, egress and access by vehicles and pedestrians and the parking of vehicles. The form of such conveyance shall be subject to approval by the City Attorney.

15. The Applicant shall notify buyers and/or renters that the Project site is within an airport influence area and may experience annoyances or inconveniences associated with proximity to airport operations (for example: noise, vibration, or odors) and provide all related disclosures as required by State law.

AFFORDABLE HOUSING/DENSITY BONUS

16. Prior to the issuance of any building permit on Parcel 2, and after recordation of the parcel map, Applicant shall convey Parcel 1 to an affordable housing provider, for the purpose of constructing and managing seventy-seven (77) multi-family units which shall be comprised of seventy-six (76) units restricted to lower income and with one unrestricted manager's unit (the "apartment complex").

17. Applicant agrees that the 76 affordable units shall be rented to lower income households as defined in Section 50079.5 of the California Health and Safety Code for a period of no less than 55 years, commencing with the issuance of certificate of occupancy for any portion of the apartment complex, at rents that do not exceed the maximum rent for 80% income level units for that size unit in Orange County as published annually by the California Tax Credit Allocation Committee ("CTCAC"). Determinations of household income levels shall be made in accordance with the regulations published from time to time by the California Department of Housing and Community Development pursuant to Health and Safety Code Section 50093.

18. The Applicant shall enter into a regulatory agreement with the City memorializing the provision of lower income housing, and the granting of the requested Density Bonus Law concessions and waivers. The regulatory agreement shall be recorded against only the parcel that will include the apartment complex (Parcel 1) in the Official Records of Orange County, California immediately after final parcel map approval and shall be binding upon all future owners and successors in interest of the apartment complex.

19. The regulatory agreement shall be prepared by the City at the Applicant's expense. Prior to the City commencing preparation of a regulatory agreement, the Applicant shall execute a

reimbursement agreement with the City in a form approved by the City Attorney and provide a deposit to the City in an amount sufficient to cover the estimated total professional fees and costs to be incurred by the City for preparation of the regulatory agreement, as determined by the City Manager in his reasonable discretion. The City Manager is authorized to execute said reimbursement agreement on behalf of the City.

20. The regulatory agreement shall remain a senior, non-subordinate covenant and as an encumbrance running with the land for the full term thereof. In no event shall the regulatory agreement be made junior or subordinate to any deed of trust or other documents providing financing for the construction or operation of the apartment complex, or any other lien or encumbrance whatsoever for the entire term of the required covenants.

21. The regulatory agreement shall include provisions addressing or requiring the following:

    a. Identification of Affordable Units. The number, affordability level, unit size mix, and location of the affordable units shall be set forth in the regulatory agreement.

    b. Timing of Construction. The regulatory agreement shall require that grading shall commence on Parcel 1 concurrently with grading on Parcel 2.

    c. Annual Tenant Income Verification, Compliance Reporting, and Certification. The regulatory agreement shall include uniform provisions requiring the Applicant to verify and certify, prior to the initial occupancy, and annually thereafter, that each tenant household occupying each affordable unit meets the applicable income and eligibility requirements established for the affordable unit.

    d. Maintenance Standards. The regulatory agreement shall contain uniform provisions governing the Applicant's maintenance obligations and the City's rights in the event the owner fails to adhere to its maintenance obligations.

    e. Compliance Report. The regulatory agreement shall contain provisions requiring the Applicant to submit an annual compliance report containing specified information to the City in a form reasonably satisfactory to the City Manager and to annually certify that the affordable units are in compliance with the requirements of the regulatory agreement.

    f. Recordkeeping Requirements. The regulatory agreement shall contain uniform provisions requiring the owner to maintain tenant leases, income certifications, and other books, documents, and records related to the rental of the affordable units and operation of the apartment complex for a period of not less than five (5) years after creation of each such record; to allow the City to inspect any such books, documents, or records and to conduct an independent audit or inspection of such records at a location that is reasonably acceptable to the City Manager upon prior written notice; and to permit the City and its authorized agents and representatives to access the property and examine the housing units and to interview owners, occupants, tenants and employees for the purpose of verifying compliance with the regulatory agreement.

    g. Marketing and Management Plan for Affordable Units. The regulatory agreement shall contain uniform provisions regarding property management and management responsibilities and shall require the Applicant to prepare and obtain the City's approval of a marketing and management plan for the apartment complex prior to the issuance of

a certificate of occupancy for any portion of the apartment complex. The marketing and management plan shall address in detail, without limitation, the following matters: (i) how the Applicant plans to market the affordable units to prospective tenant households; (ii) procedures for the selection of tenants of affordable units, including a description of how the Applicant plans to certify the eligibility of tenant households; (iii) procedures for annually verifying income and recertifying the eligibility of tenants of affordable units; (iv) the standard form(s) of rental agreement(s) the Applicant proposes to enter into with tenants of affordable units; (v) procedures for the collection of rent; (vi) procedures for eviction of tenants; (vii) procedures for ensuring that the required number and unit size mix of affordable units is maintained; (viii) procedures for complying with the Applicant's monitoring and recordkeeping obligations; (ix) the Applicant's property management duties; (x) the Applicant's plan to manage and maintain the apartment complex and the affordable units; (xi) the rules and regulations of the property and manner of enforcement; and (xii) and a program addressing security and crime prevention at the apartment complex.

h. Rental Preferences and Priority.

i. Veteran Preference. To the extent permitted by law, and provided that the prospective tenants meet standard screening standards, with respect to the rental of nineteen (19) of the units in the apartment complex, Applicant shall give a preference to households that include one or more veterans of the United States military.

ii. Local Preference. To the extent permitted by law, and provided that the prospective tenants meet standard screening standards, Applicant shall give a preference to households that include one or more persons who are currently employed in or are currently residing in the City of Los Alamitos.

22. The City Manager is authorized to approve and execute the regulatory agreement and any amendments thereto on behalf of the City. The City Manager shall have the authority to make approvals, issue interpretations, waive provisions, make and execute further agreements and/or enter into amendments to the regulatory agreement on behalf of City.

23. The Applicant shall reimburse the City for its reasonable costs to implement the Affordable Housing/Density bonus conditions of approval, and for the fees and costs charged for the services of attorneys and/or other professional third-party consultants engaged by the City to provide consultation, advice, analysis, and/or review or preparation of documents in connection with preparation of the regulatory agreement, review of the initial marketing and management plan required as part of the regulatory agreement, review of annual compliance reports submitted by Applicant pursuant to a regulatory agreement, and inspections and audits provided for in the regulatory agreement.

CONDITIONS, COVENANTS & RESTRICTIONS (CC&Rs)

24. Prior to the approval of the final map, all organizational documents for the Project, including any covenants, conditions, and restrictions (CC&Rs), shall be submitted to and approved by the Development Services Department and City Attorney's Office. Costs for such review shall be borne by the subdivider.

25. CC&Rs submitted to the City for review shall contain a table itemizing each of the requirements identified herein and the page/paragraph where they are addressed in the CC&Rs.

26. The approved CC&Rs shall be recorded with County Recorder's Office concurrent with the Final Map. A copy of the final documents shall be submitted to the Development Services Department after recordation.

27. No dwelling unit in the market-rate portion of the development shall be sold or a certificate of occupancy issued, unless a homeowners association has been legally formed with the right to assess all units which are jointly owned or benefitted to operate and maintain all other mutually available features of the development including, but not limited to, public and private open space, amenities, landscaping, private streets, and utilities.

28. The CC&Rs shall include, but are not limited to, the following provisions:

    a. The City shall be included as a party to the CC&Rs for enforcement purposes of those CC&R provisions in which the City has interest as reflected in the following provisions. However, the City shall not be obligated to enforce the CC&Rs.

    b. The requirement that association bylaws be established.

    c. Provisions for effective establishment, operation, management, use, repair, and maintenance of all common areas and facilities including open space, landscaped areas, roof decks, walls and fences, private roadways (i.e., walkways, sidewalks, paseos, driveways), lighting, and furnishings, awnings, trash enclosures, water quality management plan BMPs and private utilities, if any, shall be established in the CC&Rs.

    d. Private open space areas within the common area shall be illustrated on a "Private Open Space Exhibit" and shall be made part of the CC&Rs and shall specify those portions of the open space area that are allocated for private use. The CC&Rs shall include provisions for authorized uses and structures, access, maintenance, and restrictions in the private use areas to minimize noise and light disruptions to adjacent properties.

    e. Membership in the homeowners association shall be inseparable from ownership in individual units.

    f. Architectural controls shall be provided and may include, but not be limited to, provisions regulating architectural features, exterior finishes, roof materials, fences and walls, balconies, roof decks, accessory structures such as patios, sunshades, trellises, gazebos, awnings, exterior mechanical equipment, television and radio antenna, consistent with the Los Alamitos Municipal Code (LAMC).

    g. Maintenance standards shall be provided for applicable items listed in Section (c) above in the CC&Rs. Examples of maintenance standards are shown below.

        i. All common area landscaping and private areas visible from any public way shall be properly maintained such that they are evenly cut, evenly edged, and free of debris and weeds. All trees and shrubs shall be trimmed so they do not impede vehicular or pedestrian traffic. Trees shall be pruned so they do not intrude into neighboring properties and shall be maintained so they do not have droppings or create other nuisances to neighboring properties. All trees shall also be root pruned to eliminate exposed surface roots and damage to sidewalks, driveways, and structures.

ii. All private drives, sidewalks, and open space areas shall be maintained so that they are safe for users. Significant pavement cracks, pavement distress, excessive slab settlement, abrupt vertical variations, and debris on travel ways shall be removed or repaired promptly.

iii. Common areas shall be maintained in such a manner as to avoid the reasonable determination of a duly authorized official of the City that a public nuisance has been created by the absence of adequate maintenance such as to be detrimental to public health, safety, or general welfare.

h. Homeowners association approval of exterior improvements requiring a building permit shall be obtained prior to requesting a building permit from the City of Los Alamitos Development Services Department. All plans for exterior improvements shall conform to requirements set forth by the City and the CC&Rs.

i. A "Parking and Circulation Exhibit" shall be made part of the CC&Rs and shall be enforced by the homeowners association. In addition to the exhibit, provisions regarding parking shall be included in the CC&Rs, including the following:

    i. Residents shall not store or park any non-motorized vehicles, trailers or motorized vehicles that exceed seven (7) feet high, seven (7) feet wide, and nineteen (19) feet long in any parking space, driveway, or private street area except for the purpose of loading, unloading, making deliveries or emergency repairs except that the homeowners association may adopt rules and regulations to authorize exceptions.

    ii. Residents shall park vehicles in garage spaces. Storage of personal items may occur in the garages only to the extent that vehicles may still be parked within the required garage spaces.

    iii. The homeowners association shall be responsible for monitoring and enforcing all parking regulations on private property. The proposed CC&Rs shall include provisions requiring the association to develop and adopt an enforcement program for parking regulations within the development which may include measures for fire access and enforcement by a private security company.

j. Provisions for enforcing individual trash cart placement at designated curb areas as shown on the approved "Trash Pick-up Plan" no earlier than noon (12:00 P.M.) on the day before scheduled collections and removed within twelve (12) hours of collection.

k. Maintenance of all common areas, driveways, etc., shall be by the homeowners association.

l. Television and radio antennas shall be installed in accordance with the requirements of the LAMC.

m. All utility services serving the site shall be installed and maintained underground pursuant to LAMC 16.12.170.

n. The homeowners association shall be required to file the names, addresses, and telephone numbers of at least one (1) member of the homeowners association Board and, where applicable, a manager of the project before January 1st of each year with the Development Services Department for the purpose of contacting the association in the case of emergency or in those cases where the City has an interest in CC&R violations.

o. The homeowners association shall be responsible for establishing and following procedures for providing access to public utilities for maintenance of their facilities within the project area, subject to those agencies' approval.

p. No amendment to alter, modify, terminate, or change the homeowners association's obligation to maintain the common areas and the project perimeter wall or other CC&R provisions in which the City has an interest, as noted above, or to alter, modify, terminate, or change the City's right to enforce maintenance of the common areas and maintenance of the project perimeter wall, shall be permitted without the prior written approval of the Development Services Department.

FEES

29. In accordance with Government Code section 66477 and Chapter 16.18 of the Los Alamitos Municipal Code, the Applicant shall be required to pay **$3,333,905.00** in parkland dedication (Quimby) fees prior to the final certificate of occupancy issued for the Project.

CONSTRUCTION

30. The Applicant shall deliver a construction schedule to the adjacent properties within 300 feet of the site to properly inform them of future construction, including the name and 24-hour contact information for a project manager for noise, dust, and other complaints.

31. All demolition and construction shall be done in accordance with Los Alamitos Municipal Code Demolition Chapter 8.13.

32. The Applicant must comply with all current California Building Codes and California Residential Codes, as applicable.

33. Project plans for the condominium development shall be subject to a complete code compliance review with the Development Services Department when the condominium plans are submitted for plan check and shall comply with all applicable City of Los Alamitos ordinances, regulations, and policies prior to building permit issuance, including, but not limited to, the requirements established or authorized by Title 15, 16, and 17 of the City of Los Alamitos Municipal Code.

34. The site shall be kept reasonably clean during construction and maintained in a safe, nuisance, and hazard-free condition. Dust control measures shall be employed to include spraying water on dry soil to ensure dust does not migrate onto adjacent properties.

35. During construction the site shall be maintained and kept clear of all trash, weeds, and overgrown vegetation.

36. Prior to demolition and construction, a temporary perimeter security fence not exceeding eight feet in height shall be installed around the project site to secure the site and shield the construction areas and public views. The fencing shall include a privacy screen material or approved equivalent. The fence/screen material shall be properly maintained and be free of rips, tears, fraying, graffiti, and any other damage or vandalism.

37. The Applicant will display a sign visible to the public with a 24-hour emergency contact number for an individual, such as the construction superintendent, should any resident have any questions about the construction.

38. The Project shall comply with all requirements of Chapter 17.20, Noise, of the Los Alamitos Municipal Code.

39. Noise sources associated with construction activities shall only occur between the hours of 7:00 a.m. and 8:00 p.m. on weekdays and on Saturdays and shall not take place at any time on Sundays or Federal holidays.

40. All construction vehicles or equipment, fixed or mobile, operated within 1,000 feet of an existing dwelling shall be equipped with properly operating and maintained mufflers.

WQMP

41. Prior to issuance of any building permits, the Applicant shall submit to the City's Water Quality Manager for review and approval a *Final* Water Quality Management Plan (WQMP). The reviewed and approved WQMP shall be recorded and a copy of the recorded WQMP shall be provided to the City's Water Quality Manager. See also Condition No. 85.

LANDSCAPE

42. A landscape Irrigation Plan prepared by a licensed landscape architect shall be submitted to the Development Services Department prior to the issuance of building permits. The Irrigation Plan shall include an irrigation system layout with the location of controllers and points of connection with data on valve sizes and gallons per minute (G.P.M.), the size and location of sleeves and all spray heads, including the location of conventional systems and drip systems; an irrigation legend with complete specifications; irrigation notes and construction details of all assemblies and components; a recommended irrigation schedule, preferably on an annual basis; and a summary block on the initial page of submitted plans that will present the above information clearly and accurately. The City reserves the right to require subsequent checks, or approval of the landscape plans prior to issuance of a grading permit. See also Condition Nos. 66 and 67.

43. Landscaping shall comply with the City's water conservation ordinances in accordance with Chapter 13.04 (Water Conservation) and Chapter 13.05 (Water Efficient Landscaping) of the Los Alamitos Municipal Code.

44. A phased landscape and irrigation plan shall be submitted for review and comply with the City's Xeriscape Ordinance (Ord. No. 563). All required landscaping and irrigation shall be installed prior to the issuance of a certificate of occupancy for each corresponding phase.

45. All trees noted on the plans shall be planted outside of the Sight Safety Triangle or else be trimmed to eight feet in height from above the adjacent top of curb.

46. All landscaping on the site, including, without limitation, trees, shrubs and other vegetation, drainage and irrigation systems, shall be permanently maintained in good, first-class condition, healthy, without deterioration, free of waste and debris, through all phases of construction and after. Dead or diseased plants shall be promptly replaced with landscaping

similar in type, size, and quality. Automatic Irrigation systems shall be properly maintained, and other reasonable and adequate landscape maintenance facilities and procedures shall be provided to fulfill the foregoing requirements.

47. The common open space area improvements shall be reviewed for consistency with the Project plans by the Development Services Department prior to issuance of building permits. The common open space area identified as the "Neighborhood Green Space" on the Site Plan included as Figure 3-4 in the Draft EIR and centrally located within the Project site shall be completed at the time that the Applicant completes no more than 50 percent of the units (123 units).

LIGHTING

48. Prior to permit issuance Applicant shall submit a lighting plan to the Development Services Department to the satisfaction of the Development Services Director.

49. The Applicant shall provide adequate exterior lighting for each residential unit that maintains performance standards as described in Chapter 8.48 *Lighting Performance Standards* in the Los Alamitos Municipal Code. All lighting structures shall be placed so as to confine direct rays to the subject property.

50. The Applicant shall provide an illuminated uniform address number installed at each unit entryway.

UTILITIES

51. The Applicant shall submit detailed plans showing the proposed location of utilities and mechanical equipment to the Development Services Department for review and approval prior to the Building and Safety Division Plan check.

52. Above ground utility equipment (e.g., electrical, telephone, and cable TV) shall be screened if located in the front yard area of each unit, within the front yard setback, common open space area, or any parking spaces or sidewalks, and shall be screened to the satisfaction of the Development Services Director.

53. All exterior mechanical equipment shall be screened from view.

54. All utility meters, when not enclosed in a cabinet, shall be screened from view from any place on or off site, by either plant materials or decorative screen, while allowing sufficient access for reading.

SIGNAGE

55. All tract name signage at entry points to the project site shall be subject to the discretion and approval of the Development Services Director.

PARKING

56. Applicant shall construct and maintain at all times a minimum of 577 parking spaces on the combined parcels and a minimum nine (9) foot by nineteen (19) foot dimension per parking space with minimum drive aisle widths of twenty-four (24) feet.

57. Wheel stops/blocks or curbs as wheel stops shall be required for all parking spaces on exterior parking spaces as shown on the Project site plans.

58. All units with a garage shall maintain within the garage the ability to park cars at all times. Garages shall not be converted to any other use.

59. There shall be no business activities or day care conducted within or from the garages.

60. Residents shall not park or store vehicles anywhere on the site except within the designated parking spaces in the garage or driveways for their unit. However, the open parking spaces, located along the private driveways, may be utilized for residents or guest for temporary parking. Any issues arising from the use, application, or restriction of such open parking spaces shall be resolved by the Homeowner's Association.

TRASH

61. Except as required for CC&Rs per Condition 28.j, Applicant shall design the refuse and recycling storage area in accordance with Section 17.16.090 of the Los Alamitos Municipal Code as applicable.

OTHER

62. Each residence shall be utilized as one (1) dwelling unit. No portion of any residence shall be utilized or rented as a separate dwelling unit.

63. The block wall on the south parcel line of the proposed Project that separates the Project from Lampson Avenue shall be 7 feet tall as measured from the exterior of the parcel and painted white.

MITIGATION MOINTORING AND REPORTING PLAN (MMRP)

Project Design Features (PDFs)

64. PDF AQ-1 - The Project will utilize Tier 4 Interim construction equipment during construction activities.

65. PDF B-1 - Pursuant to Figure 3-18, Landscape Plan, the Project will incorporate larger sized box tree species (including the western sycamore and cottonwood trees) that foliage specialist bats prefer and will plant the trees on the fringes of the development, adjacent to open space areas.

66. PDF B-2 - Pursuant to Figure 3-18, Landscape Plan, the Project will plant approximately 441 trees onsite (excluding shrubs and ground cover), including the western sycamore (Platanus racemosa), paperbark melaleuca (Melaleuca quinquenervia), olive (Olive sp.), southern

magnolia (Magnolia grandiflora), Crape myrtle (Lagerstroemia indica), Brisbane box (Lophostemon confertus), Australian willow (Geijera parviflora), Italian cypress (Cupressus sempervirens), yew pine (Podocarpus macrophyllus) and other species. No plants listed on the California Invasive Plant Council (Cal-IPC)6 Inventory species will be planted and a list of approved species to planted shall be reviewed by a qualified biologist prior to planting.

67. PDF GHG-1 - The Project will include solar photovoltaic panels with the capability to generate up to 1,229,520 kWh/annually.

68. PDF GHG-2 - The Project will be 100% electric and will not include natural gas.

69. PDF GHG-3 - The Project will provide a community electric vehicle for the affordable housing component for residents to drive short distance trips to the local grocery store.

70. PDF GHG-4 - The Project's affordable apartment parking areas will be designed to provide electric vehicle (EV) charging stations. At minimum, the number of EV charging stations will equal the Tier 2 Residential Voluntary Measures of the California Green Building Standards Code, Section A4.106.8.2.1.

71. PDF HYD-1 - The Project will be built such that the finished floor elevation for the onsite buildings is set 1 foot minimum above the peak 100-year storm event water surface elevation in accordance with Orange County Flood Protection Requirements.

72. PDF N-1 - Prior to the issuance of occupancy permits, the Project will construct a 7-foot-high noise barrier along Lampson Avenue. The noise control barrier will be constructed so that the top of each wall and /or berm combination extends to the planned height above the pad elevation of the lot it is shielding. Since the pad elevations varies, the top of each wall and/or berm combination will be 7' above each applicable pad elevation. When the roadway or terrain is elevated above the pad elevation, the barrier shall extend to the recommended height above the highest point between the residential home and the roadway. The barrier shall be built with a material surface weight of at least 4 pounds per square foot, with no decorative cutouts, perforations, or line-of-sight openings between residences and Lampson Avenue. The noise barrier shall be constructed using the following materials:

    - Masonry block;
    - Stucco veneer over wood framing (or foam core), or 1-inch-thick tongue and groove wood of at least four pounds per square foot;
    - Material with sufficient weight per square foot capable of providing a minimum transmission loss of 20 dBA;
    - Earthen berm; or,
    - Any combination of these construction materials.

73. PDF N-2 - To comply with the State of California and City of Los Alamitos 45 A-weighted Decibels (dBA) Community Noise Equivalent Level (CNEL) interior noise standards for residential land use, the Project will provide the following or equivalent noise abatement measures on building plans:

    - Windows & Glass Doors: At a minimum the Project will provide windows and glass doors that are well-fitted, well-weather-stripped assemblies with minimum sound transmission class (STC) ratings of 27. Additionally, all second-floor facades adjacent to Lampson

Avenue and JFTB Los Alamitos will be provided windows and glass doors that are well-fitted, well-weathers-tripped assemblies with minimum sound transmission class (STC) ratings of 29.

- Doors (Non-Glass): All exterior doors shall be well weather-stripped and have Well-sealed perimeter gaps around the doors are essential to achieve the minimum STC rating.
- Walls: At any penetrations of exterior walls by pipes, ducts, or conduits, the space between the wall and pipes, ducts, or conduits shall be caulked or filled with mortar to form an airtight seal.
- Roof: Roof sheathing of wood construction shall be per manufacturer's specification or caulked plywood of at least one-half inch thick. Ceilings shall be per manufacturer's specification or well-sealed gypsum board of at least one-half inch thick. Insulation with at least a rating of R-19 shall be used in the attic space.
- Ventilation: Arrangements for any habitable room shall be such that any exterior door or window can be kept closed when the room is in use and still receive circulated air. A forced air circulation system (e.g. air conditioning) or active ventilation system (e.g. fresh air supply) shall be provided in compliance with applicable State and local Building Codes (e.g. California Building Code, Chapter 3, R338.3).

Mitigation Measures (MMs)

74. MM 4.3-1 - Vegetation clearing should be conducted outside of the nesting season (February 1 through September 15). If avoidance of the nesting season is not feasible, then a qualified biologist shall conduct a pre-construction nesting bird survey within three days prior to any disturbance to the Project site. Site disturbance includes disking, demolition activities, vegetation removal and grading. If active nests are identified, the biologist shall establish appropriate avoidance buffers around the nest (based on the species detected), and the buffer areas shall be avoided until the nests are no longer occupied (through routine nest monitoring by the qualified biologist) and the juvenile birds can survive independently from their nest(s). In addition, if portions of the Project site have not been disturbed within three days after the initial nesting bird survey, additional nesting bird surveys will be conducted (within the nesting bird season, February 1 to September 15) until all portions of the Project site have been disturbed appropriately (as determined by a qualified biologist) as to not provide potential nesting habitat.

75. MM 4.3-2 - If tree removal or ground disturbance occurs during the raptor nesting season (from approximately January 1 to July 31), pre-removal/disturbance surveys shall be conducted. The surveys shall include areas of suitable nesting trees within 300-feet from the limits of disturbance (to the extent that access is available). The survey shall be conducted no more than three days prior to disturbance. Should nesting raptors be detected either onsite or offsite, work would be delayed until fledglings have left the nest and area no longer dependent on the nest at which time, work could proceed.

76. MM 4.3-3 - A qualified biologist shall conduct a pre-construction bat roost survey for roosting bats no more than 14 days prior to site disturbance. The pre-construction bat roost survey will consist of a minimum of two bat surveys (conducted consecutively or as determined by the biologist). If roosting bats are detected onsite outside of the bat maternity season, the roost tree will be removed in a manner to avoid and/or minimize injury to roosting bats. This may

include using mechanical equipment to gently nudge the tree trunk multiple times prior to removal or for palm trees and other species, to de-frond or de-branch the tree using a mechanical lift and gently lower the cut branches to the ground. Regardless of the method, the fallen tree and/or material will be left undisturbed overnight until at least the next morning to give roosting bats time to exit before site disturbance.

If roosting bats are detected onsite during the maternity season, the Project shall avoid the subject roost(s) and incorporate an avoidance buffer (as determined by a qualified biologist) until after the maternity season or until a qualified biologist determines no maternity roosting is occurring. Once the qualified biologist approves removal of the subject roost tree(s), the same tree removal procedures as outlined above shall be implemented prior to tree removal.

77. MM 4.4-1 - Discovery of Inadvertent Resources. Prior to the issuance of any grading permits, the Applicant shall submit proof that a qualified consulting archaeologist meeting the Secretary of Interior's (36 CFR 61) Professional Qualifications Standards has been retained to conduct periodic spot checks during ground disturbing activities. Spot check should occur at initial ground exposure within the project; upon a 50 percent completion milestone of ground disturbance; upon an 80 percent milestone of ground disturbance; or at any other time determined necessary by the consulting archaeologist. If any potentially historic or archaeological resources are encountered during ground-disturbing activities, the archaeologist shall halt construction work within 50 feet of the find and assess the nature of the find for importance.

    a) If the discovery is determined to not be important by the archaeologist (e.g. isolates and clearly non-significant deposits), work will be permitted to continue in the area. If a find is determined to be potentially important by the archaeologist, the Lead Agency shall be notified, and additional investigation would be required. Additional investigation work would include scientific recordation and, depending on the nature of the find, excavation.

    b) At the conclusion of ground disturbing activities, the archaeologist shall draft a report detailing the monitoring process and summarize any additional field study and analysis of resources, should any be discovered. The completed report shall be approved by the Planning Department and the Applicant shall provide verification that the report was submitted to the Lead Agency prior to the issuance of an occupancy permit.

    c) Excavated finds shall be curated at a repository determined by the archaeologist and approved by the City with verification provided to the City prior to the issuance of an occupancy permit.

78. MM 4.4-2 - Discovery of Human Remains. If human burial or skeletal remains are identified during excavation or construction, work in that location shall stop immediately until the find can be properly treated. The construction contractor would be required by law to comply with California Health and Safety Code Section 7050.5 “Disturbance of Human Remains.” The County Coroner must be contacted and if the Coroner recognizes the human remains to be those of a Native American or has reason to believe that they are those of a Native American, the Coroner is required to contact the Native American Heritage Commission (NAHC) by telephone within 24 hours. Once the NAHC receives notification of a discovery of Native American human remains from a county coroner, the NAHC is required to immediately notify those persons it believes to be most likely descended from the deceased Native American. The descendants may, with the permission of the owner of the land, or his or her authorized representative, inspect the Site of the discovery of the Native American human remains and

may recommend to the owner or the person responsible for the excavation work means for treatment or disposition, with appropriate dignity, of the human remains and any associated grave goods. The descendants shall complete their inspection and make recommendations or preferences for treatment within 48 hours of being granted access to the site. According to Public Resources Code Section 5097.94(k), the NAHC is authorized to mediate disputes arising between landowners and known descendants relating to the treatment and disposition of Native American human burials, skeletal remains, and items associated with Native American burials.

79. MM 4.6-1 - Prior to the issuance of grading permits or building permits, the City of Los Alamitos Public Works & Engineering Department shall verify that all of the recommendations provided in Section 4.0 of the Project's December 21, 2021 "Preliminary Geotechnical Evaluation and Design Recommendations for Proposed Single-Family and Multi-Family Residential Development, 4665 Lampson Avenue, Los Alamitos, California," prepared by LGC Geotechnical, Inc. and included as Technical Appendix F1 to the Project's EIR, are incorporated into the Project's grading and building plans and implemented by the construction contractors. These recommendations include but are not limited to a) Site Earthwork Considerations; b) Preliminary Foundation Recommendations; c) Site Grading Recommendations; d) Soil Bearing and Lateral Resistance Considerations; e) Lateral Earth Pressures for Retaining Walls Considerations; f) Nonstructural Concrete Flatwork Recommendations; and g) Preliminary Asphalt Concrete Pavement Design Parameters. Alternatively, the Project shall comply with the findings and recommendations of any geotechnical studies that may be required in association with future grading and/or building permits.

80. MM 4.6-2 - If paleontological resources are discovered during earth disturbance activities, the discovery shall be cordoned off with a 50-foot radius buffer so as to protect the discovery from further potential damage, and an Orange County Certified Professional Paleontologist shall be consulted to assess the discovery.

    If the discovery is determined to be significant by the paleontologist, a monitoring and recovery plan shall be initiated, which will include notification of appropriate personnel involved and monitoring of earth disturbance activities.

    a) Monitoring of mass grading and excavation activities shall be performed by a qualified paleontologist or paleontological monitor. Monitoring will be conducted full-time in areas of grading or excavation in undisturbed sediments of alluvial deposits.

    b) Paleontological monitors will be equipped to salvage fossils as they are unearthed to avoid construction delays. The monitor must be empowered to temporarily halt or divert equipment to allow removal of fossils in a timely manner. Monitoring may be reduced if the potentially fossiliferous units are not present in the subsurface, or, if present, are determined upon exposure and examination by qualified paleontological personnel to have low potential to contain fossil resources. The monitor shall notify the project paleontologist, who will then notify the concerned parties of the discovery.

    c) Paleontological salvage during trenching and boring activities is typically from the generated spoils and does not delay the trenching or drilling activities. Fossils will be collected and placed in cardboard flats or plastic buckets and identified by field number, collector, and date collected. Notes will be taken on the map location and stratigraphy of the site, which is photographed before it is vacated, and the fossils are removed to a safe

place. If the site involves remains from a large terrestrial vertebrate, such as large bone(s) or a mammoth tusk, that is/are too large to be easily removed by a single monitor, a fossil recovery crew shall excavate around the find, encase the find within a plaster and burlap jacket, and remove it after the plaster is set. For large fossils, use of the contractor's construction equipment may be solicited to help remove the jacket to a safe location.

d) Recovered specimens will be prepared to a point of identification and permanent preservation (not display), including screen-washing sediments to recover small invertebrates and vertebrates.

e) Recovered specimens shall be identified and curated of specimens into a professional, accredited public museum repository with a commitment to archival conservation and permanent retrievable storage (e.g., OC Parks). The paleontological program should include a written repository agreement prior to the initiation of monitoring activities. Prior to curation, the lead agency (e.g., the City of Los Alamitos) will be consulted on the repository/museum to receive the fossil material.

f) A final report of findings and significance will be prepared, including lists of all fossils recovered and necessary maps and graphics to accurately record their original location(s). The report, when submitted to, and accepted by, the appropriate lead agency, will signify satisfactory completion of the project program to reduce impacts to any potential nonrenewable paleontological resources (i.e., fossils) that might have been lost or otherwise adversely affected without such a program in place.

81. MM 4.15-1 - Prior to the issuance of certificate of occupancy, the project applicant shall provide documentation that it has implemented the CAPCOA strategies identified below. Verification that the CAPCOA strategies were completed shall be verified by the City's Public Works Director.

    1. Provide pedestrian and bicycle network improvements within the development connecting to existing off-site facilities, as detailed in Section 3.3.2 of this EIR.

    2. Confirm with the OCTA whether providing new or re-routing existing transit services to the site would be feasible, as determined by OCTA pursuant to OCTA's standards.

    3. Install broadband infrastructure or other communication technologies that encourages telecommuting and working from home, which would reduce mobile source emission.

82. MM 4.16-1 - <u>Retain a Native American Monitor Prior to Commencement of Ground-Disturbing Activities</u>.

    1. The project applicant/lead agency shall retain a Native American Monitor from or approved by the Gabrieleño Band of Mission Indians – Kizh Nation. The monitor shall be retained prior to the commencement of any "ground-disturbing activity" for the subject project at all project locations (i.e., both on-site and any off-site locations that are included in the project description/definition and/or required in connection with the project, such as public improvement work). "Ground disturbing activity" shall include, but is not limited to, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching.

    2. A copy of the executed monitoring agreement shall be submitted to the lead agency prior to the earlier of the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence a ground-disturbing activity.

3. The monitor will complete daily monitoring logs that will provide descriptions of the relevant ground-disturbing activities, the type of construction activities performed, locations of ground disturbing activities, soil types, cultural-related materials, and any other facts, conditions, materials, or discoveries of significance to the Tribe. Monitor logs will identify and describe any discovered TCRs, including but not limited to, Native American cultural and historical artifacts, remains, places of significance, etc., (collectively, tribal cultural resources, or "TCR"), as well as any discovered Native American (ancestral) human remains and burial goods. Copies of monitor logs will be provided to the project applicant/lead agency upon written request to the Tribe.

4. On-site tribal monitoring shall conclude upon the latter of the following (1) written confirmation to the Kizh from a designated point of contact for the project applicant/lead agency that all ground-disturbing activities and phases that may involve ground-disturbing activities on the project site or in connection with the project are complete; or (2) a determination and written notification by the Kizh to the project applicant/lead agency that no future, planned construction activity and/or development/construction phase at the project site possesses the potential to impact Kizh TCRs.

5. Upon discovery of any TCRs, all construction activities in the immediate vicinity of the discovery shall cease (i.e., not less than the surrounding 50 feet) and shall not resume until the discovered TCR has been fully assessed by the Kizh monitor and/or Kizh archaeologist. The Kizh will recover and retain all discovered TCRs in the form and/or manner the Tribe deems appropriate, in the Tribe's sole discretion, and for any purpose the Tribe deems appropriate, including for educational, cultural and/or historic purposes.

83. MM 4.16-2 - Unanticipated Discovery of Human Remains and Associated Funerary Object.

1. Native American human remains are defined in PRC 5097.98 (d)(1) as an inhumation or cremation, and in any state of decomposition or skeletal completeness. Funerary objects, called associated grave goods in Public Resources Code Section 5097.98, are also to be treated according to this statute.

2. If Native American human remains and/or grave goods discovered or recognized on the project site, then all construction activities shall immediately cease. Health and Safety Code Section 7050.5 dictates that any discoveries of human skeletal material shall be immediately reported to the County Coroner and all ground-disturbing activities shall immediately halt and shall remain halted until the coroner has determined the nature of the remains. If the coroner recognizes the human remains to be those of a Native American or has reason to believe they are Native American, he or she shall contact, by telephone within 24 hours, the Native American Heritage Commission, and Public Resources Code Section 5097.98 shall be followed.

3. Human remains and grave/burial goods shall be treated alike per California Public Resources Code section 5097.98(d)(1) and (2).

4. Construction activities may resume in other parts of the project site at a minimum of 200 feet away from discovered human remains and/or burial goods, if the Kizh determines in its sole discretion that resuming construction activities at that distance is acceptable and provides the project manager express consent of that determination (along with any other mitigation measures the Kizh monitor and/or archaeologist deems necessary). (CEQA Guidelines Section 15064.5(f).)

5. Preservation in place (i.e., avoidance) is the preferred manner of treatment for discovered human remains and/or burial goods. Any historic archaeological material that is not Native American in origin (non-TCR) shall be curated at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes.

6. Any discovery of human remains/burial goods shall be kept confidential to prevent further disturbance.

84. MM 4.16-3 - Procedures for Burials and Funerary Remains.

1. As the Most Likely Descendant ("MLD"), the Koo-nas-gna Burial Policy shall be implemented. To the Tribe, the term "human remains" encompasses more than human bones. In ancient as well as historic times, Tribal Traditions included, but were not limited to, the preparation of the soil for burial, the burial of funerary objects with the deceased, and the ceremonial burning of human remains.

2. If the discovery of human remains includes four or more burials, the discovery location shall be treated as a cemetery and a separate treatment plan shall be created.

3. The prepared soil and cremation soils are to be treated in the same manner as bone fragments that remain intact. Associated funerary objects are objects that, as part of the death rite or ceremony of a culture, are reasonably believed to have been placed with individual human remains either at the time of death or later; other items made exclusively for burial purposes or to contain human remains can also be considered as associated funerary objects. Cremations will either be removed in bulk or by means as necessary to ensure complete recovery of all sacred materials.

4. In the case where discovered human remains cannot be fully documented and recovered on the same day, the remains will be covered with muslin cloth and a steel plate that can be moved by heavy equipment placed over the excavation opening to protect the remains. If this type of steel plate is not available, a 24-hour guard should be posted outside of working hours. The Tribe will make every effort to recommend diverting the project and keeping the remains in situ and protected. If the project cannot be diverted, it may be determined that burials will be removed.

5. In the event preservation in place is not possible despite good faith efforts by the Applicant, before ground-disturbing activities may resume on the project site, the landowner shall arrange a designated site location within the footprint of the project for the respectful reburial of the human remains and/or ceremonial objects.

6. Each occurrence of human remains and associated funerary objects will be stored using opaque cloth bags. All human remains, funerary objects, sacred objects and objects of cultural patrimony will be removed to a secure container on site if possible. These items should be retained and reburied within six months of recovery. The site of reburial/repatriation shall be on the project site but at a location agreed upon between the Tribe and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered.

7. The Tribe will work closely with the project's qualified archaeologist to ensure that the excavation is treated carefully, ethically, and respectfully. If data recovery is approved by the Tribe, documentation shall be prepared and shall include (at a minimum) detailed

descriptive notes and sketches. All data recovery data recovery-related forms of documentation shall be approved in advance by the Tribe. If any data recovery is performed, once complete, a final report shall be submitted to the Tribe and the NAHC. The Tribe does NOT authorize any scientific study or the utilization of any invasive and/or destructive diagnostics on human remains.

NPDES

85. Prior to the issuance of any building permits, the Applicant shall submit to the City for review and approval a *Final* Water Quality Management Plan (WQMP) that:
    - Addresses Site Design BMPs (Best Management Practices) such as minimizing impervious areas, maximizing permeability, minimizing directly connected impervious areas, creating reduced or "zero discharge" areas, and conserving natural areas.
    - Incorporates the applicable Routine Source Control BMPs as defined in the DAMP.
    - Incorporates Treatment Control BMPs as defined in the DAMP.
    - Generally describes the long-term operation and maintenance requirements for the Treatment Control BMPs.
    - Identifies the entity that will be responsible for long-term operation and maintenance of the Treatment Control BMPs.
    - Describes the mechanism for funding the long-term operation and maintenance of the Treatment Control BMPs.

86. Prior to issuance of any Grading or Building Permit and as part of the future development's compliance with the NPDES requirements the Applicant shall enroll electronically through the SMARTS program to comply with the State of California General Construction Permit. Proof of enrollment must be submitted to the City of Los Alamitos before issuance of grading or building permits. Also, a Stormwater Pollution Prevention Plan (SWPPP) shall be reviewed and approved by the Director of Public Works and the City Engineer for water quality construction activities on-site. A copy of the SWPPP shall be available and implemented at the construction site at all times. The SWPPP shall outline the source control and/or treatment control BMPs to avoid or mitigate runoff pollutants at the construction site to the "maximum extent practicable".

87. Prior to obtaining grading permits, the Applicant shall submit a Stormwater Pollution Prevention Plan (SWPPP) for review and approval by the Building and Safety Division.

88. Prior to issuance of any Grading Permit, the Director of Public Works and the Building Official shall confirm the Grading Plan specifications stipulate, in compliance with SCAQMD Rule 403, excessive fugitive dust emissions shall be controlled by regular watering or other dust prevention measures as specified in the SCAQMD's Rules and Regulations. In addition, SCAQMD Rule 402, requires implementation of dust suppression techniques to prevent fugitive dust from creating a nuisance off-site. Implementation of the following measures would reduce short-term fugitive dust impacts on nearby sensitive receptors:
    - All active portions of the construction site shall be watered twice daily to prevent excessive amounts of dust;

- On-site vehicle speed shall be limited to 15 miles per hour;
- All on-site roads shall be paved as soon as feasible, watered twice daily, or chemically stabilized;
- Visible dust beyond the property line which emanates from the project shall be prevented to the maximum extent feasible;
- All material transported off-site shall be either sufficiently watered or securely covered to prevent excessive amounts of dust prior to departing the job site; Track-out devices shall be used at all construction site access points; and
- All delivery truck tires shall be watered down and/or scraped down prior to departing the job site.

89. All trucks that are to haul excavated or graded material onsite shall comply with State Vehicle Code Section 23114 (Spilling Loads on Highways), with special attention to Sections 23114(b)(F) and (e)(4) as amended, regarding the prevention of such material spilling onto public streets and roads. Prior to the issuance of grading permits, the Applicant shall demonstrate to the City of Los Alamitos how the project operations subject to that specification during hauling activities shall comply with the provisions set forth in Sections 23114(b)(F) and (e)(4).

ORANGE COUNTY FIRE AUTHORITY (OCFA)

90. PR105 - Conditional Use Permit (Conditions of Approval)

The Applicant or responsible party shall submit the plan(s) listed below to the Orange County Fire Authority for review. Approval shall be obtained on each plan before the event specified.

1. As previously requested, provide a completed Water Availability Form, signed by a representative of the local water purveyor, showing the results of a recent fire hydrant flow test (within 6 months).
2. The site plan shall meet minimum requirements per OCFA Guideline B-01.
3. As previously requested, stated per OCFA Guideline B-01 Fire department access shall be available during the entire trajectory of the project. A phasing plan may be proposed under an AM&M. The plans were reviewed based on a single owner of the property. Per our discussion, the lot will be split and divided among more than one owner. Easement Agreements shall be approved and recorded before Fire Master Approval.
4. Prior to OCFA clearance of a final map or issuance of a precise grading permit or a building permit, if a grading permit is not required:

   * fire master plan (service code PR145)

5. Prior to issuance of a building permit:

   * Architectural (service codes PR200-PR285)

   * underground piping (service code PR470-PR475)

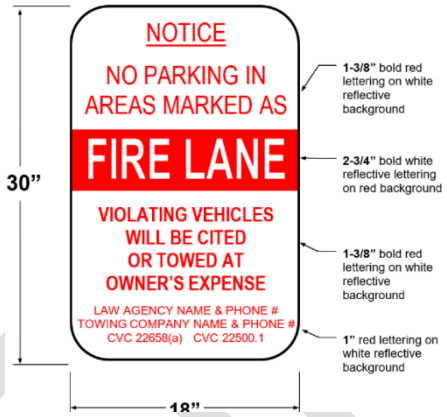
   * fire sprinkler system (service codes PR400-PR465)

6. Prior to concealing interior construction:

   * fire alarm system (service code PR500-PR530)

Temporary/Final Occupancy Inspections:

7. Prior to issuance of a temporary or final certificate of occupancy, all OCFA inspections shall be completed to the satisfaction of the OCFA inspector and be in substantial compliance with codes and standards applicable to the project and commensurate with the type of occupancy (temporary or final) requested. Inspections shall be scheduled at least five days in advance by calling OCFA Inspection Scheduling at 714-573-6150.



91. PR110 - Tentative Tract Map "B" and Fire Master Plan

As previously indicated, the proposed site plans do not meet minimum fire department access. Please see the redlined tentative track map for reference. These design issues will need to be resolved prior to submittal/approval of the B Map and/or f the Fire Master Plan.

a. As previously requested, fire department lanes shall be deciphered on the Track Map by shading the minimum 20' width. See redline item #1.

b. All entry signs shall be per OCFA Guideline B-0, Figure 6-Fire Lane Entrance Signs. See redline item #2.

Figure 6 – Fire Lane Entrance Signs

All portions of the buildings are within 150 feet of the public road as measured along the path of firefighter travel. All starting points for the hose pull shall be at the fire department access road. See redline item #3.

The plans have not been reviewed for Vehicular Gates. Obstructions to Emergency Vehicle Access shall meet minimum requirements per OCFA Guideline B-01Section B1. Reference redline item #4.

Required Fire Department Fire Access Road less than 36 ft. shall require signage on one or both sides of the road. See detail #6.

92. The Applicant shall enter into a Secured Fire Protection Agreement (SFPA) to provide for fair-share funding of capital improvements necessary to establish adequate fire protection facilities and equipment, and/or personnel. The SFPA would ensure that responses times and service ratios are met due to the implementation of the Project and no new fire station facilities would be required.

ENGINEERING / PUBLIC WORKS

93. A City public works encroachment permit shall be obtained for all work in public right-of-way before starting work. All work shall be done in accordance with APWA Standards and to the satisfaction of the City Engineer and must be completed before issuance of Certificate of Occupancy.

94. A bond or surety device shall be posted with the City in an amount and type sufficient to cover the amount of off-site and on-site work to be done, as approved by the City Engineer.

95. Pad certification by the Design Civil Engineer and Soil Engineer is required prior to the commencement of structural construction.

96. The final compaction report prepared by a qualified Soil Engineer shall be submitted to the City Engineer for review and approval before the commencement of structural construction.

97. The Applicant shall submit a Geotechnical Report for review and approval and shall prepared by a licensed Soils Engineer.

98. Prior to the issuance of any building permits, the Applicant shall provide to the City a Final Water Quality Management Plan (WQMP) that:

    - Addresses Site Design BMPs (Best Management Practices) such as minimizing impervious areas, maximizing permeability, minimizing directly connected impervious areas, creating reduced or “zero discharge” areas, and conserving natural areas.
    - Incorporates the applicable Routine Source Control BMPs as defined in the DAMP.
    - Incorporates Treatment Control BMPs as defined in the DAMP.
    - Generally describes the long-term operation and maintenance requirements for the Treatment Control BMPs.
    - Identifies the entity responsible for long-term operation and maintenance of the Treatment Control BMPs.
    - Describes the mechanism for funding the long-term operation and maintenance of the Treatment Control BMPs.

99. The Applicant shall submit Improvement Plans to a Registered Civil Engineer prepared for public works (off-site) and on-site improvements. Plan check fees shall be paid in advance.

100. An on-site grading and drainage plan shall be prepared and submitted to the City Engineer for approval. The plan shall be 24" x 36", with elevations to the nearest 0.01-foot, minimum scale 1" = 20'. Registered Civil Engineers shall prepare a plan. Public works improvements may be shown in this plan. Grading plan check fees must be paid in advance.

101. The Applicant shall submit a Drainage Report that shall contain Hydrologic and hydraulic calculations demonstrating adequate habitable onsite protection for the 100- year storm and street drainage assessing a 10-year return frequency storm (25-year frequency in sump

areas) prepared by a Registered Civil Engineer shall be submitted with the Grading Plan. Drainage Report shall be per the Orange County Hydrology Manual and the Orange County Local Drainage Manual as applicable.

102. Proposed Condition Drainage patterns are not to exceed the Existing Condition flow rates and must match the existing outlet locations. No net increase of flows will be allowed to enter Lampson Avenue or any other drainage conveyance without approval from the owner of the drainage facility.

103. The driveway and parking lot slope shall be a minimum slope of one 1.0% for asphalt and 0.5% for concrete.

104. Pursuant to and in accordance with Government Code Section 66020(d)(1), the Project Applicant is hereby notified as follows: The fees, dedications, reservations, and other exactions ("impositions") imposed on this development, and which are subject to notification pursuant to Government Code Section 66020(d)(1) are:

    Traffic Impact Fees: Yes, if you are increasing the total daily trips by 200 trips.

105. Provide a Traffic Impact Analysis for review and approval. Based on the review and approval of this analysis, additional conditions and/or fees may be required. Applicant is required to provide evidence to the Director of Development Services that the Applicant has conferred with the City of Seal Beach regarding the final Traffic Impact Analysis prior to issuance of grading permit.

106. All driveways, sidewalks and ADA Ramps shall meet current ADA requirements, and all offsite improvements are to be done per City Standards.

107. A new 5-foot-wide concrete sidewalk shall be installed to be contained within the entire Los Alamitos right of way.

108. A Sewer Will-Serve letter is required prior to approval of building permits. Applicant must coordinate with the City of Seal Beach and/or the Rossmoor Los Alamitos Sewer District (RLAASD) to secure a connection to the sanitary sewer system provided by either the City of Seal Beach or the Rossmoor/Los Alamitos Sewer District

109. In relation to sewer connections, preliminary plans with the proposed lateral connections must be submitted to the City of Seal Beach and/or the Rossmoor Los Alamitos Sewer District (RLAASD) to assess if plan check, inspection, and/or a sewer study is required. Approval of a sewer capacity study is required from the applicable sewer agency prior to issuance of a building permit.

110. All Project improvements (within the public right of way) shall comply with Los Alamitos and all other applicable standards to ensure all intersection sight distance, pedestrian/bike crossing facilities, and street design requirements are complied with.

111. Prior to importation onsite, the Project Applicant shall submit evidence to the Development Services Director that all imported fill materials have been tested and meet the regulatory screening levels.

Tom Oliver, Associate Planner
City of Los Alamitos Planning Division
3191 Katella Avenue
Los Alamitos, CA 90720

Dear Mr. Oliver,

On behalf of the Los Alamitos Unified School District, I would like to express our sincere appreciation for the continued collaboration between the City Council, the community, and the District in planning projects that support the growth and vitality of our community. We value the coordination and thoughtful dialogue that accompany these developments, which serve to strengthen our city and community.

I am writing today to offer the Los Alamitos Unified School District's support for the 4665 Lampson Avenue residential housing development. As a district committed to providing high-quality education for all students, we recognize that housing plays a critical role in fostering a stable and engaged community. This development will offer additional residential opportunities for families, professionals, and community members, all of whom contribute to the overall well-being of our city and its schools. By increasing access to affordable, safe, and attractive housing, this project will help attract and retain the diverse population essential for sustaining our local schools and businesses.

Over 80% of families in our district have shared that the quality of our schools is a primary reason for moving into this community. We are honored to provide a world-class education to the students and families of Los Alamitos, and we take great pride in maintaining the high standards that draw families to our district. However, like many districts across the state, we have experienced an enrollment decline, with our student population decreasing by nearly 8% over the past eight years. This decline has resulted in available classroom space at each of our campuses, leaving us well-positioned to accommodate any new students from this development. We look forward to welcoming new families to our award-winning district.

The District has taken proactive steps to plan for both current and future enrollment trends. We have engaged a professional demographer to guide us in making informed decisions regarding short- and long-term planning. Based on both internal data and the demographer's projections, our district is expected to

Board of Education: Megan Cutuli • Marlys Davidson • Scott Fayette • Chris Forehan • Diana D. Hill

see further declines in enrollment over the coming years. As such, we are eager to serve new families who choose to live in this community and benefit from the exceptional educational programs we offer.

Furthermore, we are pleased to learn that the 4665 Lampson Avenue Residential Project will prioritize affordable housing for individuals who work within the City of Los Alamitos. This is especially significant for our classified staff members, who may find this development an excellent opportunity to live in the same community they serve.

In conclusion, the Los Alamitos Unified School District fully supports the approval of the 4665 Lampson Avenue Residential Project. We appreciate the opportunity to provide input throughout this process and remain available to address any questions you may have regarding the project and its potential impact on our district.

We look forward to continuing to work in partnership with the city to create a thriving community where families and students can live, learn, and thrive.

Sincerely,

Meg Cutuli
Board President, Los Alamitos Unified School District

Hello,

My name is Asheena Lee. I am a resident of Parkewood in Los Alamitos. I have a few concerns about the Lampson project.

1. Please consider the dangerous increase in Uturns. We need a no Uturn sign and added lights to prevent mortality and morbidity.

2. Please request that they add more parking. Living in Parkewood I am aware of how quickly parking spaces fill up. We already have a problem with so many parked cars on the road it is often dangerous driving and walking. There are narrow passages with two-way traffic trying to get into a small space due to so many street vehicles. This will only be amplified if the Lampson project does not have appropriate parking. Parking garages or fewer units would help with this.

3. Please consider requiring a public park. We do not have many parks here, and the park we have is in seal beach. With adding so many residents, we will need a safe place for children to play. Parks decrease crime and increase the quality of life. Please consider requiring some of the land for a park for the children.

4. Consider keeping some of the land commercial. There is not much commerce on the street here. It may be a great place to keep a few units that could be used for small restaurants such as coffee shops, bakeries, or restaurants. This would bring further revenue to the city and reinvigorate the community.

Thank you,
Asheena Lee

Subject: housing development at Seal Beach/Lampson

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender lelisa_b@yahoo.com

Good evening,

As a 20-year resident of Rossmoor, I am concerned with the proposed housing development. My door faces Montecito Road, and I know from firsthand accounts of increased traffic on one of the main roads in Rossmoor. Not only has there been an increase in cars, but post-Covid, there has been a significant increase in electric bikes amongst the teens. And we now share the roads with them!

The housing development is sure to bring more traffic, air, and noise pollution. Increased population density is also correlated with an increase in crimes.

I greatly opposed the proposed developments.

Thank you in advance for your consideration in this matter.

Respectfully,
Lelisa Balderama

Subject: Lampson Park Place Comment

Dear Mr Les Johnson:

Thanks first off to you and your design team for taking the time out to show the communities the plan this past Wednesday night at Ayres Hotel.

I am a CPE resident who resides close to the project as I live in this over 1700 home tract since 1988 with my husband (who are now adults). I know the project is proposed to lay on Los Alamitos property at the old West Ed property. Anyhow since the land behind it is federal property and leased to the City of Seal Beach I think it's valid that you listen to what we have to say as well as anyone living in the city of Los Alamitos because it affects us all. It also will affect Rossmoor, Cypress, and Garden Grove.
My comments are as follows:

1. Arbor Park has always only had one way in and one way out. Looking at the map from Alan the architect it shows that there are a few open walkways right into Arbor Park. This is not allowed legally because I have told it's federal land. It is opened at the main gate near Heather St in the daytime by a Seal Beach official and at night it's always closed by a federal rep. At dusk it's always closed for the night. No one is allowed in Arbor Park per the Army Corp of Engineers I have been told.

2. The parking in Arbor Park has and always will be full as soon as there is soccer or dog park people. This clashes often and that is when there are well over 200 parking spaces that West Ed allowed people to park since a very long time ago. It was always practice to allow it because you can see clearly if you go to Arbor Park how quickly it gets filled. We need better parking at Arbor if this is truly going to be a project that helps communities get on that field at Arbor Park.

3. I think it's fine that there are two parks within the complex that helps the people who will be living there but Arbor Park is where their kids will be playing at most often because it's wide open.

4. Parking spaces that the architect showed me isn't sufficient for the project. Originally in the April 11th conceptual plan it shows 580 spaces and then in the current one they showed us it said 556 spaces. Why? These spaces are still insufficient and as we all know there will be more needed for the apartments. This was proven when there was a fight for LA Fitness to not be next to a complex in Rossmoor. Those condos were originally with one parking space but then that changed when people had two cars. Then they parked the overflow at the shopping center on the other side of the building because they had no other parking. You see what I mean by you need to think about parking within your complex better. Anyhow even if there are parking spaces added that still means there was work to be done to help Arbor Park itself.

5. Concerning the left turn lane at large, main entrance, I can't believe one believes that it's the best way to move the flow of traffic to a lane that at certain points of the day will clog up Lampson. How do you

propose the safety too for that when cars clog the left lane on Lampson? That's not the stagnant lane..it's the passing lane! Since there is no third lane on Lampson this makes it difficult to move approximately 500 cars a day into and out of that complex without causing destruction. Stop lights will also create a cluster btw. This is proven at every stop light we currently have just coming out of our over 1700 home tract.

I have indicated key parts in this letter and I know I will have more questions but for now this is it. Thanks for reading.

Sincerely,

Enea Ostrich

Subject: Lampson Park Place Project Concerns

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender jefftilson.77@gmail.com

Hi,

My wife, my 3 young kids, and myself are residents of College Park East, Seal Beach and we feel the proposed development on Lampson Ave. has some major concerns that haven't been addressed:

Lack of parking for the proposed community:

Resulting in 250-plus cars parked in our neighborhood every night:
Garage parking is used for storage and not parking
Parking at Arbor Park will be impacted (Dog park/AYSO soccer). Parking will be used by residents during the day.
Vehicles will park all around Heather Park, which will limit parking for visitors.

Impact on Heather Park:

Only 14,000 sq feet of open meeting space with no play structure
Residents will be crossing Lampson Ave. to walk to Heather Park which will be a safety hazard.
Heather park is already overused and in terrible shape.
Impact on tennis courts.

Traffic Safety on Lampson:

Lampson Ave. does not have street parking and a sidewalk on one side of the road.
Vehicles will all have to make right turns when leaving the development, significantly increasing U-turns and cut-through traffic at Heather Dr.
There have been many serious and fatal traffic collisions on Lampson, which will increase.
Limited visibility when residents exit CPE onto Lampson Ave. will cause more collisions.
Lack of visibility for vehicles approaching U-turns at intersections.
There is not enough room to make U-turns at Heather Dr. and Lampson, resulting in 3-point turns.

Other concerns:

Children's safety
Heather Park is the main pick up and drop off stop for the school buses, the increased traffic will create additional hazards when the busses are stopped with red lights flashing
Water runoff (flooding)

Lampson Ave floods easily during storms and additional housing and construction will cause additional flooding
Utilities (internet, electricity, sewer)
CPE already has spotty internet with the Military Base Interference, more users will cause more disruptions and impact service
Police Response
The planned Community is under the City of Los Alamitos, however, Seal Beach will be heavily utilized/impacted for accidents on Lampson or called for additional issues (ie parking or disturbance issues) in CPE
Density of project.
In the affordable housing: 1 bedroom can house 1-3 people
2 bedrooms can house 3-5 people
3 bedrooms can house 4-7 people

Thank you for your consideration and look forward to hearing how these issues may be resolved if the project moves forward.

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender MMelendres@acta.org

To whom it may concern,

We have been residents of College Park East since 2002. This letter is to request that you stop the Lampson Project. The project is not taking into consideration many negative environmental effects on our community.

The project will not add anything to our community but will affect the quality of life for our families. Lampson is not designed to take the proposed project. It is a small street that already causes traffic issues. We moved to CPE because of its location, which is not on a main thoroughfare. Moving forward with such a project will create noise pollution and will become unsafe for our children.

Thank you for your consideration.

Regards,

Scott & Maria Melendres

Subject: Lampson Project Comments

Hello everyone,
I am a resident of College Park East (CPE) at 4548 Fir Ave, Seal Beach, and I would like to write you to oppose the project for 4665 Lampson Avenue for the following reasons:

- The new project would increase traffic on Lampson to an unsafe level increasing accidents and injuries. Lampson is already one of the most dangerous streets in Seal Beach / Los Alamitos.
- Vehicles exiting the development are only able to turn right towards Seal Beach Blvd, which will greatly increase the amount of U-turns on Heather Ave. This is extremely dangerous and potentially deadly. Heather park is heavily used by children in CPE, sports teams, and is a major school bus pickup and drop off location. Traffic accidents and children/pedestrians being hit by vehicles will only increase.
- Overflow parking from the development would overflow into CPE, reducing available street parking to CPE residents.
- The construction noise and road closures are also a concern. We have already had to endure the noise pollution and increased construction traffic from the 405 freeway expansion for the last couple of years.
- The proposed project plan is over-crowded. Too many units in a small area, not enough parking in the development, and no parks or play equipment in the development.
- Arbor Park will not have enough parking spots for the hundreds of families who attend AYSO soccer at Arbor Park. AYSO region 159 is an amazing organization who has been in the community for decades and have used Arbor Park for decades as well. The reduction of parking caused by the proposed unit project would jeopardize the success of playing soccer at Arbor Park and will negatively affect the children and families of our community.

I am asking you will take into account the concerns of CPE residents and the detrimental effects this project would have on the quality of life for CPE residents, AYSO region 159, and the children, and not approve the 4665 Lampson Ave development project.
Thank you,

Derek Berger

Hello, good day.

I would like to suggest building a sound wall on the Los Alamitos side of the Lampson Project to help muffle the noise which so many new residents will inevitably generate into the now peaceful neighborhood of Seal Beach College Park.

I would like to suggest not building quite as many new homes, thereby making room for a park in the new development.
It is important.

Lastly I would ask that the developers provide funding for anyone in the Seal Beach College Park area, whose backyard fence borders Lampson, so that those residents may heighten their backyard fences to the maximum height allowable at no cost to the residents themselves.
The developers should also provide funding for air purifiers for those Seal Beach residents, as the air quality will suffer greatly with the influx of so many additional vehicles.

Thank you,
C Reynolds

Subject: Re: Lampson Project Comments

Good morning. I have listened to many of the comments and agree with them. I also would like to add that the freeway at seal beach Blvd seems to be a dangerous one. I think with the 22 405 and that on off ramp we have most of the accidents of the 405. Can we really add that many more people getting on and off and rush hour. Just something to look at please. Thanks for your consideration. Teresa Werner.

IRONSCALES couldn't recognize this email as this is the first time you received an email from this sender shellandheathersmom@yahoo.com

Please consider all the traffic for lampson. We are very much against a large development that this was not zoned for. Seal beach Blvd is already too crowded and this will even cause more problems. Can our schools handle all of this too? Our college park neighborhood doesn't want the traffic it will cause either! I know California is working to provide housing but this high density hurts everyone. We did not pay high housing prices to have this happen to our area. Do we have enough emergency services, parks, libraries, schools? I hope the community is more important than developers making a lot of money. Please consider all of this in your plans. Thank you. Teresa Werner 3800 wisteria street seal beach. 562 822-2012.

Subject: Re: Stop Lampson Project

Dear Council Members,

I am writing you again to voice my concern for the Proposed Lampson High Density Project. As was voiced last night by multiple residents, there are serious concerns about the negative impacts this project will bring to our community.

When making your decision, please ask yourself the following... if I lived near this proposed high-density project would I want it? How would it affect my family, my safety, and my quality of life? Please put yourself in the position of the existing residents that you represent and consider a No vote on this project. Or, at the very least please reduce the size by half as it is out of character and scale with our already overpopulated community.

Sincerely,
Dara Baddeley

Subject: Stop Lampson Project

Dear Council Members,

I am writing to express my strong opposition to the high density housing development that is being considered to be built on Lampson. This project causes major concerns over the addition of multi-family housing leading to more people, significantly increase traffic congestion, noise, pollution, decrease in safety as well as a reduction in property values of the existing community. Heavy traffic on Lampson is already common during morning rush hour and critical times of the day; with an additional 240 plus high density housing units Lampson could not accommodate traffic from the additional cars. From discussions with my neighbors my opinion is shared by many families who live in our community of College Park East in Seal Beach. This development will negatively impact our neighborhood and quality of life. I urge you to disapprove and stop this plan from moving forward.

Sincerely,
Dara Baddeley

RE: WestEd Development Project

To Whom It May Concern:

My wife and I, who live in College Park East, would like to express our great concern regarding the proposed project at 4665 Lampson Ave. (WestEd). While we support the need for increased housing, the proposed project, as we see it, will significantly increase traffic on Lampson and potentially increase the number of motor vehicle accidents.

As our home backs up to Lampson, we have witnessed numerous accidents on this street, at least three of them fatal. In addition, our block wall was breached when a car lost control sending pieces of block wall right up to the back of our house. At the time, we had small children. This has happened to numerous other residents along Lampson Ave. as well. We believe the expected increase in traffic will only increase the likelihood of additional accidents.

Furthermore, as proposed, the project does not include the ability to turn left upon exiting the proposed site. It is highly likely that many residents will attempt to make a U-turn at the intersection of Lampson and Heather where the accident rate, already high, can be expected to increase significantly.

Additionally, the project as proposed, does not include adequate parking for its residents and their guests. It is expected then that residents and guests will be forced to park somewhere in College Park East where the parking is already crowded.

We believe it is essential to address and remedy these issues so that the new housing doesn't result in increased traffic accidents on Lampson Ave. and street crowding in the adjacent community of College Park East.

Sincerely,

Aaron and Leslie Kern

DENSITY BONUS LAW REQUEST

Lampson Park Place
4665 Lampson Avenue
Los Alamitos, CA 90720

To: Ron Noda, Development Services Director, City of Los Alamitos

From: Scott Birkey, Cox, Castle & Nicholson LLP

Cc: Les Johnson, T&B Planning, Inc.

Date: March 30, 2023

We represent Lampson Park Place, LLC ("**Applicant**") in connection with its Lampson Park Place Project ("**Project**") located at 4665 Lampson Avenue in the City of Los Alamitos ("**City**") on APN 130-012-35. On behalf of the Applicant, we submit this Density Bonus Law Request pursuant to the State's Density Bonus Law (Government Code Section 65915) and the City's Municipal Code (Municipal Code Section 17.28.050).

Project Background

Currently, the Project site is designated "Community & Institutional/JFTB" as shown on the City's General Plan Land Use Map (Figure 3 at p. 33), and the site is zoned "C-F: Community Facilities" as shown on the City's most recent Zoning Map. We understand that the City intends to process a General Plan Amendment to re-designate the Project site as Limited Multi-Family Residential and a Zoning Map Amendment to rezone the Project site as Residential R-3.[1]

As described in more detail in the application package, the Applicant proposes to redevelop the Project site with a residential development consisting of a variety of different product types, including cluster homes, townhomes, and apartments. The unit mix would include cluster homes, townhomes, and 77 multi-family apartment units restricted to low income and with one unrestricted manager's unit. The overall density for the Project will be 20 dwelling units per acre, and the maximum building height will be 38 feet. The Project will provide approximately 21,000 sf of common open space, which includes a central 14,000 sf neighborhood open space area.

The Project will provide a total of 577 parking spaces consisting of 475 parking spaces for the cluster homes and townhomes, and 102 parking spaces for the affordable multifamily apartment homes. Vehicle access to the Project site would be provided via two driveways on Lampson Avenue. Non-motorized circulation will include connectivity with existing sidewalks along Lampson Avenue, including signalized pedestrian connection to the south at Rose Street and Lampson Avenue, and pedestrian "paseo" connections with Arbor Park and the Arbor Dog Park to the north. Redevelopment of the

---

[1] This Density Bonus Law Request, and the analysis below regarding the Applicant's requested concessions and waivers, assumes that the development standards of the Residential R-3 Zone set forth in Section 17.08.030 of the City's Municipal Code will apply to the Project site.

Project site would require demolition of the existing 2-story 88,000 square foot office building located on the property.

Further details regarding the Project can be found in the accompanying Project applications materials.

Density Bonus Law Requests

Pursuant to Section 65915 of the Government Code and Section 17.28.050 of the City's Municipal Code, Applicant makes the following requests for the Project.

A. ***Increased Density Request***

Density Bonus Law Requirement

The State's Density Bonus Law specifies that for housing developments in which 24% or more of units in the development are low-income units, the local government must allow a 50% density bonus (Gov't Code Section 65915(f)(1).)

Request:

Because of the density authorized under the Density Bonus Law, and assuming the maximum density of 25 dwelling units per acre pursuant to the Residential R-3 Zone, the Project could obtain a density increase of 154 additional units for a total of 462 units on the site. However, the Applicant has determined that the Project can accommodate the proposed number of units based on the allowed density of the Residential R-3 zoning requirement. Therefore, at this time the Applicant is not requesting a density bonus.

B. ***Concession Requests***

Density Bonus Law Requirement

The State's Density Bonus Law specifies that for housing developments in which at least 24% of the total units are for lower income households, the local government must allow three incentives or concessions. (Gov't Code Section 65915(d)(2)(C).)

Request

The Applicant requests three concessions pursuant to the State's Density Bonus Law:

Concession #1: Reduction in Setback Distance Between Structures

Concession #2: Exception for Building Step Back Requirements

Concession #3: Reduction in Minimum Storage Space

Rationale

As to **Concession #1**, Section 17.08.030, Table 2-03 of the City's Municipal Code requires a 10-foot minimum distance between structures. Though most of the Project's single-family residential setback distances between structures meet or exceed the minimum distances, at certain locations within the Project site plan, the setback distance is 6 feet. Meeting the required 10-foot minimum setback distance would require a significant change to the site plan and likely result in a reduction of residential

units. As such, the Applicant is requesting as Concession #1 that the setback requirement in certain locations identified on the site plan be reduced to 6 feet.

As to **Concession #2**, Section 17.08.045.A.1 of the City's Municipal Code requires that for buildings higher than two stories, the third story must have a minimum 5-foot step back from the story below to minimize building bulk and create façade articulation. This requirement appears to govern regardless of building location within a project site or surrounding land uses. We understand that City staff interpret this requirement as applying only to perimeter buildings, i.e., buildings that are located along the perimeter of a project site. Nonetheless, given the requirement's ambiguity, the Applicant is requesting as Concession #2 an exception from the required minimum 5-foot step back requirement for those structures identified on the site plan.

As to **Concession #3**, Section 17.08.030, Table 2-03, of the City's Municipal Code requires a minimum storage space in a garage or carport of 200 cubic feet per unit. For certain units within the Project, this storage space requirement will be difficult to satisfy because of limitations in garage and carport space. As such, the Applicant is requesting as Concession #3 that the minimum storage space requirement be reduced to 175 cubic feet per unit for market rate units and 50 cubic feet per unit for affordable units identified on the site plan.

C. Waiver Requests

Density Bonus Law Requirement

The State's Density Bonus Law specifies that an applicant may submit to a local government a proposal for the waiver or reduction of development standards that will have the effect of physically precluding the construction of a development providing the requisite amount of affordable housing at the densities or with the concessions permitted under the Density Bonus Law. A waiver request can be denied only if the waiver would (i) have a specific, adverse impact upon health or safety, and for which there is no feasible method to satisfactorily mitigate or avoid the specific adverse impact; (ii) have an adverse impact on any real property that is listed in the California Register of Historical Resources; or (iii) be contrary to state or federal law. (Gov't Code Section 65915(e)(1).)

Request

The Applicant requests one waiver pursuant to the State's Density Bonus Law:

Waiver #1: Reduced Common Area Requirement

Rationale

Section 17.08.030, Table 2-03 of the City's Municipal Code requires a minimum 200 square feet of common area and 60 square feet of private space per unit. The Project will be able to comply with the minimum private space requirement, but the Project will not be able to comply with the common area requirement. This is because of City requests that the Applicant dedicate the northerly 10 feet strip of land abutting Arbor Park and Arbor Dog Park, which comprises an area of approximately 10,000 square feet of property. If this area is dedicated to the City, then the Project will be unable to comply with the common area requirement because compliance with this requirement would physically preclude construction of the Project at the densities allowed and with the concessions described above.

Therefore, the Applicant is requesting as a waiver a reduction in the common area requirement of150 square foot per unit.

D. *Parking Reduction Request*

Density Bonus Law Requirement

The State's Density Bonus Law specifies that for housing developments that qualify for a density bonus the local government shall not require a vehicular parking ratio, inclusive of parking for persons with a disability and guests, that exceeds the following ratios: (A) zero to one bedroom: one onsite parking space; (B) two to three bedrooms: one and one-half onsite parking spaces; and (C) four and more bedrooms: two and one-half parking spaces. (Gov't Code Section 65915(p)(1).)

Request

The Applicant requests that the City require no more than 2.35 spaces per unit for a total of 577 parking spaces for the Project, which is significantly more than the number of parking spaces that would be required pursuant to the State's Density Bonus Law.

Rationale

Pursuant to the State's Density Bonus Law, the following number of parking spaces would be required for the Project:

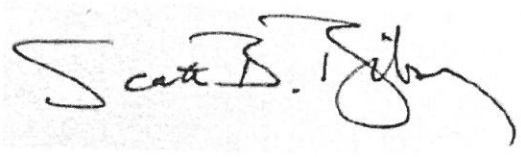
- 36 one-bedroom units x 1.0 onsite parking spaces = 36 spaces
- 122 two- to three-bedroom units x 1.5 onsite parking spaces = 183 spaces
- 88 four-bedroom units x 2.5 onsite parking spaces = 220 spaces
- Total = 439 spaces

However, the Project proposes to provide more parking than is required by the State's Density Bonus Law. Instead of 439 parking spaces, the Project will provide a total of 577 parking spaces, which is approximately 2.35 spaces per unit, and is 138 parking spaces more than would be required for the Project.

E. *Project Confirmations*

In addition to the concession, waiver, and parking relief identified below, we wish to confirm certain understandings with the City as to the Project's compliance with other specified development standards to clarify any ambiguity and ensure a common understanding.

Height Requirements



Sections 17.08.030 and 17.16.040 of the City's Municipal Code govern maximum building height, height measurement, and exceptions. Building heights for the Project are expected to exceed the Code's 35-foot maximum building height. However, this is due to the placement of HVAC equipment in the roof structure (attic space). The Applicant understands that this qualifies as an allowed projection, which can project up to 6 feet above the maximum building height pursuant to Section 17.16.040.B of the City's Municipal Code. The Applicant estimates that the maximum building height for the Project will be approximately 38 feet with the addition of this HVAC equipment in the roof structure. The Applicant

requests that the City confirms the Project's building height is consistent with the City's Code requirements and that no relief from these requirements is necessary.

* * *

Please do not hesitate to contact the Applicant or me should you have questions regarding any of the above. We look forward to working with you on the Project.

Best regards,

Scott B. Birkey
